

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

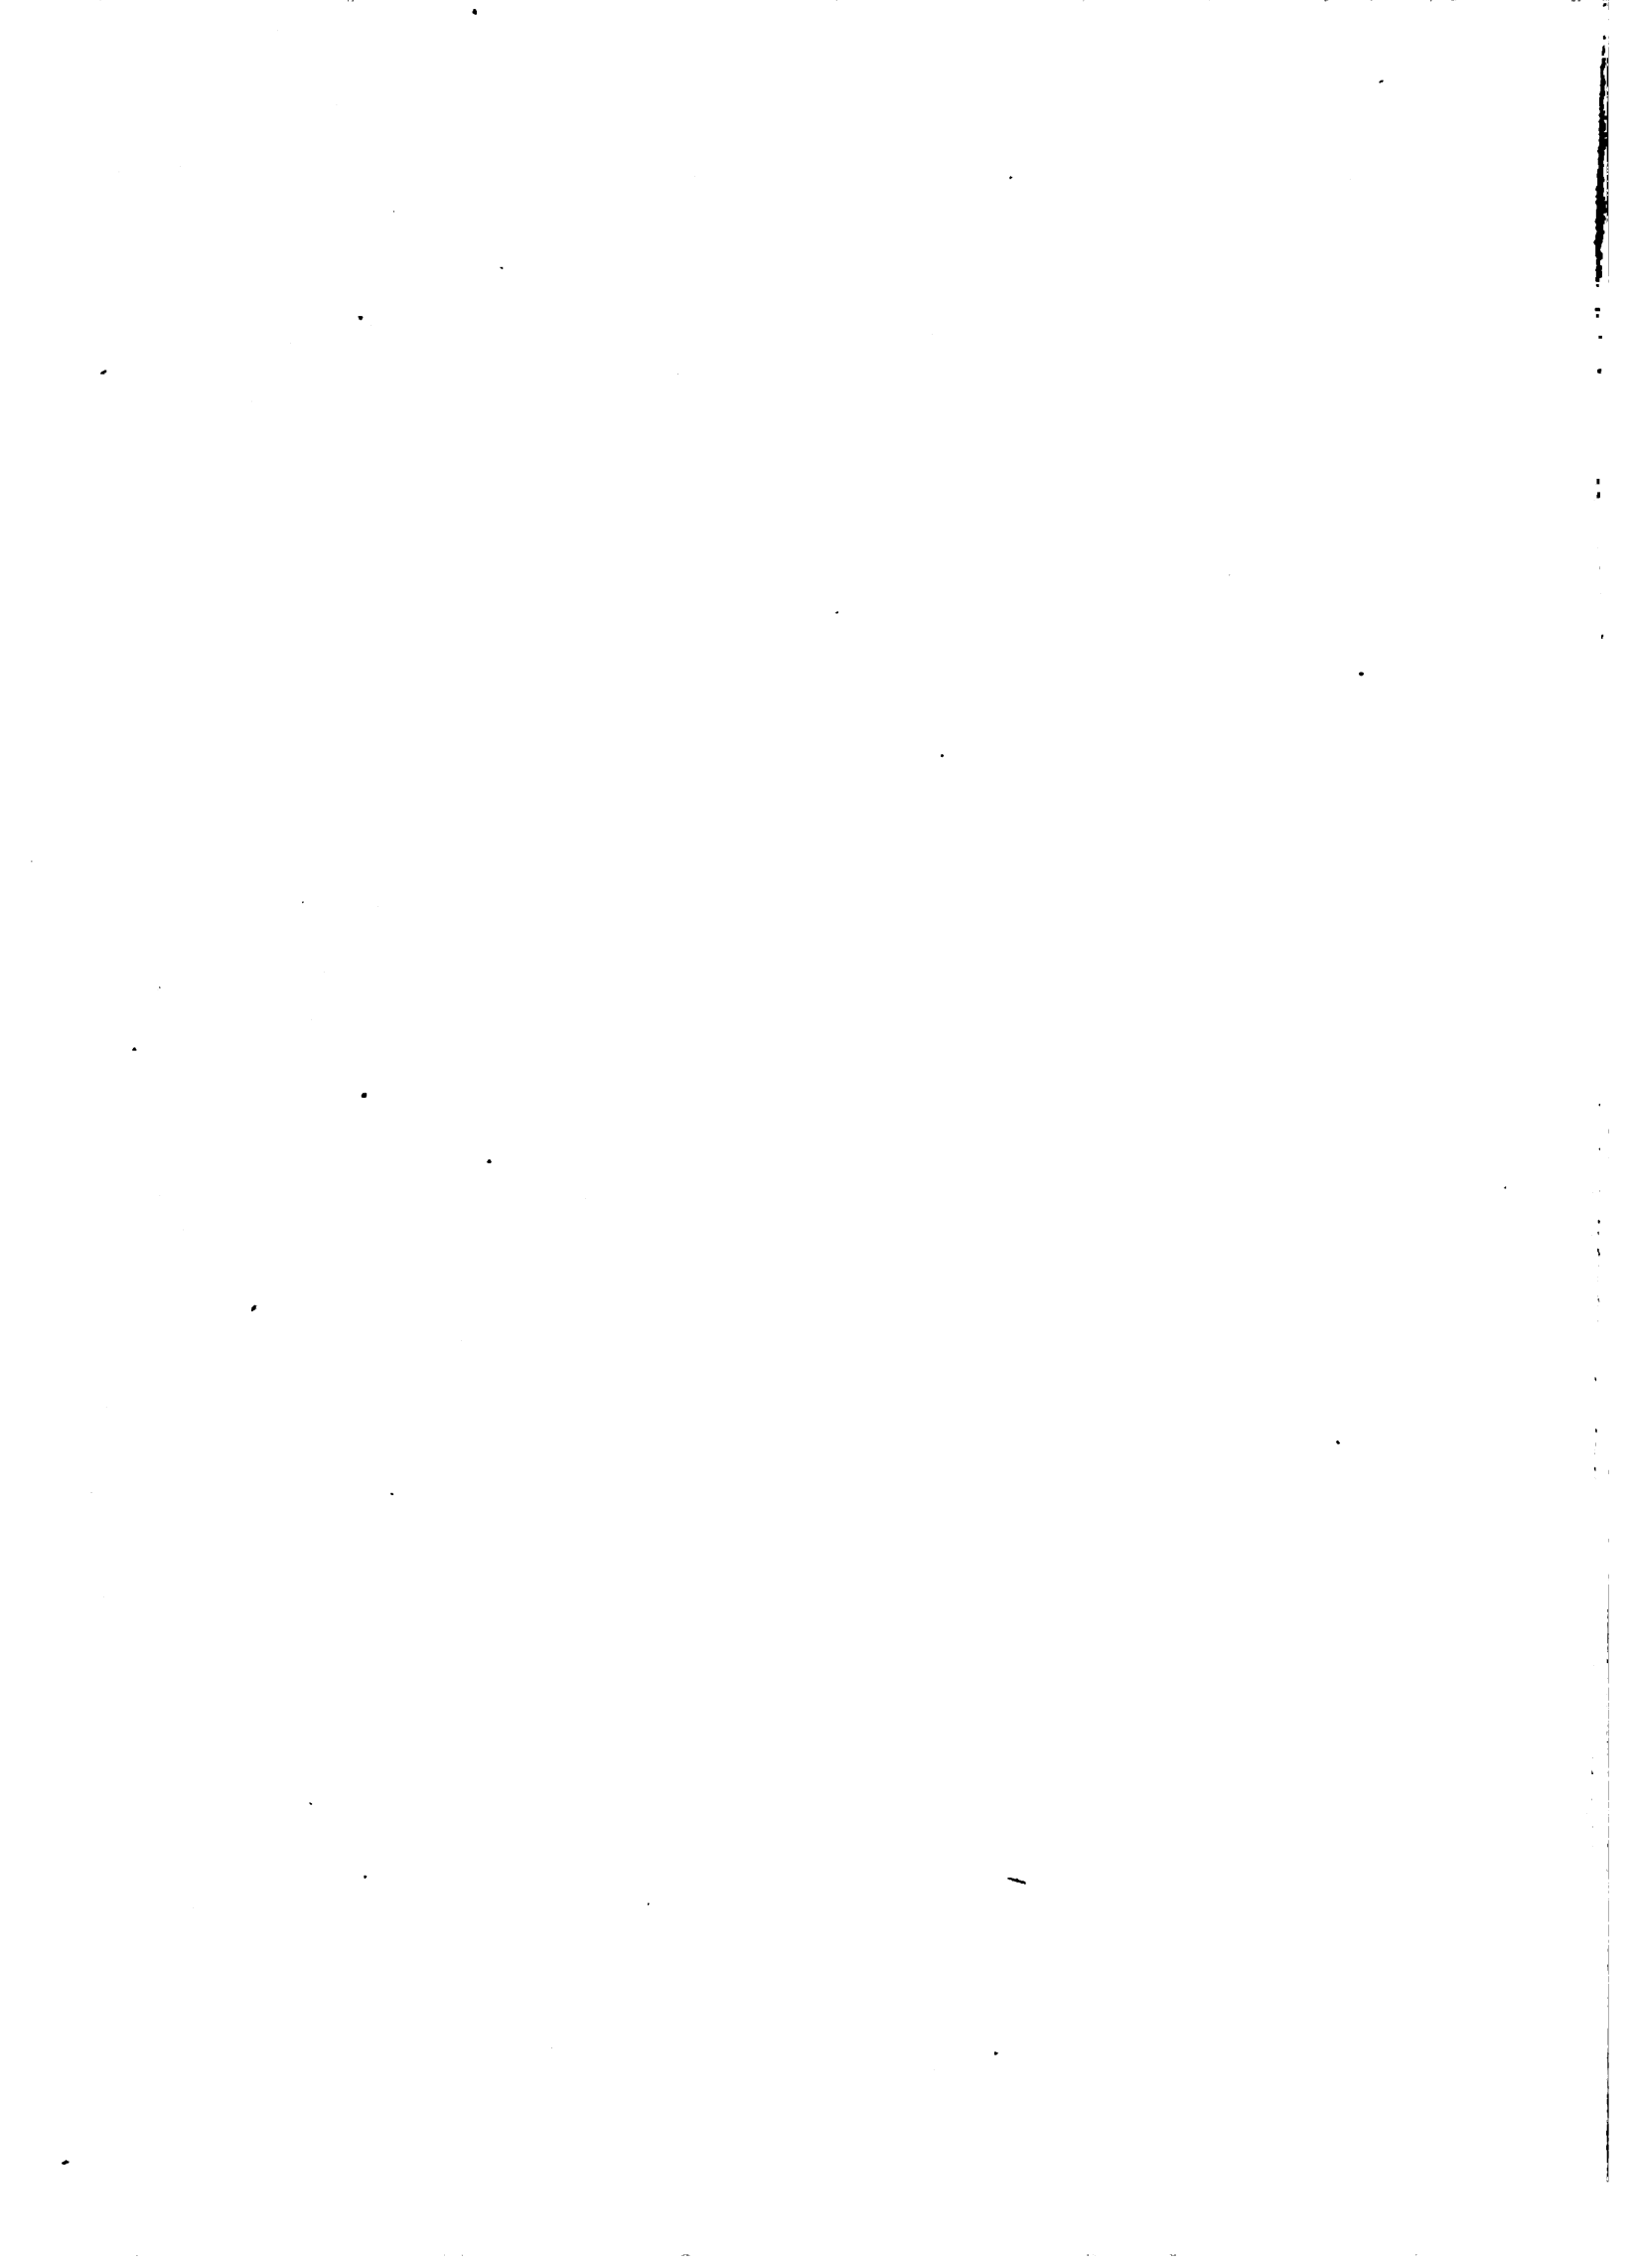

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

# INDEX TO VOL. IV., PART I.

**A.**  
Acts of Congress, list of, passed in the second session of the 23d Congress, 142  
Address of the Editor, 1, 409  
Affection, pure and real, 1  
Agriculture, 22, 118, 153, 154, 184, 246, 344, 359, 377  
Agriculture, political, 140  
Alleghany River, improvements in, 337  
American Patents, 99, 198, 214, 295, 356  
Antiquities of America, 29

iciency of it for the trade of N. York, 164, 296  
Erie and Champlain, amount of business done at Albany, 400  
Chesapeake and Ohio, 97; Report made to Baltimore Convention on the probable revenue of, 57 to 60, 353  
Hudson and Ontario, 129  
South Carolina, Report of, and of Railroad Company, 6  
New-York, state of, Report of Commissioners respecting, 291, 292

**D.**  
Davis, Phineas, specification of his Patent for improvements in chilling Cast Iron Wheels for Railroad Cars, 147  
Draught, by horses and other animal power, 167  
Dufresnoy's Report to Directors of Bridges, Mines, and Roads, on the Use of Hot Air, 166  
Dundonald (Earl of) Revolving Steam Engine, 182

It will be observed, on examination, that No. 45, 46, 47, 48, 49 are not paged to correspond with the Volume. They contain precisely the same reading in relation to Internal Improvements, without the miscellaneous reading; and were put up, in half sheets, for a special purpose; but in consequence of the loss, by the late fire, of the whole sheets bearing those numbers, I am compelled to use these half sheets in lieu of whole sheets, or not be able to complete any more copies of Volume FOUR. *Not is deficient 8 pages.*

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, JANUARY 10, 1835.

With this number we commence the 4th volume of the Railroad Journal—which we hope to make more interesting, or at least more valuable, than either of the preceding.

The subject of Internal Improvements begins to attract more than usual attention, as its benefits are more widely extended and more duly appreciated. We hope, hereafter, to find more co-laborers with us in the field, and an increased number of patrons throughout the country. The latter we must, and are resolved to have; and, as an inducement, we offer those who are at this time subscribers, who will take a complete set of the Journal, from commencement up to the 3d instant—or close of the 3d volume,—stitched in half yearly parts, with Title Page, Index, and Cover, to each, and a Railroad Map folded into volume 3d—for SIX DOLLARS; and to those who will now become subscribers, and take the full set from commencement to the end of the current, or 4th volume, with the Map folded into the 3d, for TEN DOLLARS.

We are induced to make these offers by a desire to have it more generally circulated, and to be able to render it more valuable hereafter to those who read it.

☞ We can hardly afford to pay Postage on new subscribers, and payments in advance; how much less, then, can we afford to pay Postage on orders to discontinue the Journal? It is much to be desired, therefore, that the postage on letters should be, as it is, in numerous, we may say most, instances, paid on letters addressed to us on business relating to the Journal.

☞ The communication of —, with its enclosure came duly to hand. The address with which he finds fault, and justly so too, so far as it is connected with the Railroad Journal, was distributed without our knowledge, by the carrier, who made use of an address prepared for another paper,—to which he is also a carrier,—by altering the head.

GOVERNOR'S MESSAGE.—We have received the Message of the Governor of this State, delivered on the assembling of the Legislature. It is an able document. It does not, however, take that decided stand in favor of the great works of Internal Improvement in contemplation, which we hoped it would.

NEW-YORK AND ERIE RAILROAD.—We give in this number of the Journal the proceedings of the Railroad Convention, held at Bath, Steuben county, on the 17th December. The preamble and resolutions are in the true spirit. They evince a due appreciation of the great advantages of Railroads, as well as of the peculiarly favorable position, circumstances of the route through the Southern tier of counties, and also, of their rights as citizens of the State of New-York, which has done so much for other, and so little for their, section of the State; and must, we would fain believe, convince the members of our Legislature, as well as all others of liberal views, that, in a spirit of JUSTICE at least, if not in that of an enlightened policy, they are bound to give it the countenance and aid of the State.

Calhoun county, Michigan Territory,  
Eckford, December 10, 1834.

To the Editor of the Railroad Journal.

SIR,—I enclose you five dollars on account of the Railroad Journal, a work with which I am highly pleased. I had intended to have prepared a communication for it in relation to a railroad through this Territory, but time has not permitted; and I can now only say that the United States' Engineers have just surveyed a route commencing at Detroit, and thence running nearly west to the mouth of the St. Joseph's, on Lake Michigan, distance 180 miles, mostly through an open flowery region, of great fertility; and although the country is very new, it is settling with great rapidity. This road will give a further spur to it, and will extend the facilities of transportation to the Mississippi. It will only be required to complete the canal, or railroad, from Chicago to the rapids of the Illinois, when a continuous line will be open from New-York city to St. Louis, bringing those two places within 8 or 10 days of each other.

The route through this peninsula just surveyed is peculiarly favorable, the greatest elevation over which it passes being 448 feet near the centre; and from this point, either way, the surface is a gentle inclined plane, facing the east and west, of above 90 miles each.

Will you have the goodness to state in your Journal the rate of tolls on the various railroads now in operation, also as compared with the tolls paid on the canals. It will serve to remove the doubts and prejudices of many who believe that railroads are not adapted to the transportation of heavy produce, especially when the distance is great.

I am, very respectfully, your obedient servant,  
A. W.

The suggestion of our correspondent, A. W., is an important one, and we will give the favor of those of our subscribers, who have the means of furnishing the desired information, to communicate it to us at an early date. Particulars relative to the tolls both on railroads and canals, are desired.

Affection.—Real and pure affection is always quiet and deliberate in its attention, and no man of refinement can long love a wife whose demonstrations of attachment are obtrusive and impetuous.—[Mrs. Hale.]

The following very important collection has been furnished us for publication. It exhibits the value of our internal communication in a new and clear light than it has hitherto been. This statement (made, it is true, only from documents, but it is believed estimate of 33½ tons to each lockage entirely within the truth,) it will be perceived that the amount of tonnage in 1834 Erie Canal alone, which passed Alexander's lock, exceeds the whole amount of both foreign and domestic, of the New-York for 1833.

"The immense and increasing tonnage of our Erie Canal almost exceeds belief, and will readily account for the steady

Statement of the number of American and cleared from the Port of New-York in 1834.

Date.	Foreign Arrivals.	
	No. of vessels.	Tons.
First Quarter, 1833,....	53	11,4
Second " " "....	167	35,1
Third " " "....	212	40,7
Fourth " " "....	181	23,3
	553	110,5
	1365	290,0
In 1833,.....	1918	430,3
First Quarter, 1834,....	43	8,5
Second " " "....	178	42,7
Third " " "....	142	25,5
Fourth—not ascertained.		
	363	77,7
	1159	271,5
In 1834, (in part,)....	1522	349,5

The official statement of the boats of timber passed at Alexander's lock is not yet published; but to the first of September it was 12,551, and it is understood to exceed 24,000 to the close of navigation, equal to a lockage every 12½ minutes, and only allowing the moderate ratio of one ton to a lockage of boat or float of it will give 800,000 tons, without taking into view the large amount of trade in wheat, and lumber, between Buffalo and Alexander's lock.

But, to set the question at rest, I will compare you with the Collector of Utica's statement of the comparative view of property passed Utica on the Erie Canal the years 1833 and 1834. By this table will ascertain that 420,000 tons were actually floated by Utica during the season of navigation, seven and a half months will fully equal the weight carried by 1918 vessels, entered and cleared from Custom House, when it is taken into consideration that more than one-third were in ballast, or were only partially loaded.

By this interesting table it will be perceived, that 1,157,059 barrels of flour passed Utica which, with 1,197,304 bushels of wheat, are equal to 1,425,000 barrels of flour, equal in value, delivered at Utica to seven and a half millions of dollars. Cotton, we perceive 1,221,102 lbs. Merchandise, 140,743,996 lbs.—while the other items in this statement, exceed fifty millions of dollars, valued at only \$300 per ton.

It will be noted that the high tolls have decreased the amount of lumber, early ship timber, an important item landed interest in the interior.

th inst. inclusive, during which period there were at this office for Tolls, &c. \$58,366 44. On account for 1834, it will be perceived there were of articles that do not appear in that list is owing to there not having been any receipt of these articles, in consequence of there being any heading for them on the blanks for that year. The decrease in Merchandise, about 4,550,000 pounds, by articles heretofore placed under that heading, having a heading for them in the blanks for 1834.

Respectfully, your ob't servant,  
THOMAS M. FRANCIS.

statement, for which we are indebted to BLOOMFIELD, Esq., of Utica,—who has been a very active part in promoting the use of internal improvement,—will only surprise many of our most obdurate citizens, who, although ever ready to the favorable influence of our Canal upon this city, and especially upon its estate, have not, as we believe, fully appreciated the importance of increasing facilities, by enlarging the Canal and the construction of Railroads, for communication with the FAR WEST.

The time has arrived, however, when every intelligent man must see and feel the necessity of action. The period has passed, and the field is ample. In the western part of the State, a route for a canal has recently been surveyed, and has been found favorable beyond the expectations of its warmest friends—a route which will, we understand, be presented to the Legislature at an early day. North, or in the vicinity of the Erie Canal, a STEAMBOAT COMMUNICATION with Erie, if the determined perseverance of our friends and an enlightened public prevail, will be opened at an early day.

These are works which, when fully completed, will do credit to the State of New-York—in truth, the *Pioneer* of works of internal improvement in our country. With a steamboat canal for bulky products and heavy articles of which will at the same time compete with our Canadian neighbors on the North—Railroad for the hundreds of thousands of passengers, and light freight, shall compete with our persevering rivals of Pennsylvania, by being in operation in twelve months to their nine,—will do to the city of New-York an amount of trade, the estimate of which, at this enlightened day, would cause no one to venture upon it to be considered a fit subject for a "straight jacket," or a natic asylum.

It is however are the facts, and he who compares a quarter of a century with the present day, as many who can compare the present with the year 1810, have abundant reason to exclaim, "the fact is not told us;" and by way of illustration in a very small degree the truth of our predictions, we will state a few facts in relation to the increased value of property. Building, a mere shell of an old rookery, which this Journal is published, was in 1816, during a life, for \$500 per year—it now rents for \$3000! more, we can easily feel, than it is worth, with the

government between distant portions of the republic; and as a route for the speedy and regular transportation of the public mails; and that as such it merits the favorable regard of the National Authorities.

Resolved, That the citizens of the southern tier of counties, from their liberal support of the Erie Canal, and other public improvements, from the construction of which they have derived no advantage, while other portions of the State have been enriched and made prosperous, have strong and irrefragable claims upon the Legislature for a just share of its patronage and bounty; That we recommend to the citizens of said counties, and the counties adjacent, that immediate measures be taken in each respectively, to press upon the Legislature their claims upon the State in the construction of the contemplated Railway.

And, whereas, we are advised and believe, that in case the Legislature will pass a law, authorizing a subscription of two millions of the stock, or loan its credit to that amount for the benefit of the Stockholders of said Railroad Company, that the residue will be taken by individual in the city of New York, and along the line of the proposed road, and the work immediately progress to a completion. Therefore

Resolved, That this Convention do memorialize the Legislature of this State at the ensuing session, for the passage of a law authorizing said subscription or loan, as shall by the said Legislature be deemed most conducive to the public interest.

Mr. Gibbs, from the Committee appointed for that purpose, reported a memorial, a copy of which is annexed to these proceedings. Whereupon it was unanimously

Resolved, That the said memorial be adopted, and that the same be signed by the members of the Convention.

Resolved, That we earnestly and respectfully recommend to the citizens of the southern tier of counties that petitions in accordance with the views and objects of this Convention, as expressed in its resolutions and memorial, be immediately prepared and circulated in all of the said counties with a view to an early and efficient application to the Legislature at its ensuing session.

Resolved, That William S. Hubbell, William W. McCay, and Henry W. Rogers, of Bath, in the county of Steuben, be a Central Corresponding Railroad Committee.

Resolved, That the proceedings of this Convention be signed by the officers thereof, and that the editors of the several newspapers in this State be requested to publish the same.

The following is an account from the Troy Budget of the Railroad now constructing between Troy and Ballston.

The road leaves Troy at Federal street, by the aid of the bridge which crosses the Hudson river, extending from that street to Green Island. The length of the bridge is 1600 feet. It forms eight arches, exclusive of a capacious draw section. The piers, or abutments, are cut stone from Glen's Falls, Poughkeepsie and Amsterdam. The bridge will stand 30 feet above high water mark. Its frame, built of timber, will be 24 feet wide, and well covered.

From the bridge to Waterford, four and a half miles, the railroad crosses three spans of the Mohawk river upon durable bridges erected upon stone abutments. Passing directly through Waterford the road follows along the margin of the Hudson to Mechanicville, eight miles. From thence it varies and runs westerly twelve miles to Ballston Spa.

The whole line of the road from Troy to Ballston, save one mile of easy construction, is graded and prepared for the reception of the rails.—The greatest ascent in any one mile on the line of the road is 25 feet. On the first 13.3 miles, from Troy to Mechanicville, the average ascent is less than 10 feet per mile.

The rails are to be of timber, laid on cedar sleepers, and covered with the usual iron-plated rails. These have been ordered long since, are supposed to be on shipboard now, and will doubtless be here early in the spring. Such is the pre-

pointed to nominate officers for the convention. Whereupon the chair appointed Messrs. Davenport, of Steuben, Charles, of Allegany, Smith, of Chataque, and Arnot, of Tioga, who reported the following nominations, viz.:

Hon. Stephen B. Leonard, of the county of Tioga, President;

Hon. Israel Day, of the county of Cattaraugus, and Alphens Hawley, Esq., of the county of Chataque, Vice Presidents;

Henry W. Rodgers, of Steuben, and Anson Gibbs, of Cattaraugus, Secretaries; who were unanimously appointed by the convention.

The convention was then addressed by gentlemen relative to the object for which called. Communications from public citizens residing in the counties Broome, Chenango, Otsego, Delaware, Sullivan, and New-York, were read to the convention; from which it meetings had been held in each of them in most of them numerous delegates attended this convention; but in consequence of the season, bad weather and the short notice given, the latter probably be unable to attend.

Committees were then appointed to prepare resolutions, and a memorial to the Legislature; which, after a short time, were reported, read, and adopted. Annexed, we give the preamble and resolutions. The memorial has not yet come to hand.

Whereas, we contemplate with just pride and pleasure the sagacity which conceived, and the wisdom and policy which consummated, that splendid monument of the enterprise of our State—the Erie Canal—an enterprise the completion of which constituted and continues to constitute one of the brightest eras in the history of this State, and which has given our country renown, even beyond the Atlantic,—and

Whereas we deem a judicious continuation of that grand system of internal improvements which has hitherto been so successfully practiced, and the rich benefits of which are every day more and more signally developing themselves, to be in accordance with the dictates of sound policy, as well in regard to the already conceded high reputation of our State for public spirit and enterprise, as to the prosperity and permanent interest of our citizens,—and

Whereas several rival works are now in contemplation, and some of them rapidly advancing to completion, leading into the State of Ohio from points on the Atlantic seaboard south of the city of New York, with a view to divert from that city the extensive and lucrative commerce which it has hitherto enjoyed with the rich and rapidly increasing States and territories north of the Ohio river, avowedly relying upon the greater severity of climate and more northerly latitude of the State of New York, closing the navigation of its canals during so large a portion of the year,—and

Whereas we deem it due to the character of the State, and to the interest of its enterprising citizens, to guard as far as may be, against those rival interests, by using the means which we have in our power, and availing ourselves of the advantages which nature has liberally placed within our reach, and believing as we do, that these objects can in no way be so effectually accomplished, as by the construction of the contemplated Railroad from the city of New York to Lake Erie, through the southern tier of counties,—Therefore

Resolved, That the proposed work commends itself with peculiar force to the people and to the Legislature of this State, and should excite zealous, vigorous and immediate action—that from its great extent, running as it will, if constructed, through the entire State from east to west, embracing in its route a fertile country, rich in natural resources, as yet but partially developed, and being strongly identified not only with the prosperity and interests of the State, but in the opinion of this convention, partaking largely of a national character and importance, as an avenue from the Atlantic seaboard to the waters, States, and Territories of the west, and to the public lands; as a medium of direct and rapid communication for the military forces and movements of the

present accommodations; yet not 7 per cent. upon what it would sell for at auction to-morrow, even without any building upon it, for it would be worth more without, than with, the present building, if it could be sold. We might also refer to the lot next but one adjoining us, corner of William street, which does not contain but a little over half as many square feet, but has two fronts—which was sold in 1823 for \$17,500, in 1833 for \$41,750! and again, as we understand, a few days since for \$56,000!! What, we would ask, has produced this immense increase in the value of property in this city? Is it not the increase of business? And what, pray, has tended to increase the business to such an enormous extent? Is it not the increased facilities for its transaction, the improved state of our country, and its fertility of soil? Admit this, (and who will dispute it!) have we not as wide a field for enterprise, and twice the enterprise and energy—arising from experience? What then, we ask, will be the value of real estate in this city a quarter of a century hence, should these two great works of internal improvement receive the favorable action of the present Legislature, and be completed at an early period? It would be increased to three times its present value. Who then, we ask, are more interested in their success, than the owners of real estate in the city of New-York? Let them come forward, then, and show that they appreciate their highly favorable position, and are willing to labor in the cause.

RAILROAD CONVENTION.—Proceedings of a Convention of Delegates from the southern tier of counties of the state of New-York, friendly to the construction of a railway from the city of New-York to Lake Erie, held at the Court-House in Bath, in the county of Steuben, December 17th, 1834.

The convention having duly assembled, was called to order by Mr. Dickinson, of the county of Steuben, whereupon Henry M'Cormick, Esq., of Tioga, was appointed Chairman, and Anson Gibbs, Esq., of Cattaraugus, Secretary pro tempore.

The roll being called, it appeared that the following named gentlemen were in attendance as delegates, viz.:

Walter Smith, Alphens Hawley, Walter Chatter, Israel Day, Anson Gibbs, James Stratton, Samuel Harvey, Timothy Daniel Heartwell, Ira B. John G. Collins, Alexander, Richard Charles, R. Church, W. R. Smith, W. Ward, John Arnot, Steph M. M'Cormack, Sam. Par Francis Smith, Wm. W. Rogers, Wm. Kerman, Henry Clark, Wm. Woods, David Masten, Wm. Goff, Ira Gansevoort, John E. Eves S. Williams, John Magee, Henry Switzer, James Manderson, George M'Clure, Wm. J. Neely, Wm. D. Knox, Chas. Hoffman, James Baldwin, Daniel Groten, David Edwards, Stephen Townsley, Anson Cook, Wm. Card, Isaac Santee, Andrew B. Dickinson, Wm. Stephens, James M'Burney, John W. Whiting, Paul C. Cook, Aaron W. Beach, Seth Wheeler, Johnson N. Reynolds, Burgess Rice, Wm. Baker, Peter Disbrow, John Dow, Wm. H. Lybolt, Matthew M'Dowell, Andrew G. Chatfield, and Theodore Titus.

On motion,

Resolved, That a committee of five be ap-

gress of the work, that the Directors, the Engineer, and the contractors are all confident that the whole line will be completed and ready for the public accommodation by the 15th day of June next.

The Company have contracted for two locomotive engines, to be manufactured in Philadelphia, on a new and, it is believed, much improved model—a model or plan, deemed by the Engineer, who has examined it, superior to any now in use in this country or any other. Eighteen passenger cars and twenty cars for freight and baggage, are also under contract in this city.

Upon Green island, which, by the bridge, is connected with the city, a site has been selected and laid out for a large business place. It is called "North Troy," and a map of it may be seen in many public places, in Troy Albany and New York. We cannot see why in may not populate most rapidly and in a short time become a flourishing ward or village.

The capital of Rensselaer and Saratoga railroad Company is \$300,000, and this sum, it is believed, will be nearly sufficient to complete the 241-2 miles of the railroad, erect a bridge across the Hudson, and three bridges across as many spouts of the Mohawk. Where has a railroad been constructed at so small an expense? The Mohawk and Hudson Railroad, about fourteen miles long has cost nearly \$900,000.

**VICKSBURG RAILROAD.**—We have been informed that about four hundred thousand dollars have been subscribed in the town of Vicksburg, to the railroad bank. A gentleman just from Clinton informs us, that *two hundred thousand* have been subscribed at that place, and we feel pretty confident that more than one hundred thousand dollars will be subscribed in this. Before the bank can go into operation, the charter requires that five hundred thousand dollars must be subscribed, and one hundred thousand paid in, so there is a very fair prospect of the bank's beginning operations in a very short period, and of the railroad from Vicksburg by Clinton, to the seat of government, being at least commenced.

Our neighbors of Natchez also are beginning to see the importance to them of a railroad to the interior of the state. They have a port of entry, and require some mode of conveyance for cotton to their wharves. Delegates have been appointed from our town to a railroad convention soon to convene in Copiah county, for the purpose of considering the propriety of constructing a road from Natchez to the interior, and we have but little doubt the work will be accomplished. We are pleased to see such a spirit abroad in the land.—[Jackson Mississippian.]

**THE RAILROAD FINISHED.**—It affords us pleasure to be able to announce to the public the completion of the Tusculumbia, Courtland, and Decatur railroad.

On Monday last, the cars passed through the whole line to Decatur, 45 miles, and have since been actively engaged, both day and night, in the heavy transportation of cotton, merchandize, &c. The unusual activity which has been thus imparted to trade and business of every kind, through the whole line of the road, embracing one of the most fertile and beautiful sections of the state, cannot but be highly gratifying to those who, by their public spirit and untiring exertions, have secured to North Alabama commercial facilities of such incalculable value. Our farmers now have the means of availing themselves of the highest prices for their cotton; the great barriers to a direct market are effectually removed.

Thirty odd cars are now in operation on the road, but we understand the number is quite inadequate to the amount of business required immediately to be done. Other

cars are being prepared at the railroad foundry, and another locomotive has been received at New Orleans from Liverpool, which is daily expected at this place. In a few weeks, it is thought, the facilities for transportation will be so increased, as to enable the company to render prompt and efficient attention to all the business which may be required on the road.

Expecting at a proper time to be officially furnished with facts and estimates in regard to the cost, profits, &c., of the road, we shall forbear at this time any speculations of our own. It may not be amiss, however, to remark, that upwards of 25 miles of the work have been made during the last year, at an average expense of something less than \$4,500 per mile.—[North Alabamian.]

**M'ADAM ROADS.**—The following extract from a letter written by J. LOUDON M'ADAM, Esq., who has probably done more than any other man living towards improving the "ways" of his country, will, we hope, be read attentively, and practised upon successfully, by Americans.

To the Editors of the Journal of Commerce

Gentlemen,—Happening to mention, in a letter to my friend and connexion, Mr. Loudon M'Adam, that I was about to construct a road for an approach to a country house, and that a hint from him might be of use, he has very good-naturedly sent me a reply which may be deemed the result of his great experience on the subject of road-making. There is so little apparent resemblance between the roads that are termed M'Adamized here, and those of England, that I am induced to send you an extract from his letter, in the hope that it may be of use to the public. A SUBSCRIBER.

"A road should not be sunk below the adjacent ground, as is too common, but rather elevated above it, if possible.

"The ground upon which the artificial road is to be placed, called by us the *bed* of the road, must be made quite dry, and must be kept always dry.

"There are two sources of wet which are to be avoided—under-water, which oozes from the adjacent soil, and which is the most mischievous and the most difficult to be dealt with, and rain water, or that which comes from above. The first must be kept out by side drains, that are several inches lower than the *bed* of the road. They may be open or covered, according to circumstances. A well constructed road will no more admit rain water than it will find its way through the roof of a house.

The road must be constructed by first shaping the *bed* into the form of a road, having a slope from the centre to the sides of not more than an inch in a yard. This bed is to be covered with three coats of broken stones; each coat is to be three inches thick, making nine inches in all, which will settle to seven inches. This covering, laid upon a *clay bed*, will carry any weight that could be brought upon a road. Each of the two first layers of stone must lie to be compressed by the *traffic*, or if there be no *traffic*, by a roller, until it gets to be nearly solid, and yet not so solid as to prevent its incorporation with the succeeding coat or layer. This is a nice point; and practice alone can ensure its being well executed. In the absence of this practical skill, you must, of course, make use of your own judgment.

"After the road is made, it must be closely attended to, until it is quite smooth and solid, by a man, or men, whose business shall be to rake the stones after every

wheel-track, in such a way as completely to erase every sign of a rut. But as yours is to be a private road, I recommend the use of the roller, both to settle and smooth the lower coats, so as to be ready to receive the upper, and to compress the upper until the passage of a wheel shall make no impression.

"The stones should be broken so that no piece shall exceed *three ounces* in weight, and to leave as many and as sharp angles as possible. These angles are the means of rendering a road solid. Use no gravel of any size or description *unbroken*. Smooth stones of any size will not become fixed, and your road will loosen. I have not allowed any stone above three ounces in weight to be put on the Bath or Bristol roads\* for the last three years, and we have found the benefit of the plan in the smoothness and durability of our work, as well as in economy. Do not allow any one to persuade you to *try coats of stones of different sizes*, as is often done. Larger below and smaller above is plausible and fanciful, but it never succeeds. The stones change places, the larger getting uppermost, and by moving these, they keep the road loose, and admit the water, &c. &c."

We learn from the Charleston Mercury that a young man in the employment of Messrs. Sykes & Sons, Sheffield, England, has made a steam engine which weighs seven ounces. It is so perfect, that with a spirit lamp and two table spoonfuls of water, it will go at the rate of a thousand strokes a minute, and will continue to work until almost the last drop is expended.

### Surprising Swiftmess.

M. Delisle has observed that a fly, so small as almost to be invisible, ran over a paper of almost 3 inches in half a second. It was so small that its feet might be reckoned to apply themselves successively upon the whole space that it ran over. And as it appeared to M. Delisle that they might be one-fourth of a line in bigness, it made in the space of a line 15 steps, or 15 motions, and, consequently, it made 540 in the space of 3 inches. How nimble must it be to remove one foot above 500 times in half a second, or more than 1,000 times in one of the common pulsations of our arteries!

### Proposed Suspension Bridge between New-York and Brooklyn.

To the Editor of the Railroad Journal, &c.

SIR,—Having occasion to cross the East river every day, between New-York and the neighboring city of Brooklyn, I have been forcibly struck with the many inconveniences attending the present mode of communication between those cities, and have been led to consider whether some less objectionable plan could not be devised. The system of ferriage is extremely well adapted for establishing communications between places separated by a river, when the breadth of that river is so great as to render it impossible to construct a bridge over it, or when the intercourse between those places is so small as to render the construction of a bridge an unprofitable spe-

\* Mr. M'Adam commenced his experiments as an amateur, on these roads, and he still retains the superintendence of them.

culatation; but in all places where neither of these objections obtain, it ought to give way to the more perfect mode of communication afforded by permanent bridges. My object, therefore, in now addressing you, is to show, through the medium of your valuable Journal, that the construction of a permanent bridge over the East river, between New-York and Brooklyn, is not only practicable, but would be a profitable speculation for any company to be engaged in.

It is evident, that in preparing a design for a bridge in this particular situation, we must keep in view the necessity of interfering as little as possible with the navigation of the river. No bridges are so well adapted to fulfil this condition as those on the suspension principle. For large spans, they are also less expensive. I would therefore propose the erection of a *Suspension Bridge*, as shown in the accompanying sketch.

From the maps of New-York, I find the breadth of the East river, opposite Fulton street, Brooklyn, is about 2000 feet. This I would divide into five openings—the central one of 500 feet, and the others of 315 feet each; these, with the thicknesses of the piers, will make up the whole breadth of the river. According to a chart in "Blunt's Coast Pilot," the central depth of water is  $5\frac{1}{2}$  fathoms, or 33 feet. The height, from the under side of the road-way to the level of high water, I have taken at 70 feet: this would, I believe, be a sufficient height to allow nearly all vessels to pass under without lowering their masts, but, if not, it may be increased to the necessary height, without any other difficulty than that of increasing the expense and the ascent of the road-way, both of which it is advisable to keep down as much as is consistent with the free navigation of the river. At the proposed height of seventy feet, the uniform ascent of the road, supposing it to commence on each side at 10 feet above high water level, would be but 1 in  $16\frac{1}{2}$ , which is much less than the rise given to many bridges. The breadth of the platform of the road-way I would make 34 feet, giving 12 feet on each side for a carriage way, and 10 feet in the centre for foot passengers.

In order to prove the practicability of the construction, a reference to what has already been performed in this branch of engineering will suffice. The first difficulty to be contended with is one that an engineer of ordinary practical skill will easily surmount—I refer to the laying the foundations for the suspension towers. These must be done in coffer dams, and will necessarily be attended with considerable expense. On reference to the published accounts of the bridge over the Schuylkill at Philadelphia, it appears that one of the piers of that bridge is founded in a depth of water of 41 feet 9 inches: this, according to the data we have been able to obtain, exceeds the depth of the East river by several feet.

The distance between the centres of the suspension pyramids of the bridge

erected by the late Mr. Telford, in Wales, over the Menai Straits, at Ynys-y-moch, is 579 feet  $10\frac{1}{2}$  inches. The distance from centre to centre of the suspension towers, in the central opening of our design, we propose to be 545 feet, purposely keeping it a few feet under that of the Menai bridge, in order to prove the practicability of its construction by a reference to works already executed: it being evident, that if a suspension bridge of 580 feet span has been erected, others of less openings can also be constructed.

It was my intention, on commencing this article, to have entered more fully into the details of construction, and to have made an estimate of the expense of the bridge; but, on further consideration, I will defer this part of the subject to a future number, (if you consider the matter of sufficient importance to occupy your pages,) as perhaps some of your readers may be in possession of the correct soundings of the East river in the situation referred to; if so, and they will be good enough to favor me with them, the estimate will be made with more correctness.

It will be seen by the sketch, that I have supposed the bridge to take its rise immediately from each shore, but it is evident that a more magnificent design might be formed were we to commence the rise 1000 feet back from each shore, by the formation of a solid road-way to the water's edge; the ascent would then be but half as great, and less obstruction would also be given to the shipping, as

then the greater number of vessels might pass through the side openings without lowering their masts, whereas, in the present design, all the taller ships must pass through the central opening. This would be decidedly the best plan, and would be attended with, comparatively, little additional expense, as the span under the road-way might be appropriated for stores; but as it would require the streets at each end to be very wide, I have thought it better to give a design which is independent of this circumstance.

The rapidly increasing intercourse between New-York and Long Island will, probably, soon require the formation of a wide street leading from Broadway. What a beautiful connection would such a bridge, as is here described, form between this supposed new street and Fulton street, Brooklyn! It would altogether be one of the most magnificent suspension bridges in the world.

A design of a still more magnificent character might also be formed by extending the central opening to 1000 feet. A bridge of this span has been declared practicable by the late Mr. Telford, and some of the most scientific men in England.

I am, sir, yours, respectfully,

W. LAKE,  
Civil Engineer and Architect,  
23 Nassau street.

December 9, 1834.

P. S.—A drawing on a larger scale than the accompanying sketch may be seen at my office.

[From the London Mechanics' Magazine.]

*Improved Carriage-Stopper for Inclined Planes.*

SIR,—I am perfectly convinced of the propriety of Mr. Deakin's remarks, the value of which has induced me to forward the accompanying sketch of a stopper, to prevent the descent of carriages upon inclined planes; one of the advantages of which will be, that several of them may be introduced, if required, in the same train, thereby dividing the load, or preventing danger, if any of the coupling chains should break. The falling catch (the action of which may readily

be perceived) has a spring to press it upon the wheel, and secure a correct movement. The rod behind is for the purpose of raising the catch, if not in use, as upon the levels, which may be changed by a very simple contrivance, and save the necessity of doing it by hand. The teeth of the rails would be preferable, and are designed for the inside, but are here shown for convenience of delineation. Trusting I have not trespassed upon your limits and patience, I remain, sir, your obliged servant,

JAMES WOODHOUSE.

Kilburn, Oct. 31, 1834.

*Semi-Annual Report of the Direction of the South-Carolina Canal and Railroad Company, to the Stockholders, October 31st, 1834, with Accompanying Documents.*

The following Report gives a favorable account of the condition and prospects of this important line of road. We are pleased to learn that they are now constructing embankments with all proper dispatch, wherever the road is built upon piles.

#### REPORT OF THE DIRECTORS.

*To the Stockholders, &c.*

The Directors of the South-Carolina Canal and Railroad Company herewith present to the Stockholders, a Balance Sheet of the Books of the Company, made up to the 31st of October, 1834, by J. T. Robertson, Secretary.

An Inventory of the property of the Company, in Lands, Buildings and Negroes, (together with the number, condition and value of the Locomotives, Tenders, and Tanks, Passenger, Burthen and other Cars, Wheels, Axles, Springs, Old Materials, and all other property appertaining to the Workshops at Charleston and Aiken, as reported by Mr. E. K. Dodd, Master of the Workshops,) amounting to \$227,342.76.

A statement, showing in detail, the business done on the Road for the last six months of the year, ending 31st October, by which will be seen the number of Passengers conveyed, the amount of freight and passage money, and the number of Bales of Cotton in each month, by H. Ravenel, Auditor.

And a Report upon the condition of the Road, and the general arrangements for Transportation, by H. Allen, Chief Engineer and Superintendent of Transportation.

By the General Balance Sheet, the total expenditure upon the Road, for Surveys, Buildings, Labor, Material, Machinery, Salaries, and Negroes bought, up to 31st Oct., 1834, is shown to have been \$1,336,615.00

The Receipts from	
Stock subscribed, \$900,000	
And from business	
done, &c.	180,907.51
	<hr/> 1,080,907.51

Leaving the Company in debt, \$275,707.56	
To which is to be added, for one	
month's Salaries and Negro	
hire up to 31st Oct.,	9,074.20
	<hr/>

Making total debt on 31st Oct.,	
1834,	\$284,781.76

And, by the Report upon the condition of the Road, and the general arrangements for Transportation, we learn from the progress of the work of Embankment, that there are now 65 miles of Surface Road, of which 27 miles are filled up level to the Rails; and that such arrangements are made in the Transportation Department as promise general satisfaction.

The work being near completion (one Cotton Depository and several buildings being still wanted) and in profitable operation, the debt due by the Company should cause no anxiety, as a steadily increasing business authorizes the belief that it will now gradually decrease, without hindrance to reasonable periodical dividends. Notwithstanding an unusual combination of unfavorable circumstances during the past Summer, the interruption of our intercourse with New-York by Cholera, its appearance at Augusta, the existence of Yellow Fever here, and the want of Locomotive power, all operating directly and seriously against

us, our gross receipts from the 1st of May have been \$83,445.42; and we do not hesitate to express the opinion, that but for the circumstances above enumerated, they would have been \$10,000 more, on passage money alone. The recurrence of such visitations, we may never again witness, and measures being in progress to secure Locomotive Power, our hopes of higher Revenue, during the Summer, for the future, are reasonable, and we trust may be realized.

Since the meeting in May last, two improvements of value have been completed, to wit: A Stationary Engine, by which the labor and expense of our Workshops are greatly reduced, and a Depository, for the reception of up Freight; the arrangement of which facilitates loading, and enables us to forward Freight in the order, as to time, in which it is received. A Cotton Depository being under contract, will soon be erected, near that just described, when the buildings at Line Street will be appropriated exclusively to the construction, repairs, and protection of Engines, Cars, &c.

Agreeably with a recommendation, approved at the last general meeting, the 1,185 Shares, then held by the Company, have been sold, and the proceeds applied to the purposes of the Company. The two Locomotives then reported as looked for shortly, from Mr. E. Bury, of Liverpool, arrived on the 9th September, were immediately placed upon the Road, and we are happy to say, have performed with great profit to the Company and credit to the builder. Four others, ordered from England, on the 3d March last, are expected soon to arrive, when we shall have ample power for present purposes. In anticipation of a great increase of business, an order for six Engines was forwarded on the 4th inst. to Wm. C. Molyneux, Esq., of Liverpool, to be executed with despatch; and arrangements are in progress here, to convert the boilers, and such other parts as are at Charleston, into Engines, and, after much ing of opinion of considerable out of the matter be useless

and lost.

The Locomotives now in use are twelve in number, to wit:

The Edinfield, by R. Stephenson & Co. of Newcastle.

The Augusta, by E. Bury, of Liverpool.

The Georgia, do. do.

The Columbia, by Fenton & Co. of Leeds.

The E. L. Miller, by M. Baldwin, of Philadelphia.

The Horry, by contract with E. L. Miller, of New-York.

The Aiken, by contract with E. L. Miller, of New-York.

The Native, by Eason & Dotterer, of Charleston.

The Hamburg, by the West Point Association.

The Edisto, by the West Point Association.

The Phoenix, rebuilt from our own Workshop.

The Constitution, rebuilt from our own Workshop.

Proposals have been made to carry all the Mails that the Post-Office Department may find expedient or advantageous to send upon the line of Road, for the term of four years, from the first of January next, at the rate of \$15,000 per annum. The result of which cannot be known before the 5th.

Agreeably with the notice by the news-

papers, of a public sale of Town Lots at Aiken, the same took place on the appointed day, when 67 Lots were sold, of which no returns have yet been made.

It gives us pleasure to add, that a rapidly increasing trade, the establishment of new houses of entertainment, and the healthfulness of the location, promise soon to make this a place of considerable importance.

Of the accidents which have occurred on the Road, some notice may be expected. We therefore report, that they have originated chiefly in the breaking of Axles under the Tenders and Freight Cars, which experience has shown were too light for the burthen they were required to sustain. That immediately after the first accident to the Axle of the Freight Car, orders were given to increase the size of 100 sets just then contracted for, of which about 40 sets have subsequently been received; and further to ensure safety, directions were given to lessen the weight of each Carload, to be ascertained and adjusted by passing over scales—which will soon form a part of the Road at the Depository.

In conclusion, the Board feel authorized to congratulate the Stockholders on the favorable prospects of the enterprise. A work of such extent, requiring the highest order of mechanical experience and skill, can no where be perfected at once. Occasional failures, delays and losses, are to be expected. No Road in the world is exempt from them, and in proportion to the length of ours, and the numerous difficulties we have had to contend with, we believe that our success is at least equal to that of any other Road of the same class.

Respectfully submitted by the Board.

JOHN RAVENEL, President.

#### REPORT OF H. ALLEN.

*To the President, &c.*

GENTLEMEN: At the request of the President, the following information, as to the Road and Transportation Departments, is herein communicated, together with the statements of Mr. Dodd, Superintendent of Machinery, as to the Department under his charge.

I have the satisfaction of reporting, that the system of management adopted for the care and gradual improvement of the Road, continues to effect those important objects in an efficient manner. The details of that system having already been fully communicated, a repetition is therefore unnecessary. Within the last six months, we have been able to carry more effectually into operation the views of the Board, as to the filling up of the Road and the gradual introduction of embankments. A portion of the work of this character has been carried on in cases where the earth could be conveniently obtained at the sides, and the filling in be effected without the use of Embankment Cars, by small contracts with individuals, residing on or near the line of Road. It is found that for all such cases, this is decidedly the most judicious plan, and it is intended to provide for all similar work in the same way. For the removal of work by Embankment Cars, when such are necessary, it is necessary that the force be employed by the Company under competent overseers. In many cases it is expedient to employ horse power for transporting the Cars, and it is believed that it can be done with facility, economy, and with such yearly progress as the Board may decide on.

There are now 65 miles of Road "Surface Construction," of which 27 miles are filled up level with the Rails.

A careful examination of the piles and other wood work has been directed and made within the last two months; which has resulted in the satisfactory reports, that apparently almost the entire Road exhibits few signs of decay, and that the few exceptions are where the timber was originally inferior, or where the Road runs within the first six miles through the dry sand ridges. To all such cases close attention is paid, and in filling up the Road, a particular attention is had to the relative state of the various parts. It is especially satisfactory to know that where the Road is elevated, in consequence of its passing over low grounds, the piles remain unimpaired, and possess to all appearances the same strength and security that have so long stood the test of long trains of Cars and Engines, heavier than it was originally intended to use.

It is also a highly gratifying fact, that of the accidents that have occurred on the Road, not one, to this day, can be attributed to a failure or defect in the Road. It may not be uninteresting to have stated what have been the sources of those accidents that have occurred.

They have been found in three causes. 1st, From the improper position in which the gates and crossing rails of the turnouts were in, when the Engines or Cars have attempted to enter or leave the passing places. Such are therefore attributed to the neglect or mismanagement of the attendants at the turnouts. Our efforts and arrangements to remove this source of accidents, have been nearly successful, and it is believed they will be hereafter of rare occurrence.

Another source of accident has been in the running one Engine against another, and, in some instances, against animals that cross the road before the Engine.

It is however principally from the breakage of Axles that most of the accidents have originated. It is probable that the use of high Cars and elevated loads of Cotton have occasioned the breaking of the same sized axles that have previously, with the low cars, been found adequately strong. Measures were taken some time since to guard against such breakage, by reducing the loads carried by the present cars, and having all the new axles made of larger dimensions.

The breakage of axles on our Road has proved a source of greater inconvenience than was expected, in consequence of the structure of the Road being such as to permit the broken parts of wheels or axles, when they dropped, to become entangled with them, by which means, as the Engine continued to advance, much of the Road may be deranged, and thus the evil be extended to other Cars. It is in reference to this attendant evil (and it is one which frequently may be greater than the original one,) that it becomes of peculiar value that the extent of surface be increased as much as possible, and it is a consideration of great weight, not only that the Embankment operations be carried on at an earlier day and with greater progress than was originally intended, but that all parts of the Road, which can be easily filled up, should be rendered secure in this respect as soon as possible.

The use of Engines occasioning a greater weight in one point than was originally calculated upon, has in some instances gradually pressed the iron plates into the wood; and where the timber has been inferior, rendered a new surface necessary. This is readily done, and is attended to by the overseers and their assistants.

In the Transportation Department, much

improvement has been effected in reference to the security of goods from fire and wet, and as our steam power and cars are becoming more adequate to the demands for transportation, greater regularity and certainty is gradually introduced. Manifest advantages as well as economy have been experienced from the new arrangements for the receipt, loading and forwarding goods at the new Depository in Mary street. By means of them, goods are loaded in the order in which they are received, the cars are put in train and dispatched in the order in which they are loaded, and the same order of Cars preserved throughout the line. Thus goods will be delivered at the place of destination in the consecutive order in which they were received. Similar arrangements will be eventually necessary at the more important Depositories. Those for Hamburg, the contracts for the construction of which were entered into some time since, it is expected will soon be in operation, and it is believed generally to the benefit of the Company, and to the dispatch

having in  
as in the  
partment  
is to that  
cars to be  
Railroad  
mitted.  
ALLEN.

October 31st, 1884.

Statement of the number of passengers conveyed on the Railroad, the number of bales of cotton brought down on it, with the amount received from freight and passage for the six months ending October 31st, 1884.

Excess of Receipts over current expenses from 1st May to 31st October, 1884.....	25,941 75
Receipts of Road from 1st May to 31st October, 1884.....	\$83,446 42

DELAYS IN CHANCERY.—We frequently read in American papers sneers upon the interminable doubts and delays in the English Court of Chancery, which would seem to imply that in that particular we are better off. The fact is, however, with respect to this State, that a case in Chancery, heard upon pleadings and proofs, cannot be brought to conclusion in less than TEN YEARS! We question whether my Lord Eldon doubted upon an average longer than this.

[From the Herkimer County Whig.]

THE RAILROAD.—On Tuesday last, the appraisers appointed to ascertain the value of the lands at this place, which the Utica and Schenectady

as much as the railroad will obstruct them. Now we believe that the said property so offered for sale, would command a price at least double that put upon it by the appraisers; not perhaps for the actual use of the purchaser, but for the purpose of re-sale to Mr. Ward. And we are well assured that after this matter is entirely settled, Mr. Ward, or any other person situated as he is, would gladly pay to the Railroad Company, ten thousand dollars for this very strip of land.

We are informed Mr. Ward intends to carry the case before the Chancellor for correction.

In the above notice we by no means intend to call in question the impartiality or the motives of the appraisers. The character of these men would repel any unfavorable imputation. But with proper respect to their opinions we merely offer our own, from doing which an editor cannot well refrain.

The following article is from the Westchester Spy.

POUGHKEEPSIE.—We like Poughkeepsie—perhaps because it has been our home, the scene of our boyish sports, the place where we were caressed and flogged, scolded, flattered, and drubbed into obedience. But no matter about the cause—as we said, we like the place, and on passing through it a few days since we were struck with the changes which have taken place in and about the village. There is indeed a spirit of enterprise and improvement awake which is making it one of the most beautiful and desirable locations within the circle of our acquaintance. Within a few years a great number of new and elegant buildings have been erected, the streets have been handsomely paved, the number of stores have greatly increased, and it has put on an active, stirring, business-going aspect, which is a sure indication of its prosperity. And if, as a western editor has remarked, "the business, character, enterprise, and advantages of a place may very accurately be estimated from its newspapers," Poughkeepsie will rank high on the list of flourishing villages, and present an improvement unparalleled in the oldest settled countries. It seems to us but a short time (we cannot say exactly how long) since the Poughkeepsie Journal and the Dutchess Observer, two small, blue, meagre-looking papers, were all that were issued in the village. Now there are four large and costly printed sheets, some of which, for the beauty of their appearance and the able manner

in which they are conducted, are scarcely surpassed by the best journals in the State.

With a large extent of rich, fertile, highly cultivated land to support it, Poughkeepsie must continue to increase its business; and should the inhabitants succeed in constructing a canal or railroad to Stockbridge, as they contemplate, it will open new sources of wealth and activity and give a new impetus to the growth of the place. Two whaling companies with a capital of \$300,000 each, have been chartered, the stock of which has all been taken up, and one of them is in successful operation with three ships at sea. A reservoir to supply the village with water in case of fire is also in progress, and measures are taken to procure a charter of a third bank, which it is thought will be obtained without much opposition.

The improvements on the north side of the village are particularly worthy of notice. Messrs. Oakly and Cunningham, who jointly owned the land, have laid out a new and beautiful street, and whilst we were in the neighborhood sold 36 lots at auction at an average price of \$300 each, besides several others at private sale. On these lots the purchasers design to build, and it is thought that this will ere long be the pleasantest part of the village. Besides, we perceive that the supervisors have taken measures for the erection of a new and elegant Court House, and an application will probably be made to the Legislature this winter to that effect.

[From the London Mechanics' Magazine.]  
*Steam-Carriage in Belgium.*

ANTWERP, Sept. 28.—This day a trial was made with one of the locomotive machines which have just arrived in this country from England. It was perfectly successful. The carriage started at half past eleven, along the paved road from Antwerp to Brussels, and proceeded as far as Luytgen, where the company stopped for twenty-five minutes. At a quarter to one, the carriage had returned to Antwerp, and was running round the Place de Meir. Notwithstanding this speed, we observed that, on account of its being the first trial on our roads, the carriage was not allowed to go with any thing like the velocity of which it is capable, and we are assured that in future it will be allowed to run even much faster! All along the road the spectators, astonished at a sight so new to them, saluted the steamer with cheers and acclamations. This new carriage does not only run with extraordinary velocity, but it stops and turns and winds about in every direction with astonishing facility. This was particularly remarked during the evolutions on the Place de Meir, amidst crowds of carriages, horsemen, and pedestrians. Many persons had previously thought that the steam-carriage would be the cause of accidents by causing alarm to horses. This objection is proved to be chimerical; it was purposely put to the test in every possible manner. Horses were made to approach it in various ways, and not one, at any time, showed any symptom of fear. Both going from and returning to Antwerp the steam-carriage drew another carriage after it, full of passengers. *Mor. Herald.*—We believe the carriage here alluded to is that of Messrs. Squire and Macerone.

*Anecdote.*—An honest Hibernian, upon reading his physician's bill, replied to the Doctor that he had no objection to paying him for his medicine, but his visits he would return.

Fig. 1.

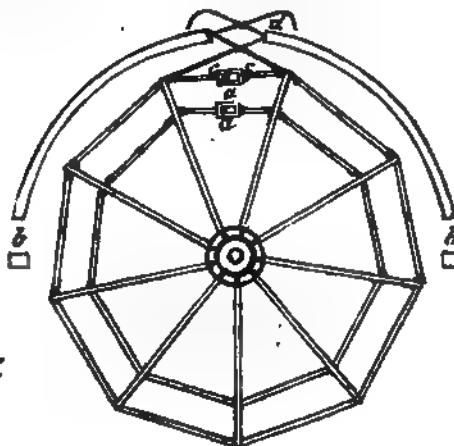

Fig. 2.

[From the London Mechanics' Magazine.]

#### *Shifting Paddle Wheel.*

SIR,—I send you the accompanying plan and description of a paddle wheel for insertion in your Magazine. The intention of it is to facilitate the withdrawal, and to remove entirely the wheel from the vessel in a few minutes. It has generally been admired for its simplicity; but from my not having means to produce it on a large scale, I take this opportunity of laying it before the public, imagining that in some cases it will be conducive to the general good.

The wheel is nearly similar to the ordinary one, with the exception of one segment of the boss being so constructed as to allow the radii arms there inserted to revolve on circular bolts, as may be seen in the upper part of fig. 1; and those revolving radii are connected by disjoined rims, which are of course flexible. The two upper radii may be separated by unscrewing the two shackle screws *a a*, which are for the purpose of bringing the moveable segment of the wheel tightly together.

Now, as the wheel is represented in fig. 1, it is connected and ready for use; and to remove it from the water, the screws *a a* are eased down, and the weight of the divided segments is allowed to come upon the tackles *c c*, which are attached to the two upper radii, and the top of the paddle box, through the two scuttles *d d*. They are then lowered down upon the standing part of the wheel, and lashed thereto with chains through the scuttles *b b*. The paddle is then caused to make a demi-

revolution, and is entirely withdrawn from the water, assuming the position of fig. 2.

I will now enumerate the advantages which I think would be derived from my invention.

First, should a vessel be running along a lee-shore, and an accident happen to her machinery, which renders it useless, the paddles could *entirely* be taken off the vessel in a few minutes, and she would be placed under canvass to keep her off the shore.

Secondly, should a steam-vessel be on a long voyage when the fuel must be economised, it would be easy to take advantage of every favorable breeze; or in running down a trade wind, to consume no fuel for days together.

And, thirdly, it would be of great benefit to remove the paddles in case of exposure to ice, as in the Dutch or Russian steam-vessels, which have to encounter the destructive effects of the broken ice when the thaw commences. Or should a steam-vessel be again wanted for another Polar expedition, what an advantage it would be to her to be capable of immediately withdrawing her paddles, in case of being suddenly surrounded with ice, or again quickly applying them on meeting with clear water.

I have constructed a model with the flexible rims formed of crank chain, but which I have been advised to lay aside in favor of my original plan of jointed bars. Trusting it may be approved of,

HENRY CUNNINGHAM.

Cold Harbor, Gosport.

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, JANUARY 17, 1835.

✍ The Postmaster at Desmond, M. T., is particularly desired, after he has read the Railroad Journal, to put it again into an envelope, and forward it to the gentleman who has a right to open it.

✍ We again request those who desire missing numbers of the Journal to give us a list of them when they forward their subscription for the 4th volume.

✍ If "A Reader," or any other friend, will send us a copy of the letter giving an account of the progressing works of the Pacha of Egypt, or other works of internal improvement, we will publish them with pleasure.

To the Editor of the Railroad Journal.

SIR,

The comparison of the foreign and domestic tonnage of this port, with that of the Erie canal, furnished by the collectors of this port and Utica, published in your Journal, has led me to the inquiry of the trade beyond our own State, to and from Buffalo, for the years 1832 and 1833, where the singular fact is presented, that, out of the 967,565 barrels of flour which passed Utica in 1833, only 75,565 barrels came from beyond Buffalo, (not 8 per cent.,) being an increase of 800 per cent., in one year, over 1832. The collector's returns of this year for Buffalo is not yet received; but the increase of flour for 1834, passing Utica, is 189,246 barrels, a large part of which may with propriety be placed to the increased commerce with Ohio, owing to the completion of their canal—A TRADE, TOO, TRULY IN ITS INFANCY, as we find by statements furnished

by A. C. Flagg to C. F. Mercer, Esq., [see Congressional Document, No. 414, p. 225,] that nine-tenths of the bread stuffs, provisions, &c., transported on the Erie canal, are produced by our own state. We find, also, that the Governor, in his last message, observes that it is necessary to "enlarge" the Erie canal, as well as make double locks, and states his regret that a law to this effect did not pass at the last Session. In this opinion I cannot agree with him, as I think that on examination it will be discovered that an attempt to enlarge the Erie canal will be attended with more difficulties than at first meet the eye, with the certainty of destroying one or more years of business, to the ruin of thousands, and injury of this city, by directing the trade into other channels.

It is not ten years since the Erie canal has been completed, and in that short period it has produced its entire cost. In three years more, the comptroller will be in funds, for the cost of the Erie, Champlain and lateral canals. Under this view, and the evident incapacity of the Erie canal to supply the wants of our own State, an enlightened forecast should prompt us to at once commence an enlarged or steamboat canal, 90 feet wide, and 9 feet deep, around the falls of Niagara, from Oswego to the Hudson, to serve the wants of the growing "far West," as it must be clear to any observer, that, even with double locks and enlarging the Erie canal, it will only serve the purposes of our own State for some 10 or 15 years, unless relieved by the "Ship Canal" project, and railroad facilities from Utica.

So soon as the tolls are reduced, as is contemplated, the produce of the finest forests, in ship timber, lumber, &c., and the exchange of commodities throughout the canal, will produce a trade that cannot be imagined, when, ere 15 years, we shall have in this State a population of 4,000,000, now estimated at 2,500,000, of which above 250,000 souls reside in this city.

The table I have alluded to shows that only 28,683,708 lbs. of the 157,357,547 lbs. of merchandize, which passed Utica in 1833, was destined beyond Buffalo; whilst of furniture, farmers' and mechanics' tools, there passed by Utica 7,595,732 lbs., and beyond Buffalo 7,568,846 lbs., showing an increase of transport of 1833 over 1832 of 2,677,425 lbs.; and the year 1834 shows a further increase for that year of 3,077,070

lbs. over 1833, or 10,672,802 lbs. passing Utica: showing clearly the immense current of population setting to the "far West," from whom as yet we have received no returns, and whose wants from the sea-board are yet very limited.

The report of merchandize in 1833 from Buffalo was 13,351,729 lbs.; in 1833, 28,683,708 lbs., being an increase of more than 100 per cent., and there is no doubt it will progress in the same ratio for several years, particularly when such crowds of emigrants are passing to the West; and we find that the Territory of Michigan, by official accounts, has trebled her population in 4 years, and now claims admittance into the Union.

With such facts before the public, the merchants and property holders in this city are deeply interested in the contemplated project of an enlarged and separate canal, to connect the Hudson with the Upper Lake, and thence by the Illinois river to New-Orleans, by steam, and should at an early day give an expression of their sentiments to the Legislature, by a public meeting to adopt measures to promote the object.

J. F. B.

To the Editor of the Railroad Journal:

DEAR SIR,—A few days since I was invited by one of the managers of the West-Point Foundry to inspect a locomotive engine just completed at that establishment, designed for the Tusculum, Courtland and Decatur Railroad; and as its construction is somewhat different from others, perhaps a description of it will be interesting to your readers. It is raised on four 4½ feet wheels; the hubs are of cast iron, with wrought iron spokes and tires; the outside frame is entirely iron, securely bolted; the inside rails are of wrought iron—(hitherto, in all engines made in this country, they have been made of wood); all the working parts are of cast steel, and appear to have been finished with great care. The weight of the engine, with the boiler, is 6½ tons; it will carry 80 tons at the rate of 18 miles per hour on a level railroad. The appearance of the engine is by far the handsomest I have ever seen, either in this country, or in Europe; and the managers state that the West-Point Association will guarantee that any that they may hereafter build shall be equal to any made in the world.

I am, &c. Yours, &c.

New-York, January 15, 1835.

[From the Albany Argus.]

## ANNUAL REPORT OF THE COMMISSIONERS OF THE CANAL FUND.

The annual report of the Commissioners of the Canal Fund, was presented to the house of Assembly yesterday. It is an able and interesting document. We give the following extract:

*Erie and Champlain Canal Fund.*

The actual amount of revenue received on account of the Erie and Champlain Canal Fund, from all sources, from the 30th September, 1833, to the 30th September 1834; is as follows, viz:

From tolls,	\$1,313,155 84
Vendue duty,	169,337 04
Salt duty,	160,782 98
Interest upon deposits of surplus moneys,	117,092 00
Interest upon loan to Albany, and upon investments in stocks,	4,082 64
Rents of surplus waters,	5,438 50
Sales of lands, Anonymous,	2,441 03
Proceeds of sale of a canal boat,	15 37
	19 40
	<b>\$1,772,364 80</b>

The actual amount of expenditures during the year, has been as follows, viz:

For interest on canal debt,	\$278,173 26
Repairs of the canals, by superintendents,	423,517 10
Payments on account of canals, by Canal Commissioners,	15,006 17
Salaries of weigh masters, assistants, &c.,	4,511 25
Printing for canals,	9,646 68
Tolls refunded,	88 93
Costs of suits for penalties,	56 35
Balance of collectors' accounts,	299 40
Payment to proprietors of Albany basin,	3740 48
Payment to Samuel Young, Canal Commissioner,	509 64
Payment to canal appraisers,	18 00
Salary of 2d Deputy Comptroller, canal department,	1,650 00
Extra allowances,	3,135 32
Sundry miscellaneous payments,	3,247 29
	<b>736,699 88</b>

Thus showing the nett revenue of the Erie and Champlain Canal Fund, after paying all expenses, to amount to the sum of **\$1,035,664 92**

The surplus funds in the hands of the Commissioners, on the 30th September, 1833, as shown in the annual report of last year, amounted to the sum of **\$2,602,694 76**

The amount received by the Commissioners for the year ending 30th September, 1834, from all sources, is, **1,765,147 33**

Making a total sum to be accounted for by the Commissioners, of **\$4,367,842 09**

This sum is accounted for as follows, viz:

Paid for interest upon canal debt, **\$278,173 26**  
For purchase of canal stocks, viz:

5 per cents 1837, **\$157,732 88**  
do 1837, **269,986 87**  
do 1845, **211,110 31**  
**638,830 06**

To canal superintendents, **423,517 10**  
To Canal Commissioners, **15,006 17**  
To sundry expenditures, as detailed in statement A, **9,739 20**  
**1,365,265 79**

Leaving a balance in the hands of the Commissioners, on the 30th September, 1834, applicable to the canal debt, of **\$3,002,576 30**

Of this balance, there was in deposits and on loan in sundry banks, **\$2,823,823 35**  
Loaned and invested in stocks, **178,752 95**  
**\$3,002,576 30**

Thus accounting for the whole amount of the surplus funds under the care and management of the Commissioners.

*Canal Debt and Redemption of Stock.*

In the last Annual Report, the total amount of Erie & Champlain Canal stock, remaining unpaid on the 30th September, 1833, was stated at **\$5,522,659 29**

Redeemed during the year ending 30th September, 1834, **588,006 61**

Total amount of Erie & Champlain Canal stocks unpaid 30th September, 1834, **\$4,934,652 68**

From this amount deduct the means in the hands of the Commissioners at the close of the fiscal year, applicable to the payment of this debt, as before stated (omitting \$27,153 71 of bonds for lands,) **3,002,576 30**

And there will remain a balance of the Erie and Champlain Canal debt, as yet unprovided for, of **\$1,932,076 38**

It was stated by the Commissioners in the last Annual Report, that if the receipts for each of the next three years should equal these for the year embraced in that report, the funds accumulated would be sufficient to cancel the whole debt contracted for the construction of the Erie & Champlain Canals, nine years before the latest period fixed by the State for the redemption of the stock. This opinion is fully sustained by the receipts for the year ending 30th September, 1834; the sum applicable to the debt, after paying the current expenses of the year, being more than a million of dollars; and leaving a balance of debt to be provided for, of less than two millions. If the annual nett revenue from the canal fund for the two succeeding years, should equal that of the year ending on the 30th September last, the means would be provided for the final extinguishment of the Canal Debt on the 30th September, 1836.

The contemplated improvements, of doubling the locks from Albany to Syracuse, and rebuilding the aqueduct across the Genesee river at Rochester, authorized by the act, chap. 312, of the laws of 1834, will require the expenditure of from six hundred thousand to a million of dollars, and to this extent will diminish the estimated means for the payment of the canal debt within the next two years. But it is believed the proceeds of the canal revenues will furnish the means for these extraordinary disbursements, and also for the payment of the whole debt contracted for the construction of the Erie and Champlain canals, by the close of the fiscal year in 1837.

The Commissioners have continued to purchase canal stock with the surplus funds in their hands, and during the year ending on the 30th September, 1834, have obtained and cancelled stock issued for the construction of the Erie and Champlain canals to the amount of **\$588,006 61**. In 1833, as shown by the last annual report, the Commissioners purchased stock to the amount of **\$1,478,376 71**

Add purchases of 1834, **588,006 56**

And it is shown that within the last two years the Commissioners have redeemed and cancelled stock to the amount of **\$2,066,383 13**  
To obtain this stock there has been paid in premiums the sum of **138,756 91**

Total paid from surplus funds to redeem canal stock, within the last two years, **\$2,205,140 09**

When the stock was issued for the construction of the Erie and Champlain Canals, a part of it was made payable in 1837, and the residue in 1845. At the close of 1833, the surplus moneys in the hands of the Commissioners, which were pledged to the redemption of this debt, amounted to something more than three millions of dollars. This sum was principally loaned to various banks in the State at an average interest of 4 1/2 per cent. In this way, the surplus funds destined for the payment of the canal debt, necessarily became interwoven with the business operations of the State. The first instalment on the debt, being \$3,489,000 00, becomes payable on the first day of July, 1837. The withdrawal of this large sum from the business of our citizens on a particular day, it was apprehended by the commissioners, as stated in their former reports to the legislature, might prove a serious inconvenience to those who had accommodations from the Banks, as well as to the banks themselves. By the gradual purchase of the stock, the Commissioners effected the double object of lessening the deposits in the banks, and at the same time of diminishing the amount of the stock redeemable in 1837. Thus far their exertions have been as successful as could reasonably be anticipated. Of the debt of 1837, the sum of \$1,459,982 70 has been paid; leaving of the stock reimbursable in 1837 the sum of **\$2,029,007 30**; a sum which can be paid in a single year, without much inconvenience. The purchase of stock, however, will be continued, and the sum reimbursable in 1837 will probably be reduced one-half in the year 1835 and 1836. In this way the objects of the Commissioners will have been accomplished, and the debt of 1837 cancelled, without the slightest inconvenience to the business operations of the State.

*Management of the Canal Fund Moneys.*

The nett revenues of the Erie and Champlain Canal Fund amount to about one million of dollars annually; and there is now an accumulation of the surplus in the hands of the Commissioners, amounting to more than three millions of dollars. The management of these moneys was entrusted to the Commissioners of the Canal Fund by the original law passed in 1827, "respecting navigable communications between the great Western and Northern Lakes and the Atlantic Ocean."

[Here follows a detail of the arrangements made for loaning the surplus moneys from 1827 to 1834, at 3 1/2, 4 1/2 and 5 per cent.]

At the close of the fiscal year, the surplus moneys belonging to the Erie and Champlain Canal Fund were loaned and deposited at rates of interest varying from 3 1/2 to 5 per cent, in the following proportions, viz:

Terms of Deposit.	Amount on Loan of Deposits.	Annual interest.
On Loan at 5 per cent. payable at 60 days' Notice.	\$611,000 00	\$30,550 00
do 4 1/2 do	1,304,784 38	54,215 29
On Deposit at 4 1/2 per cent. payable at sight.	976,861 93	43,958 78
do 3 1/2 do	31,177 04	1,091 19
	<b>2,823,823 35</b>	<b>129,815 26</b>

The efforts of the Commissioners to make such arrangements as would enable them to command the money whenever it should be required, to pay for or purchase stock, and at the same time to realize an interest upon it, have been entirely successful. The Commissioners have drawn upon these deposits to the amount of between 7,

and \$200,000 annually, from 1826 to the present time, to pay the interest upon the debt and the repairs of the canals; they have drawn about two millions eight hundred thousand dollars for the purchase of canal stock; and at the same time there has been added to the canal fund more than four hundred and eight thousand dollars, from interest on the surplus monies loaned to and deposited in the Banks during the last nine years, viz:—

Received for interest on deposits,			
do	do	1826	\$4,515 04
do	do	1827	4,987 96
do	do	1828	7,281 20
do	do	1829	7,576 30
do	do	1830	24,000 17
do	do	1831	35,710 31
do	do	1832	84,619 15
do	do	1833	122,236 74
do	do	1834	117,092 00

\$408,018 87

The above sum of \$408,018 87, embraces only the amount of interest paid by the Banks. The fund has been increased by interest on other investments of the surplus, to the amount of \$101,835 65; making a total increase to the fund from interest on investments and deposits since 1826, of \$509,854 52. Add to this the fact, that during the same period, there has been collected for tolls, and auction and salt duties, between eleven and twelve millions of dollars, through the agency of the banks, and of the numerous collecting agents, without loss of a single dollar to the State; and the best evidence is furnished of which the case is susceptible, that the great interests of the State have not been neglected or disregarded by those who have been entrusted with the collection and management of the Canal revenues.

#### Reduction of Tolls.

The Canal Board, in January last, made a reduction in the rates of toll, on merchandize, of 25 per cent. and a reduction on wheat, flour, salted beef and pork, butter and cheese, of 12 per cent. and a considerable reduction on various other articles.

The following comparative statement of the sums charged on property transported, shows the extent of the diminution in the rates of toll, within the last two years, and the saving which these modifications secure to those who use the canals.

	1832.	1833.	1834.
Toll on 1000 lbs. merchan, from Albany to Buffalo.	\$5.08 2-10	\$4.35 6-10	3.26 70-100
Toll on 1000 lbs. flour and provisions from Buffalo to Albany.	2.54	1.81 5-10	1.62 35-100
Total.	\$7.62 2-10	\$6.17 1-10	4.89 5-100

The toll on an ordinary boat load of 30 tons of merchandize from Albany to Buffalo (363 miles) would amount, by the rates in 1832, to \$304 92 And by the rates in 1834, to 196 02

Gain to the owner of the property on a single load, \$108 90

The toll on 30 tons of wheat, flour, or provisions, from Buffalo to Albany, would amount, by the rates of toll in 1832, to \$152 46 And by the rates in 1834, to 97 41

Gain to the owner by the reduction in the rates of toll, \$55 95

It is thus seen, that on a comparison of the rates of toll as now established, with the rates, of 1832, the person who has a cargo of 30 tons of produce to carry from Buffalo to the Hudson River, and carries back a cargo of 30 tons of merchandize, makes a clear saving by the reduction in the rates of toll, of \$163 95.

It has been estimated that the reduction in the rates of toll in 1833, applied to the same amount of property which was transported on the canals in 1832, would produce a loss in the aggregate amount of revenue equal to \$150,000; and that

the reductions in 1834, applied to the property transported in 1833, would occasion a loss to the revenue of more than \$200,000.

The amount of tolls collected upon the Erie and Champlain canals, during the season of navigation for each of the last four seasons, has been as follows:

In 1831, at the old rates of toll,	\$1,194,610 49
1832 do do	1,195,804 23
Total in two seasons	\$2,390,414 72
In 1833, (average reduction of tolls about 20 per cent.)	\$1,422,695 22
In 1834, (further average reduction of 15 per cent) about:	1,800,000 00

Total in two seasons \$2,722,695 22  
This statement shows, that notwithstanding a reduction in the rates of toll which is equal to 35 7-8 per cent. within the last two years, such has been the great increase of business upon the canals, that the aggregate amount of tolls collected from the opening to the closing of navigation in the years 1833 and 1834, exceeds the collections for 1831 and 1832, by the sum of \$332,280 50.

We condense from the report the following view of the results in relation to the lateral canals:

Oswego Canal.	
Expenditures	\$33,889 84
Received for tolls	2,240 01
Paid from general fund to make up deficit,	12,649 83
Cayuga and Seneca Canal.	
Expenditures	20,866 17
Received for tolls,	17,104 41
Paid from general fund to make up deficit,	3,761 76
Chemung Canal.	
Expenditures	42,425 46
Received for tolls	1,704 90
Paid from general fund to make up deficit	\$40,723 85
Crooked Lake Canal.	
Expenditures	21,731 49
Received for tolls	1,007 60
	20,723 89

There was a balance of \$7,894 07 in the hands of the Commissioners at the close of the year 1833, and there has been drawn from the treasury for deficiencies in the revenues of this canal, the sum of \$13,829 82.

#### Suspension Bridges, No. I.

To the Editor of the Railroad Journal.

SIR,—It has occurred to me, since I sent you the drawing of the suspension bridge, for forming a connection between New-York and Brooklyn, that a short descriptive account of the principal suspension bridges now in existence would be interesting to many of your readers. Should you concur with me in this opinion, I will, at my leisure, furnish you with a series of papers on the subject, commencing with the following.

We are informed by travellers, that suspension bridges, formed of chains of iron, are now to be seen in China and the East Indies of great antiquity; but as these are of such a description as to furnish no practical information relative to the mode of constructing modern suspension bridges, we shall not trouble your readers with any account of them here.

With the exception of the Winch bridge, constructed about the year 1741, it does not appear that any bridges on the suspension principle were to be found in Europe till the 18th century. This bridge is described in Hutchinson's antiquities of

Durham, printed at Carlisle in 1794, in the following words:

"About two miles above Middleton, where the river falls in repeated cascades, a bridge, *suspended on iron chains*, is stretched from rock to rock, over a chasm near 60 feet deep, for the passage of travellers, but particularly of miners. The bridge is 70 feet in length, and little more than 2 feet broad, with a hand rail on one side, and planked in such a manner that the traveller experiences all the tremulous motion of the chain, and sees himself suspended over a roaring gulf on an agitated and restless gangway."

The first suspension bridge in this country was built by Mr. Finley, of Pennsylvania, in 1796, across Jacob's creek, between Union Town and Greenburgh. The length of the bridge was 70 feet. Mr. Pope, in his treatise on bridge architecture, describes several others as having been erected by this gentleman. The largest across the Schuylkill is 306 feet long. It is borne by two chains, one on each side, the iron of which is 1½ inch square. Another across the Brandywine at Wilmington is 145 feet long, 30 feet wide, and is borne by four chains, the iron of which is 1½ inch diameter. In the same work we have also an account of a chain suspension bridge of considerable strength erected over the Merrimack, near Newburyport, Massachusetts, by John Templeman, Esq. The span of this bridge is 244 feet. The pieces upon which the timber framed work for suspending the chains is erected are of stone, 47 feet long and 37 feet high. The timber suspension frames are 35 feet high. The bridge is formed of 10 chains, the ends of which are carried down into deep wells in each bank, and are therein fixed to heavy stones; each chain is 516 feet long; and at the top of the suspension frames the chains are tripled and made with short links. The four middle joists rest on the chains, the rest are suspended from the chains by rods to keep the road horizontal. There are two roadways, 15 feet in width each, and the floor is said to be so solid as to admit of horses, carriages, &c. to travel at any speed without occasioning any considerable vibration. The chains are arranged three on each side and four in the middle. The height from the water to the floor of the road-way is 40 feet. It is stated that the whole expense did not amount to 25,000 dollars.

In Mons. Cordier's Historie de la Navigation Interieure, published in 1820, it is stated that 40 bridges on Mr. Finley's plan had been erected, at that time, in this country. He mentions one, built in 1815, on the Lehigh, a mile below Northampton, it consists of two openings and two semi-arches; its whole length is 475 feet. The chains are placed so as to divide the platform into four ways, two for carriages in the middle, and a foot path on each side. The chains were made with iron bars 1½ inch square. The cost, 20,000 dollars.

The attention of British engineers appears to have been first directed to the

subject of suspension bridges in the year 1814, when it was proposed to substitute a bridge over the river Mersey in lieu of the ferry at Runcorn-gap, about twenty miles below Liverpool. From the nature of the navigation it was necessary that the bridge should consist of not more than three openings, the centre one of 1000 feet and two others of 500 feet each, and that its height above the surface of the water should not be less than 60 feet. The celebrated engineer, the late Mr. Telford, having been applied to on the subject, proposed the erection of a suspension bridge. It was to consist of 16 iron cables, each formed of 36 square half inch iron bars; and of the segments of cylinders proper for forming them into one immense cable, which, including the fixings on shore, was to be nearly half a mile long, and about  $4\frac{1}{2}$  inches diameter. When this bridge was proposed there existed very little experience in the construction of suspension bridges, and in order to obtain proper data for proportioning the strength of the various parts, Mr. Telford instituted a very valuable course of experiments, some account of which I shall probably give in a future number. This bridge has not yet been erected, but as it served to call the attention of scientific men to the subject, and may thus be considered as the origin of the great extension that has since been given to this mode of bridge building in Europe, I thought this account of it here would not be out of place. W. L.

Dec. 15th, 1834.

P. S.—In making out the design of the suspension bridge over the East river, I have supposed the piers for the suspension towers, &c. to be constructed of masonry: this would evidently be the most durable mode of construction, but I could furnish a design for a very substantial bridge, the piers and suspension towers of which should be wholly constructed of timber. The expense would thus be very greatly reduced, as we could then dispense with the use of coffer-dams for the foundations of the piers. The cost of such a bridge would not, probably, much exceed the receipts of the Fulton Ferry company for one year.

(To be continued.)

[From the Repertory of Patent Inventions.]

*Report on the Progress and Present State of our Knowledge of Hydraulics as a Branch of Engineering.* By GEORGE RENNIE, Esq., F. R. S., &c. &c. Part I.

The Report of which the following is a part, has appeared in the recently published "Report of the Third Meeting of the British Association for the Advancement of Science," held at Cambridge in 1833." We purpose to present our readers with the whole of Mr. Rennie's review of the history of hydraulics, as applied to engineering, in successive extracts.

The paper now communicated to the British Association for the Advancement of Science, comprises a Report on the progress and present state of our knowledge of hydraulics as a branch of engineering, with reference to the principles already established on that subject.

Technically speaking, the term hydraulics

signifies that branch of the science of hydrodynamics which treats of the motion of fluids issuing from orifices and tubes in reservoirs, or moving in pipes, canals, or rivers, oscillating in waves, or opposing a resistance to the progress of solid bodies at rest.

We can readily imagine that if a hole of given dimensions be pierced in the sides or bottom of a vessel kept constantly full, the expenditure ought to be measured by the amplitude of the opening, and the height of the liquid column.

If we isolate the column above the orifice by a tube, it appears evident that the fluid will fall freely, and follow the laws of gravity. But experiment proves that this is not exactly the case, on account of the resistances and forces which act in a contrary direction, and destroy part of, or the whole, effect. The development of these forces is so extremely complicated that it becomes necessary to adopt some auxiliary hypothesis or abbreviation in order to obtain approximate results. Hence the science of hydrodynamics is entirely indebted to experiment. The fundamental problem of it is to determine the efflux of a vein of water or any other fluid issuing from an aperture made in the sides or bottom of a vessel kept constantly full, or allowed to empty itself. Torricelli had demonstrated that, abstracting the resistances, the velocities of fluids issuing from very small orifices followed the subduplicate ratio of the pressures. This law had been, in a measure, confused by subsequent writers, in consequence of the discrepancies which appeared to exist between the theory and experiment, until Varnignon remarked, that when water escaped from a small opening made in the bottom of a cylindrical vessel, there appeared to be very little, or scarcely any, sensible motion in the particles of the water; from which he concluded that the law of acceleration existed, and that the particles which escaped at every instant of time received their motion simply from the pressure produced by the weight of the fluid column above the orifice; and that the quantity of motion or expenditure is in the ratio of the breadth of the orifice, multiplied by the square of the velocity, or, in other words, that the height of the water in the vessel is proportional to the square of the velocity with which it escapes; which is precisely the theorem of Torricelli. This mode of reasoning is in some degree vague, because it supposes that the small mass which escapes from the vessel at each instant of time acquires its velocity from the pressure of the column immediately above the orifice. But supposing, as is natural, that the weight of the column acts on the particle during the time it takes to issue from the vessel, it is clear that this particle will receive an accelerated motion, whose quantity in a given time will be proportional to the pressure multiplied by the time: hence the product of the weight of the column by the time of its issuing from the orifice, will be equal to the product of the mass of this particle by the velocity it will have acquired; and as the mass is the product of the opening of the orifice, by the small space which the particle describes in issuing from the orifice, it follows that the height of the column will be as the square of the velocity acquired. This theory is the more correct the more the fluid approaches to a perfect state of repose, and the more the dimensions of the vessel exceed the dimensions of the orifice. By a contrary mode of reasoning, this theory became insufficient to determine the motions of fluids through pipes of small diameters. It is necessary, therefore, to con-

sider all the motions of the particles of fluids, and examine how they are changed and altered by the figure of the conduit. But experiment teaches us that when a pipe has a different direction from the vertical one, the different horizontal sections of the fluid preserve their parallelism, the sections following taking the place of the preceding ones, and so on; from which it follows, (on account of the [sensible] incompressibility of the fluid,) that the velocity of each horizontal section or plate, taken vertically, ought to be in the inverse ratio of the diameter of the section. It suffices, therefore, to determine the motion of a single section, and the problem then becomes analogous to the vibration of a compound pendulum, by which, according to the theory of James Bernoulli, the motions acquired and lost at each instant of time form an equilibrium, as may be supposed to take place with the different sections of a fluid in a pipe, each section being animated with velocities acquired and lost at every instant of time.

The theory of Bernoulli had not been proposed by him until long after the discovery of the indirect principle of *vis viva* by Huygens. The same was the case with the problem of the motions of fluids issuing from vessels, and it is surprising that no advantage had been taken of it earlier. Michellotti, in his experimental researches, *de Separatione Fluidorum in Corpore Animalis*, in rejecting the theory of the Newtonian cataract, (which had been advanced in Newton's Mathematical Principles, in the year 1687, but afterwards corrected in the year 1714,) supposes the water to escape from an orifice in the bottom of a vessel kept constantly full, with a velocity produced by the height of the superior surface; and that if, immediately above the lowest plate of water escaping from the orifice, the column of water be frozen, the weight of the column will have no effect on the velocity of the water issuing from the orifice; and that if this solid column be at once changed to its liquid state, the effect will remain the same. The Marquis Poleni, in his work *De Castellis per quæ derivantur Fluviorum Aquæ*, published at Padua, in the year 1718, shows from many experiments, that if A be the orifice, and H the height of the column above it, the quantity of water which issues in a given time is represented by  $2 A H \times 0.571$

whereas, if it spouted out from the orifice with a velocity acquired by falling from the height H, it ought to be exactly  $2 A H$ , so that experiment only gives a little more than half the quantity promised by the theory; hence, if we were to calculate from these experiments the velocity that the water ought to have to furnish the necessary quantity, we should find that it would hardly make it re-ascend one third of its height. These experiments would have been quite contrary to expectation, had not Sir Isaac Newton observed that water issuing from an orifice  $\frac{1}{4}$ ths of an inch in diameter was contracted  $\frac{3}{4}$  of the diameter of the orifice, so that the cylinder of water which actually issued was less than it ought to have been, according to the theory, in the ratio of 441 to 625; and augmenting it in this proportion, the opening should have been  $2 A H \times 0.805$

whereas, if it spouted out from the orifice with a velocity acquired by falling from the height H, it ought to be exactly  $2 A H$ , so that experiment only gives a little more than half the quantity promised by the theory; hence, if we were to calculate from these experiments the velocity that the water ought to have to furnish the necessary quantity, we should find that it would hardly make it re-ascend one third of its height. These experiments would have been quite contrary to expectation, had not Sir Isaac Newton observed that water issuing from an orifice  $\frac{1}{4}$ ths of an inch in diameter was contracted  $\frac{3}{4}$  of the diameter of the orifice, so that the cylinder of water which actually issued was less than it ought to have been, according to the theory, in the ratio of 441 to 625; and augmenting it in this proportion, the opening should have been  $2 A H \times 0.805$

whereas, if it spouted out from the orifice with a velocity acquired by falling from the height H, it ought to be exactly  $2 A H$ , so that experiment only gives a little more than half the quantity promised by the theory; hence, if we were to calculate from these experiments the velocity that the water ought to have to furnish the necessary quantity, we should find that it would hardly make it re-ascend one third of its height. These experiments would have been quite contrary to expectation, had not Sir Isaac Newton observed that water issuing from an orifice  $\frac{1}{4}$ ths of an inch in diameter was contracted  $\frac{3}{4}$  of the diameter of the orifice, so that the cylinder of water which actually issued was less than it ought to have been, according to the theory, in the ratio of 441 to 625; and augmenting it in this proportion, the opening should have been  $2 A H \times 0.805$

tions, namely, the perfect fluidity and sensibility of the mass, which was neither affected by friction nor cohesion, and an infinitely small thickness in the edge of the aperture.

Daniel Bernoulli, in his great work, *Hydrodynamica, seu de Viribus et Motibus Fluidorum Commentaria*, published at Strasburg in the year 1738, in considering the efflux of water from an orifice in the bottom of a vessel, conceives the fluid to be divided into an infinite number of horizontal strata, on the following suppositions, namely, that the upper surface of the fluid always preserves its horizontality; that the fluid forms a continuous mass; that the velocities vary by insensible gradations, like those of heavy bodies; and that every point of the same stratum descends vertically with the same velocity, which is inversely proportional to the area of the base of the stratum; that all sections thus retaining their parallelism are contiguous, and change their velocities imperceptibly; and that there is always an equality between the vertical descent and ascent, or *vis viva*: hence he arrives, by a very simple and elegant process, to the equations of the problem, and applies its general formulæ to several cases of practical utility. When the figure of the vessel is not subject to the law of continuity, or when sudden and finite changes take place in the velocities of the section, there is a loss of *vis viva*, and the equations require to be modified. John Bernoulli and Maclaurin arrived at the same conclusions by different steps, somewhat analogous to the catarract of Newton. The investigations of D'Alembert had been directed principally to the dynamics of solid bodies, until it occurred to him to apply them to fluids; but in following the steps of Bernoulli he discovered a formula applicable to the motions of fluids, and reducible to the ordinary laws of hydrostatics. The application of his theory to elastic and non-elastic bodies, and the determination of the motions of fluids in flexible pipes, together with his investigations relative to the resistance of pipes, place him high in the ranks of those who have contributed to the perfection of the science.

The celebrated Euler, to whom every branch of science owes such deep obligations, seems to have paid particular attention to the subject of hydrodynamics; and in attempting to reduce the whole of it to uniform and general formulæ, he exhibited a beautiful example of the application of analytical investigation to the solution of a great variety of problems for which he was so famous. The Memoirs of the Academy of Berlin, from the year 1768 to 1771, contain numerous papers relative to fluids flowing from orifices in vessels, and through pipes of constant or variable diameters. "But it is greatly to be regretted," says M. Prony, "that Euler had not treated of friction and cohesion, as his theory of the linear motion of air would have applied to the motions of fluids through pipes and conduits, had he not always reasoned on the hypothesis of mathematical fluidity independently of the resistances which modify it."

In the year 1765 a very complete work was published at Milan by Paul Lecchi, a celebrated Milanese engineer, entitled *Idrostatica esaminata ne' suoi Principi e Stabilita nelle suoi Regole della Mensura della Acque correnti*, containing a complete examination of all the different theories which had been proposed to explain the phenomena of effluent water, and the doctrine of the resistance of fluids. The author treats of the velocity and quantity of water, whether

absolutely or relatively, which issues from orifices in vessels and reservoirs, according to their different altitudes, and inquires how far the law applies to masses of water flowing in canals and rivers, the velocities and quantities of which he gives the methods of measuring. The extensive and successful practice of Lecchi as an engineer added much to the reputation of his work.\*

In the year 1764, Professor Michelotti, of Turin, undertook, at the expense of the King of Sardinia, a very extensive series of experiments on running water, issuing orifices, and additional tubes placed at different heights in a tower of the finest masonry, twenty feet in height and three feet square inside. The water was supplied by a channel two feet in width, and under pressures of from five to twenty-two feet. The effluent waters were conveyed into a reservoir of ample area, by canals of brick-work lined with stucco, and having various forms and declivities; and the experiments, particularly on the efflux of water through differently shaped orifices, and additional tubes of different lengths, were most numerous and accurate; and Michelotti was the first who gave representations of the changes which take place in the figure of the fluid vein, after it has issued from the orifice. His experiments on the velocities of rivers, by means of the bent tube of Pitot, and by an instrument resembling a water-wheel, called the *stadera idraulica*, are numerous and interesting; but, unfortunately, their reduction is complicated with such various circumstances, that it is difficult to derive from them any satisfactory conclusions. But Michelotti is justly entitled to the merit of having made the greatest revolution in the science by experimental investigation.† The example of Michelotti gave a fresh stimulus to the exertions of the French philosophers, to whom, after the Italians, the science owes the greatest obligations. Accordingly, the Abbe Bossut, a most zealous and enlightened cultivator of hydrodynamics, undertook, at the expense of the French government, a most extensive and accurate series of experiments, which he published in the year 1771, and a more enlarged edition, in two volumes, in the year 1786, entitled *Traite Theorique et Experimental d'Hydrodynamique*. The first volume treats of the general principles of hydrostatics and hydraulics, including the pressure and equilibrium of non-elastic and elastic fluids against inflexible and flexible vessels; the thickness of pipes to resist the pressure of stagnant fluids; the rise of water in barometers and pumps, and the pressure and equilibrium of floating bodies; the general principles of the motions of fluids through orifices of different shapes, and their friction and resistance against the orifices; the oscillations of water in syphons; the percussion and resistance of fluids against solids; and machines moved by the action and re-action of water. The second volume gives a great variety of experiments on the motions of water through orifices and pipes and fountains; their resistance in rectangular or curvilinear channels, and against solids moving through them; and, lastly, of the fire—or steam-engine. In the course of these experiments, he found that when the water flowed through an orifice in a thin plate, the contraction of the fluid vein diminished the discharge in the ratio of 16 to 10; and when the fluid was discharged through an additional tube, two or three inches in length, the theoretical discharge was diminished only in the

ratio of 16 to 13. In examining the effects of friction, Bossut found that small orifices discharged less water in proportion than large ones, on account of friction, and that, as the height of the reservoir augmented, the fluid vein contracted likewise; and by combining these two circumstances together, he has furnished the means of measuring with precision the quantity of water discharged either from simple orifices or additional tubes, whether the vessels be constantly full, or be allowed to empty themselves. He endeavored to point out the law by which the diminution of expenditure takes place, according to the increase in the length of the pipe or the number of its bends; he examined the effect of friction in diminishing the velocity of a stream in rectangular and curvilinear channels; and showed that in an open canal, with the same height of reservoir, the same quantity of water is always discharged, whatever be the declivity and length; that the velocities of the waters in the canal are not as the square roots of the declivities; and that in equal declivities and depth of the canal the velocities are not exactly as the quantities of water discharged; and he considers the variations which take place in the velocity and level of the waters, when two rivers unite, and the manner in which they establish their beds.

His experiments, in conjunction with D'Alembert and Coudoreet, on the resistance of fluids, in the 1777, and his subsequent application of them to all kinds of surfaces, including the shock and resistance of water wheels, have justly entitled him to the gratitude of posterity. The Abbe Bossut had opened out a new career of experiments; but the most difficult and important problem remaining to be solved related to rivers. It was easy to perform experiments with water running through pipes and conduits on a small scale, under given and determined circumstances: but when the mass or fluid rolled in channels of unequal capacities, and which were composed of every kind of material, from the rocks amongst which it accumulated to the gravel and sand through which it forces a passage,—at first a rapid and impetuous torrent, but latterly holding a calm and majestic course,—sometimes forming sand-banks and islands, at other times destroying them,—at all times capricious, and subject to variation in its force and direction by the slightest obstacles,—it appeared impossible to submit them to any general law.

(To be continued.)

It seems that the tolls on the Pennsylvania Canals and Railroads, are to be reduced twenty per cent. from the time the navigation opens in the Spring.

**PUBLIC LANDS.**—From one of the documents accompanying the Report of the Secretary of the Treasury, it appears that during the year ending 31st December, 1833, there were sold of the public lands, 3,866,227,056 acres, for \$4,972,284 84; and that the amount received in cash was \$4,550,221 99, in forfeited land stock \$47,230 55, in military land scrip \$365,832 30—making a total of \$4,972,284 84, as above. The amount of incidental expenses was \$153,268 33; and the amount paid into the Treasury, \$3,967,681 55.

During the first three quarters of 1834, there were sold 2,372,931,035 acres, for \$2,996,596 01, of which \$2,821,291 78 were paid in cash, \$19,065 27 in forfeited land stock, and \$156,238 95 in military land scrip. Incidental expenses, \$115,799 79. Paid into the Treasury during the same period, \$3,076,476 50.

## AGRICULTURE, &amp;c.

[From the New-York Farmer.]

## WHEAT AND SOIL OF WEST NEW-YORK.

—We do not believe either, theory, or the most improved practice, will bear out the writer in his maxim, at the conclusion of the following extract from the Genesee Farmer. From the experiments that have been made in various sections of our primitive country, and from our notions of scientific agriculture, we believe many farmers who now enjoy good water, will be enabled to raise as good wheat as grows in the Genesee country.

The territory of New-York, included between Lake Ontario on the north, Lake Erie on the west, the line which divides the waters flowing into the lake from those which flow to the Susquehanna and Mississippi, on the south, and the counties of Madison, Oneida and Oswego, on the east—a tract of country about 50 miles in width by 150 in length, and containing not far from 8000 square miles,—is unquestionably one of the finest farming countries in the world, and possesses within itself more sources of agricultural wealth than any portion of the United States. In the amount of quantity, and excellence of quality, of its wheat, it is confessedly without a rival; and owing to peculiar causes, unless there is the most gross mismanagement in the treatment of the soil, this superiority it must retain. Lime and gypsum, two of the substances most relied on for keeping land in good heart, or restoring that which has been impoverished by bad management, are found in almost every section of this district in inexhaustible quantities; and in these two minerals, aided by the other means within the reach of the husbandman, is found a resource, which, if used with ordinary skill, cannot fail to render West New-York for ages, perhaps for ever, deserving its present high reputation of being the granary of America. In this territory wheat is, and probably will be, the great staple; to its culture, then, the attention of our farmers generally is directed; and any thing which has a tendency to prepare the soil for this valuable crop, or prevent the exhaustion of those peculiar qualities, on which the excellence of the wheat grown is founded, will receive a paramount regard. That there is a great difference in the capability for making fine flour in wheat grown on the northern or southern slope of West New-York, is so well known, that no proof of the fact need be adduced. Experienced millers have assured us, that this difference is equal to at least ten per cent. The wheat kernel, to be good, must be plump, thin skinned, and exhibit, whenever cut or broken, a body white of itself, and which is converted into flour by the slightest process. Inferior wheat, on the contrary, will be hard, dark colored, and when cut or broken, appear solid, smooth, and tenacious; such wheat can never make the first quality of flour. It is only on lands where lime is abundant, or where what is termed the hardness of the water indicates its extensive prevalence in the soil, that the finest wheat is produced. It may be set down as a maxim in practical husbandry, that good water, and good wheat land, are incompatible with each other; or in other words, that countries of primitive formation are not by nature adapted to wheat.

**CORN—IMPROVED HUSBANDRY.**—In the National Intelligencer we find the following

extract from the Journal of a Traveller for agricultural information. We would recommend every young farmer, in particular, to travel in good farming districts, and to keep a diary of all he sees and hears that is, or may be, of importance.

Nov. 1, 1834.—Visited Mr. John Semmes, of St. Mary's county, Maryland, who informs us that his great crop of corn averaged upwards of twenty-five barrels the acre. Respectable judges of the county were appointed to ascertain the quantity of corn; and, after having accurately surveyed one acre, the corn was gathered and measured. First, a barrel being shelled to ascertain the accuracy of the barrel, eighteen or twenty of the respectable gentlemen of the county and of the adjoining county were present, saw the land measured, saw the corn measured, and are ready at any time to testify the fact, that the average acre, measured in their presence, amounted to twenty-five barrels and some pecks per acre. This farm is situated on the Patuxent river, fifteen miles below the "Cool Springs," or Charlotte Hall, and adjoining the farm on which Cole's Tobacco Inspection is—and the third from the Queen Tree. The farm is uncommonly hilly.

**Process.**—He prepares his ground by clover, the ground laid off from five by two and a half to three feet. The corn then dropped, three grains in the check, followed by persons who drop on the corn, or even if they are in advance of the corn droppers, a handful of two-thirds slacked ashes, and one-third plaster, mixed before it is dropped. Should the corn not come up regularly, he drops one or two seeds more, as may be necessary. He gathers his seed corn from the field before gathering the crop, so as to have a choice of ears. He plants from the 1st to the 10th of April, and ploughs four inches deep.

**EARLY CORN AND WHEAT.**—The following article was communicated to the N. E. Farmer by the Hon. Samuel Lathrop. We wish it was more general among men of influence to show their respect for agriculture, by communicating to periodicals the results of their experience and observation.

Last year, H. Huxley & Co. 81 Barclay street, obtained this corn from Judge Buel. Mr. D. F. Ames, of New-Jersey, planted it after his neighbors had finished planting their white corn. Mr. A.'s ripened first. Mr. D. S. Mills, of Long Island, planted it so late that other varieties would not have come to perfection. He had a good, though not a full crop.

Dear Sir—The farmers living in the valley of Connecticut river have, within a short period, greatly extended the cultivation of wheat beyond that of former years; a considerable proportion, probably the greater part, is sown after corn. We have suffered great inconvenience, and sustained some loss, from the impracticability of getting off our corn in season to sow the ground. Grain sown very late is more liable to be winter killed, and more exposed to blast, than that which is sown in its proper time. It has repeatedly happened with me, and I have not been behind all my neighbors, that I have not been able to get through the wheat sowing till after the middle of October. This is quite too late to expect a good crop. The business ought to be completed in September, and if it could be done by the middle of

that month, I think we should be more certain of success.

In the summer of 1833, I was conversing with Judge Buel, of Albany, on this subject, when he informed me, that for a number of years, he had cultivated a kind of corn which was about a fortnight earlier than the kind most commonly used, and that he thought it equally profitable for cultivation. In consequence of this information I procured my seed corn of him last spring, and planted no other this season. The crop has exceeded my expectations. I never had a better one from the same quantity of land, and it came to maturity some time earlier than other fields of corn in the vicinity. I think it will prove a valuable species to those who wish to sow their land with wheat. In ordinary seasons, it will have become sufficiently ripe for harvest by the middle of September. It is a species of the twelve-rowed corn, but the growth of stalk is very small, compared with the twelve-rowed corn which I have been accustomed to plant—not exceeding one half the weight; of course, the exhaustion required to sustain an equal number of stalks is much less. This species of corn will bear planting much thicker than any other kind of field corn which I have ever cultivated. I this year planted the hills three feet apart in both directions, intending to have three stalks in each hill. But it may be planted three feet by two and a half, and then the ground will not be more shaded than it is with the corn generally raised here, when planted in squares of three and a half feet. The ears set low on the stalk, grow to a good size, and the grain is heavy. I think it is as valuable for use as any other kind of this grain; and from the fact that it will bear planting so thick, I believe that I can secure a larger product than from any other that I have ever tried. But the circumstance that gives it its chief excellence in my estimation, arises from the fact, that I can gather my corn in season for the sowing of wheat. In the most unfavorable season, the wheat may be sown in September, and in very favorable seasons, early in that month.

I am, very respectfully, yours, &c.  
SAMUEL LATHROP.  
West Springfield, Oct. 23, 1834.

**Gypsum.**—Raspail has decided, as the result of a series of experiments, that "it is not the leaves of the leguminous plants that absorb the gypsum which is dusted over them, but the roots, when the dew or rain has washed it into the soil; and hence the advantage which has been found of applying this powder a little before the dew comes on." It was the practice of John Taylor, conspicuously known as the author of *Arator*, and one of the best practical farmers in Virginia, to sow his plaster for tillage crops before the last ploughing, that it might be buried in the soil, where the roots of plants required it. In applying it to grass lands, he recommended, if our memory serves us, that it be applied early, that the spring rains might convey it to the roots. We have, in the pamphlet of Judge Peters, upon the application of Gypsum, another corroboration of the correctness of M. Raspail's conclusions. In many instances, there narrated, where the gypsum was sown at the commencement of a drought, or late in the season, it produced no apparent benefit that year. It would be useful if farmers would satisfy themselves upon this head, by sowing a part of a field early and a part late—a part before the last ploughing, and a part upon the growing crop. So far as our opinions have been formed from practice, they are in favor of sowing on grass in

April, and for tilled crops before the last ploughing.

*Mr. Nutt's System of Bee Management.*  
(From the London Mechanics' Magazine.)

MR. EDITOR,—After the notice of Mr. Nutt's intended publication of a Treatise on the Management of Bees, I anxiously waited for its appearance, and became possessed of a copy. After reading it through I wrote him a long letter, inquiring the cause of the opposition he stated he had met with, and offering my services gratuitously to introduce his system in the West of England. This letter Mr. Nutt (in an answer to a letter sent subsequently to his agent in London,) says he never received, and as the dead letter office has not returned it, the inference is, that it must have been improperly intercepted by some one—by one of those, perhaps, whom Mr. Nutt classes as his very "particular friends." Be this as it may, a misunderstanding between us has been the consequence, and our correspondence has ceased. I shall say little now, either of Mr. Nutt as an author, or of his friends who defend him. My purpose in addressing you is simply to state a few facts favorable to Mr. Nutt's system, which have come within my own experience, and which seem to me to invalidate the principal objections brought against it by your anonymous correspondent J. P. T. Nor should I have condescended to answer a person who seems afraid to be known in his attacks on an inoffensive individual, were it not that the Editor of the Mechanics' Magazine has in a manner identified himself with J. P. T., by the note which he has subjoined to one of his communications.\*

First, then, as to "swarming from necessity or choice." I have two sets of collateral boxes, one stocked on the 24th, the other on the 28th of May last. The bees have filled the first with combs and honey entirely. One side box is full of combs, and partly full of honey. The bell-glass is about one third full of combs, and partly supplied by honey also; my bell-glasses will contain twice as much as the largest I have seen from Mr. Nutt. From this it must be evident that my bees must have swarmed "from necessity," had I not prevented this by the "move" recommended by Mr. Nutt, or something else tantamount to it. That they did not choose to swarm is evident from the work they performed after an enlargement was granted them. The swarm in the second set of boxes has filled the centre box and the glass just the same as the other; added to which, each swarm has partly filled another box, and then returned to the colony. (See hereafter.)

Mr. Nutt's glass on the centre box is

\* Not so; we only so far sided with our correspondent, as to say that his strictures had led us to think less favorably of Mr. Nutt's system and his book than we originally did, and that these charges had not been met as they might and ought to have been, if unfounded, by the two other correspondents who undertook Mr. Nutt's vindication, and who, we may add, are persons that must be able, if any body can, to vindicate it most effectually.—Ed. M. M.

not an abandonment of "his so much lauded ventilating system," that glass being itself also ventilated.

The comparing Mr. Nutt's prevention of swarming to a farmer preventing his ewes having lambs is not good reasoning. If a farmer could make his ewes to produce mutton and wool without the butcher's knife, then the cases would be parallel; but Mr. Nutt's plan is to get the honey without killing the bees. The moment the bees become too numerous for the box where they are first located, they are permitted to enter another box that is empty; the full one has its contents removed, and again is replaced on the stool until wanted, and so on. How, then, can the comparison be borne out?

I do not know what Mr. Huish means by his bees being "very lively," when the thermometer fell 20° below freezing. My bees are never very active when the thermometer is 20° above freezing. I would also add, that I attribute my success in keeping bees, when many of my neighbors lose them, to the simple circumstance of mine being out of the influence of the sun during winter; in fact, my hives are for weeks, and even months together, as still as if no bees were in them.

In reference to moving bees, we pay no attention to it in this part of the country; we move them to suit our convenience, as in changing of residences, selling or exchanging hives, putting them out on the half, and so on—never supposing but what bees can find their way back to any plate from whence they have once started; we always, when we do remove them, do so after they are quietly housed at night.

Your correspondent says, "Mr. Nutt has so mystified the description of his hive that no person in the world can understand it." Now mark this, sir: my boxes were all made with their appendages according to the directions and plates given in Mr. Nutt's Treatise, since which I have seen a set from Mr. Nutt, sent to a lady near Penzance, and I find that I have not mistaken him in any one point. So much, then, for your correspondent's acuteness of perception. Another striking proof of it is, that he cannot understand the size of the dividing tins to be inserted between the boxes, when preparing to take off a side box. Of what size should they be? Surely, long enough and wide enough to stop the communication between the two. Attend again to what he says of regulating the temperature: "After all the fuss, too, about thermometers, there is no mention made in this chapter, nor any part of the book, where they should be inserted into the hive." Why, into the ventilator, to be sure, which is a perforated tin tube placed there on purpose.

To show, further, how carelessly, as well as with what prejudice, your correspondent must have read Mr. Nutt's treatise, he calls a mere block, or door, if you please, a drawer in common with the feeder, which is a drawer. These block fronts I used this season to try the experiment of taking off a side box, in which

I so far succeeded that I did not injure a single bee, that I could discover. I introduce the dividing tin carefully and slowly between the boxes, as directed by Mr. Nutt, although your correspondent says Mr. Nutt gives no such directions. There is no frame-work needed to support the combs: this I have proved over and over in cottage hives, and never even put a pint through the crown, as some persons do. I have proved it also in the boxes and glasses to my entire satisfaction. My bees, on being admitted into a side box, will take possession without "coaxing" at all. I take the box, clean it well out, rub it with a little honey, the smell of which will remove all other, if any existed, though I know not that it is at all needful; but we always prepare cottage hives to receive a swarm by rubbing it with something to make it grateful to them. I should think in about two or three hours after the communication was opened, in the three cases I tried, bees to the quantity of good swarms took possession of the boxes, and remained quietly to work as in the boxes they before occupied.

I do not recollect Mr. Nutt saying "he cannot himself, without great difficulty, take a box away from his own hive." I had no difficulty, danger, or accident to myself or to the bees, in two experiments tried this season—the boxes with the combs still remain for inspection. Your correspondent also says, in reference to Mr. Nutt's letting a swarm hang with a sheet before them until evening, that "my bees with such treatment would have fled away." A man I know in Breage told me this summer that he has frequently shook his bees after he had returned from Wheel Vor, a distance of three miles, after six o'clock in the evening, and on one occasion they swarmed so early as nine o'clock in the morning. The first swarm of my own, alluded to above, swarmed and settled in an apple-tree, after which a messenger was procured, and sent to me then two miles off. I went myself, and shook them in Mr. Nutt's box for the first time. The reason was I had the key of the room in my pocket, and my friends could not get at the box. The man's bees, above noticed, were left so long because his wife was afraid of them, and his dwelling was in a lonely place.

The above are facts that may be doubted, but cannot be disproved. Another season, I may, if you desire it, favor you with my further progress; or I may, in the mean time, with your permission, point out some other matters your correspondent has very much erred in.

GEORGE WILLIAM WOOD.

Gerno, near Helston, Cornwall, Oct. 1, 1834.

SCYTHE SNEATHS.—Mr. Silas Lamson of Cummington, has a great reputation for good scythe sneaths. He employs about fifteen hands, and makes nearly two hundred a day. He intends to manufacture fifty thousand a year, and the proceeds of his sale will not fall much short of \$25,000 annually! This is but one specimen of Yankee thrift and industry.

**CONVERSION OF SALT WATER INTO FRESH.**—An important and completely successful experiment has been made by Mr. Wells, as to the conversion of sea water into a perfectly fresh and pure liquid, fit for every purpose of domestic use. The apparatus consists of a cast-iron cooking machine, about four feet in height, and the same in width, and contains ovens, roasting fires, pots, pans, kettles, &c., sufficient to dress a dinner for seventy or eighty men. The consumption of fuel is about two bushels in twenty-four hours; and by the internal application of the heated air, by means of tubes surrounding the various parts of the machine, roasting, boiling, and baking, are carried on with the utmost regularity and precision. Whilst the cooking is proceeding, the sea water is gradually supplied from a cask or tank, and passing into the interior of the machine, is there submitted to distillation. In its distilled state it flows into a pipe of cast iron, or of copper, tinned, which pipe is led over the bow of the vessel, and along the cut-water into the sea, and thence along the bottom of the vessel, till it returns into the hold, where a common stop-cock draws off the water. The grand improvement is the making the element in which the vessel floats the condenser of the altered liquid, which runs off at about the rate of a quart a minute, perfectly fit for drinking, washing, or any of the other purposes for which fresh water is employed. The patentee then filters it through charcoal, to restore the carbon which has been lost in the distilling. This invention will render the watering of ships unnecessary, and the room hitherto required to stow water may be used for goods.—[Literary Gazette.]

Would not the room required for the stowage of fuel to carry on the process be equal to that required for water?

**HABITS OF SPIDERS.**—M. Walckenaert related before the Entomological Society of France, the following curious fact, which is given on the authority of Mr. Spence. Having placed a large full grown spider, of the species *Epeira diademata*, on a cane planted upright in the midst of a stream of waters, he saw it descend the cane several times, and remount when it had arrived at the surface of the water. Suddenly he altogether lost sight of it, but a few minutes afterwards, to his great astonishment, he perceived it quietly pursuing its own way on the other side of the stream. *Epeira* having spun two threads along the cane, had cut one of them, which, carried by the wind, had become attached to some object on the bank and so served the spider as a bridge across the water. Mr. Spence believes that spiders, when adult, always use similar means to cross water. M. le Pelletier de Saint Fargere also supported the opinion.—[L'Institute.]

**SALTING BUTTER.**—The quantity of salt for butter that is not to be eaten for several months after salting, should not be less than half an ounce of salt, mixed with 2 drachms of sugar and two drachms of nitre, to six-

teen ounces of butter. The sugar improves the taste, and the nitre gives the butter a better color, while both of them act with the salt in preserving the butter from rancidity. If the salt is not minutely mixed into the butter, that on which it rests will have a yellow or brownish color, while the rest will be of a white color, which, in dairy language, is termed "pyety butter," that brings an inferior price. But although the butter has to be kneaded among the water, and the salt well mixed into it, care must be taken not to bake or knead it too much, otherwise it will become tough and gluey.—[Quar. Journal.]

[From the Baltimore American.]

The performances of the Ice boat during the past week have not only been completely successful, but have far exceeded any expectations which had been formed of her efficiency. Our eastern friends, whose harbors have all been blocked up by ice, will scarcely credit us, when we tell them that we have a steamboat which has not ceased operations for a single day since the late cold weather set in, but has forced a passage through the ice—thick and hard as it has been—with one or more vessels in tow. The Relief was built by gentlemen of our city, of great practical experience, for the express purpose of keeping open a passage into and out of the harbor in the winter season, and it is no faint praise to say that they have planned a boat which has fully answered this object, and whose operations have been attended with a success which has never yet been attained elsewhere.

The most remarkable performance of the Relief was on Friday last, after we had had a week of the most intensely cold weather experienced here for many years. About noon, she started from the harbour the brig Falcon in tow, and to the astonishment of all who witnessed it, made her way through ice a foot thick and of a flinty hardness. Every inch of her progress was thus impeded until she had traversed the whole length of the Patuxent, and reached the broad expanse of the Chesapeake Bay. Having placed the Falcon in a position clear of ice, from whence she could go to sea without difficulty, the Relief proceeded to Annapolis, where her entrance into the latter harbor was attended with obstacles of the same character that had been surmounted in leaving Baltimore. Her appearance there, we learn, excited no little astonishment, as it was supposed that the harbor was too firmly locked in ice to be opened by any human device. On the following day, Saturday, the Relief started from Annapolis, making a passage as she came out for the steamboat Columbus, bound to Norfolk, and reached Baltimore on the same night. Yesterday morning she started again for Annapolis, taking in tow the brig Ida, for Boston, brig Solon, and schooners Empire and Othello, for New York.

We may well say, therefore, that after the experience of the past week there can be no doubt of the ability to keep open the harbor of Baltimore in the severest winters, and that vessels may enter or depart without the hindrance experienced during the winter season in more northern ports. The achievement of this triumph is of much importance to the trade of our port, and gives to our Railroad, which is also independent of the seasons, great additional value.

For the information of persons at a distance, who may be curious on the subject, we will state that the Relief is a steamboat the model of whose bow has a close resemblance to the bowl of a table spoon. When she is propelled forward, the ice is not thrown before her, as it would be by an ordinary vessel, but passes under her bows and is broken. Her paddle wheels are of wood and iron, and some idea of their strength and adaptation to this peculiar service may be formed when we state that each wheel has in it six tons of iron.

#### MISCELLANY.

Among new works advertised in London as in the Press, is the Journal of Mrs. Butler, late Miss Kemble.

#### "THERE IS TIME ENOUGH."

This is one of the most mischievous sentences in the English language. Not that it is bad in itself—for it is strictly true, as we intend to show presently. But its meaning is sadly perverted, and what was meant for good, becomes the occasion of evil.

Many a good thing might have been done had it been begun in season, but because there was time enough it was let alone, and let alone, and so not started until too late, or never moved at all.

But there is such a thing as bringing good out of evil. The bee extracts honey, as sweet, if not as abundant, from the thistle, as from the rose. And he who would profit by studying human nature, and watching divine providence, may learn wisdom from his past errors, and turn over his misfortune to some good account.

The wisest men in ancient days, (and we believe he was fully as wise as people commonly are at present,)—the wisest men of ancient days has given us to understand that there is a time for every thing under the sun. *A time for laughter and for tears, for sorrow and for joy.* A time for business, a time for recreation, and a time for rest, but he does not say a word about leisure time, or time for idleness. He speaks too of a time to die, leaving us to infer, as we may very naturally, that He, who made the sun to rule the day, the moon and stars to govern the night, has given us time enough, just time enough, and none to spare, to perform all our duties, and to enjoy every rational pleasure—to make the world better for our having lived in it—and to become better fitted ourselves, for "Another and a better world."

There is time enough, says the schoolboy,—whose time runs out, and he goes half fitted to the counting room, or enters half fitted, at college.

Time enough,—thinks many a young man, if he does not say so, to commence habits of frugality and economy, and thus provide for future wealth—but the time never, never comes; and he, to use a homely phrase of Dr. Franklin's, "scratches a poor man's head as long as he lives."

How many designs have we formed, of doing this and that good thing, which fell through, not because we had little time; but because we had time enough, and so wasted one hour after another till the time had passed.

Time enough to work, says the idler, and spendthrift; but his clothes wear out before he finds time to earn new ones; and his pockets are emptied, and he has no time to replenish them.

Franklin has a homely saying to this effect,—that he who looses an hour in the morning, must run all day, and 'tis a wonder if he overtakes his business before night. So, if any one finds himself pinched for time, it is likely he has thrown away an hour, when he thought he had time enough and a little to spare.

Time enough—say we, when in a serious mood, we resolve to be more diligent, more systematic, more punctual; when we resolve upon any reform.

We do not mean to procrastinate; but while we muse the moment passes, it is irrecoverably lost.

Do you say we knew all this before.

No doubt of it. Yet we are apt to think there is not only time enough, but some to spare. But this is an error and should be corrected.

The different length of different lives is nothing against our position, that life is just long enough. The oldest person has enough of duty and enough of pleasure too: if he lives aright, to occupy his three score years and ten—while he whose career goes down at noon, has time enough, if he will but improve it, to make his life here a blessing to others, and that hereafter blessed and glorious to himself.

—"That life alone is long,  
Which answers life's great end."

**The Ex-Pugilistic M. P.**—Mr. Gully, M. P. for Pontefract, who attended the dinner given to the Earl of Durham at Newcastle, is the largest proprietor of the famous Hetton colliery, in the county of Durham. Mr. Gully is said to have invested upwards of £160,000 in that very extensive coal mine.

**THE DEEPEST MINE IN GREAT BRITAIN.**—The shaft at present sinking at Monkwearmouth Colliery, near Sunderland, has attained a considerably greater depth than any mine in Great Britain (or estimating its depth from the level of the sea, than any in the world). Pearce's shaft at the Consolidated Mines in Cornwall was, till lately, the deepest in the island, being about 1470 feet in perpendicular depth, of which 1150 feet are below the surface of the sea. The bottom of Woolf's shaft (also at the Consolidated Mines) is 1230 feet below the sea; but its total depth is less than that of Pearce's shaft. The bottom of the Monkwearmouth shaft is already upwards of 1500 feet below high water mark, and 1600 feet below the surface of the ground. It was commenced in May 1830. The upper part of the shaft passes through the lower magnesian limestone strata which overlap the south-eastern district of the Great Newcastle Coal-field, and which, including a stratum of "free-stone sand" at the bottom of the limestone, extended at Monkwearmouth to the thickness of 330 feet, and discharged towards the bottom of the strata the prodigious quantity of 3000 gallons of water per minute,—for the raising of which into an off-take draft, a double acting steam engine, working with a power of from 180 to 200 horses was found necessary. The first unequivocal stratum of the coal formation, viz. a bed of coal 1.2 inches thick, was not reached till August 1831 (being about 344 feet below the surface, after which the tremendous influx of water which had so long impeded the sinking operations was "stopped back" by a cylindrical "metal tubing" or casing, fitted (in a series of small portions) to the shaft, and extending from below the above bed of coal to within 26 yards of the surface. The sinking now proceeded with spirit—still no valuable bed of coal was reached, although the shaft had passed considerably above 600 feet into the coal measures, and much deeper than had hitherto been found requisite for reaching some of the known seams. It became evident that the miners were in unknown ground. A new "feeder of water" was encountered at the great depth of 1000 feet, requiring fresh pumps and a fresh outlay of money. The prospects of the owners became unpromising in the eyes of most men, and were denounced as hopeless by many of the coal-viewers! Coal-viewing, however, had as yet been limited to some 200 or 220 fathoms; and the views of the Messrs. Pemberton (the enterprising owners of this colliery) were not to be bounded by such ordinary depths; they considered rightly that the thickness of the coal formation might be vastly greater where protected by the superincumbent limestone, than where exposed to those denudations which in the neighborhood of the "rice" collieries had probably swept away the strata through which their own shaft had hitherto been sunk; that they were therefore, justified in anticipating the larger and known seams at greater depths; and that, in case these larger seams had (as was intimated) been split into smaller strata, the same causes which in other places had produced their subdivision might, at Monkwearmouth, have effected their junction. They continued, therefore, their sinking, and in October last reached a seam of considerable value and thickness, at the depth of 1578 feet below the surface; and presuming that this newly discovered seam was identified with the Benham seam of the Tyne (or Maudlin seam of the Wear), they are rapidly deepening their shaft, in anticipation of reaching the Hutton or most valuable seam at no distant period, but which (if their anticipations are well founded) will be found at a depth approaching 300 fathoms from the surface!! In the mean time, however, workings have very recently commenced in the supposed Benham seam. A party of scientific gentlemen descended into these workings on Saturday last, and, aided by every facility and assistance which could be afforded to them by the Messrs. Pemberton, made several barometric and thermometric observations, the detail of which will be deeply interesting to many of our readers. A barometer at the top of the shaft (87 feet above high water mark) stood at 30.518, its attached thermometer (Fahrenheit) being 53. On being carried down to the new workings (1584 feet below

the top) it stood at 32.280, and in all probability higher than ever before seen by human eye; the attached thermometer being 58. Four workings or drifts had been commenced in the coal; the longest of them, being that "to the dip," 22 yards in length and nearly two in breadth—to the end of which the current of fresh air for ventilating the mine was diverted (and from which the pitmen employed in its excavation had just departed)—was selected for the following thermometric observations. Temperature of the current of air near the entrance of the drift, 62 (Fahrenheit); near the end of the drift, 63; close to the face or extremity of the drift, and beyond the current of air, 68. A piece of coal was hewn from the face; and two thermometers placed in the spot just before occupied by the coal (their bulbs being instantly covered with coal dust) rose to 71. A small pool of water was standing at the end of the drift. Temperature of this water at eleven o'clock, 70; three hours later, 69 2/2. A register thermometer was buried 18 inches deep below the floor, and about 10 yards from the entrance of the drift; forty minutes afterwards its maximum temperature was 67. Another register thermometer was similarly buried near the end of the drift, and after a similar period indicated a maximum temperature of 70. It was then placed in a deeper hole and covered with small coal; some water oozed out of the side of this hole to the depth of 6 or 8 inches above the thermometer, which, upon being examined after a sufficient interval of time, indicated a temperature 71 1/2. A stream of gas bubbles (igniting with the flame of a candle) issued through the water collected in this hole; the bulbs of two very sensible thermometers were immersed under water in this stream of gas, and indicated a temperature constantly varying between 71 5 and 72 6. A thermometer was lowered to the bottom of a hole drilled to the depth of 2 1/2 feet into the floor of another of the workings, and the atmospheric air excluded from it by a tight stopping of clay; this thermometer being raised after the lapse of forty-eight hours, stood 71 2. The above observations will accord with the prevailing (and certainly well grounded) opinion, that the temperature of the earth increases with the depth from the surface. It must not, however, be forgotten that causes may be assigned for an increase of temperature in this and other coal mines, independently of the presumed subterranean heat. Those who are familiar with coal mines must have frequently witnessed the effects of the enormous pressure of the superincumbent strata; and a weight of 25,000 to 30,000 tons, which had lately reposed upon the coal hitherto occupying the drift above described, had suddenly been transferred to the coal situate on the idea of this drift. Hence those constant indications of tremendous pressure—the cracking of its sides and roof, and "heaving of the floor," and the crumbling of their materials, furnishing admission of air and water to innumerable fragments of shale, coal, and pyrites—circumstances which are awkwardly calculated to occasion an increase of temperature, both by mechanical compression and chemical decomposition, although wholly inadequate, as we conceive, to the generation of the temperature recorded on Saturday last; and the presence and lights of the pitmen were obviously unoperative in producing the effects remarked. Other experiments, however, in the prosecution of these inquiries, are, with the obliging permission of the owners, contemplated at Monkwearmouth Colliery; and amongst the minor advantages arising from their magnificent undertaking, will doubtless be the solution of any remaining doubts of the existence of considerable subterranean heat at accessible depths, beneath the surface of the earth. —[Durham Adv.]

**REVENUES OF THE GERMAN STATES.**—The second part of the fifth volume of the work entitled "Archives of the New Legislation of all the States of Germany," published by M. Alex. Muller and others, contains an interesting account of the actual state of the finances of Austria, Prussia, and the other German States; from whence it results that in the empire of Austria, the real revenue of the State amounts to 205,400,000 florins, and the debt of the State to 793,360,000 florins. The new Budget of Prussia for the years

1822—1834, according to the "Bulletin of the Laws" of 1832, No. 6, is fixed at 51,287,000 dollars. The debt of the State amounts to 170,000,000 dollars.

The revenues and debts of the other States are calculated in French francs.

	Revenue in francs.	Debts.
Bavaria.....	69,723,000	285,200,000
Wurtemberg.....	20,000,000	60,000,000
Hanover.....	97,000,000	64,000,000
Saxony.....	28,000,000	70,000,000
Grand Duchy of Baden.....	30,000,000	30,000,000
Hesse.....	17,000,000	27,000,000
Electorate of Hesse.....	11,000,000	5,000,000
Grand Duchy of Saxe Weimar.....	4,913,000	16,391,000
Meck-Schwerin.....	6,000,000	30,500,000
Meck-Strelitz.....	1,500,000	3,000,000
Holst-Oldenb.....	3,800,000	
Duchy of Nassau.....	6,000,000	9,500,000
Brunswick.....	6,300,000	8,000,000
Saxe Coburg-Gotha.....	2,500,000	11,600,000
Saxe Meiningen.....	1,930,000	8,000,000
Saxe-Altenburg.....	1,525,000	3,000,000
Anhalt-Desau.....	1,400,000	1,600,000
Anhalt-Dernbourg.....	1,100,000	1,700,000
Anhalt-Koben.....	630,000	2,100,000
Principality of Reuss-Griz.....	362,000	517,000
Reuss-Schleitz.....	336,000	
Reuss-Lobenstein.....	621,000	1,810,000
Schwarzbourg-Rud.....	800,000	600,000
Schwarzbourg-Son.....	600,000	540,000
Lippe-Deumold.....	1,267,000	1,500,000
Lippe-Schumbourg.....	556,000	1,024,000
Waldeck.....	4,034,000	3,103,000
Hohenzollern-Sig.....	500,000	2,000,000
Hohenzollern-Bec.....	310,000	700,000
Lichtenstein.....	50,000	
Landgraviate of Hesse-Hombourg.....	400,000	1,164,000
City of Frankfurt.....	1,634,000	17,000,000
Bremen.....	1,614,000	7,800,000
Hamburg.....	5,000,000	40,000,000
Lubeck.....	1,034,000	8,000,000

It results from the above table, that in Austria each individual pays 13 1/2f to cover the debt of the State; in Prussia, 14f; in Bavaria, 17 1/2f; in Wurtemberg, 12 1/2f; in Hanover, 16f; in Saxony, 18 2/3f; in the Grand Duchy of Baden, 16 2/3f; in that of Darmstadt, 23 1/2f; in the Electorate of Hesse, 16 1/2f; and in the other small states, from 11 1/2f to 23f. In France each individual pays, to cover the public debt, 23f per annum; and in England, 49f.

His Majesty has conferred a baronetcy on Felix Booth, as a mark of approbation at the munificent sum advanced by that gentleman towards defraying the cost of the last expedition of Captain Rees to the polar regions. Mr. Booth, we understand, declined for a long time to accept this mark of distinction, and we believe the honor has been at last voluntarily conferred upon him by the government.

The champagne vintage of the present year is as follows:—Verzenay, 3,000 casks, Verzy and Villers Malmsey 1,500, Reilly, Chexney, and Lude, 1,000, Bowry 1,000, Ambonnay 1,000, Ay 10,000, Mareuil and Aconay 3,000, Haut, Villiers, Dizy, and Camiers 4,000, Epemay 4,000, Pierry 4,000, Moussy 2,500, Chouly 1,500, Cramant 2,000, Avize 8,000, Oger and Mesnil 16,000, Vertus 2,000; total 64,500 casks, containing 220 bottles each, making in all 14,190,000 bottles.—According to the estimate of the number of bottles which can be procured at the different manufactories, it appears that next year, when this vintage comes to be bottled off, there will be a deficiency to the number of 3,390,000. The manufactory of M. de Poilly can furnish 2,000,000, that of M. Daube 1,500,000, that of M. de Coloret 1,200,000, that of M. de Violaine, 1,800,000, that of Messrs. Pallier and Calegois 600,000.—The Auxin factory 400,000, two others in the North 600,000, the four Lorraine factories 2,500,000, and that of Croyen 200,000; total, 10,800,000. The number required is 14,190,000; deficiency 3,390,000.—[Paris Advertiser.]

**Liberty a Plant.**—During the progress of a political meeting held in the town of Cambridge, it so happened that the late Dr. Mansel, then public orator of the University of Cambridge, but afterwards master of Trinity College and Bishop of Bristol, came to the place of meeting just as Mr. Murgrave, the well known political tailor of his day, was in the midst of a most pathetic oration, and emphatically repeating, "Liberty, liberty, gentlemen!" He paused,— "Liberty is a plant."—"So is a cabbage!" exclaimed the caustic Mansel, before Mr. Murgrave had time to repeat his sentence, with so happy an allusion to the trade of a tailor, that he was silenced amidst roars of laughter.

## NEW-YORK AMERICAN.

JANUARY 10—16, 1838.

## LITERARY NOTICES.

**THE NEW ENGLAND MAGAZINE**, for January.—Boston.—It was a bold and difficult enterprise for untired powers, to assume the editorship of this magazine, which under its founders had won its way to the highest place among American monthlies. We wish their boldness may be rewarded with success, but as yet must ascribe to the Magazine the lament,

*Non sum qualis eras.*

**THE WESTMINSTER REVIEW**, No. VII., being the 3d number of Foster's republication. New York: F. FOSTER.—The Westminster rather affects American subjects, and particularly American principles—and aims, we believe, more than any other European periodical, to acquire authority for its opinions, by referring to our example and practices. The first paper in this number is on the controversy concerning the Bank of the United States, in which it takes the side of "the brave old man" who waged, and is still waging, war against that institution, with as little perception of, or regard to, the real merits of the questions involved in the discussion, as any other headlong and passionate old man, intent upon gratifying personal resentments at any rate, would be likely to have.

As compared with either the Quarterly or Edinburgh, this whole number of the Westminster is feeble and uninteresting. From an article on the English language, we make two extracts—curious in their way.

Dr. Johnson was the first who culled from received authors some of those words to which they had given their approbation. The words comprised in his dictionary may truly be called a mere selection from those which form the language of England, when there are found in Shakespeare alone upwards of 1000 words which he rejected [*Johnson's Apology for the Believers*, &c. p. 210], and the Rev. Gilbert Wakefield, in a letter to Mr. Fox, stated that he had collected from Milton upwards of 500 solid and nervous words not in that dictionary. By the way, this may account in some measure for the inability of foreigners to appreciate, or even understand, the great national dramatist and poet. Mr. Todd

words to the number of his coins; many of them are words which his fastidious

Mr. Chalmers, in Johnson, has vainly attempted to trace. Milton's considerable number of words in the Dictionary; a dozen good words, now, such as the adulation has since been a philologist, that there common use in English in any dictionary of many of these, at 5000, have been traced from some of the parts, which they were used

Another point for examination is the manner in which many of the verbs are used. Learn me, for Teach me. To learn is the English of the Latin verb *laeran*, which implied 'doctrina' as well as 'discere' and has been employed accordingly by some of the best writers. It will be found in the 35th and 119th Psalms in the Common Prayer Book. In Richard II, the Bishop of Carlisle says, 'Then true nobleness would learn

him forbearance from so foul a wrong; and the same phrase occurs in *The Tempest*, *As You Like It*, and elsewhere.

To 'remember' another of anything, has also many good authorities in its favor, though it is now banished from polite discourse. Richard II's Queen objects to her lady telling tales of joy to her, because it will 'remember her the more of sorrow.' In King John, Constance says that grief 'remembers her' of Arthur. In the second part of Henry IV, Worcester 'remembers' the King, who were his first friends. And, nearer the present times, Richardson has the word in the same sense, in the 3d volume of *Sir Charles Grandison*, p. 157 of the 7th edition.

To 'fetch' a walk has also, though used only by the untaught in the present day, been approved by high authorities. By Milton,

*When evening gray does rise, I fetch my round  
Over the moat, and all this hallow'd ground.*

In *Cymbeline*, the Queen says, 'I'll fetch a turn about the garden,' &c. *Ast. ch. 15, v. 13.*—'And from thence we fetched a compass round,' &c.

To 'rainsate,' though used by Shakespeare and many authors of his age, and, still later, by Lord Bacon,—"Philip and Nahs were already rainsated,"—is among the proscribed verbs; as are various inflections of others in general usage, such as the following,—"It snows," for *It snowed*; which is particularly used in Norfolk and Suffolk, where the common people say, *it snows* and *it friss*. Holinshed, under the year 1583, describing the performance of a tragedy, says that among other devices, it 'saw an artificial kind of snow.' Dr. Wallis, in his *English Grammar*, published in 1653, mentions that *snow* was used as the perfect tense of the verb to snow, 'sed et utrobique, snowed.' Chaucer has 'it snowed.'

The next No. of this republication will be issued in about ten days, and will furnish, we are glad to find, the last London Quarterly, which has some capital papers, from one of which a long and interesting article will be found in another column.

**PINNOCK'S IMPROVED EDITION OF GOLDSMITH'S HISTORY OF ENGLAND**, with a continuation to the year 1833. First American from the 23d English edition. 1 vol. Philadelphia: Kay & Biddle.—This is well got up, with a variety of wood cuts, explanatory notes, and with questions for examination at the end of each section. Yet we must say, as an American school book, we prefer the *English History* we had occasion to notice some weeks ago by the author of "*American Popular Lessons*." The style and narrative of Goldsmith are more striking; but these are almost all lavished upon dissensions, civil broils and bloodshed, while little attention is given to moral character and institutions, or to domestic and social history. In these particulars, which lead the young mind to consider other national characteristics than processes to, and prowess in war, valuable, we consider that the "*English History*" above referred to, is entitled to the preference we have expressed.

**MUSEUM OF FOREIGN LITERATURE**, &c., for January; E. LITZELL, Philad.—This periodical, than which none affords more, or more varied reading, appears in an enlarged form, and henceforth will be under the direction, as to the selections, of the editor of that capital and cheap work, *Waldie's Library*. There is a good plate in this number of our old friend *Grant Thorburn*, which, if not very like as to the face, is unmistakable as to the feet. The literary contents are of the best of all the foreign magazines.

From the latest London Quarterly, we make the following extract:

## PERSONAL HISTORY OF LOUIS PHILIPPE.

The journal begins with the entrance of the young Duke de Chartres (the present King Louis Philippe) into the Jacobin club, an event of con-

siderable importance in a public view, as marking his father's adhesion to the principles of that society, and which was also the occasion of serious family dissensions. The Jacobins, we find, were so much pleased at seeing the Duke de Chartres among them, that they presented him a formal address, of which the first sentence is curious:—"Sir, we congratulate ourselves! should we not also congratulate you? You have been our prince,—you are now our colleague, &c." But that which was a matter of congratulation to the Jacobins was a source of deep affliction to his amiable and exalted mother; and became the immediate cause of an open rupture between her and Madame de Genlie, by whose counsel that princess believed that her son had taken this unhappy and degrading step. Madame de Genlie, in her Memoirs, attributes it solely to the Duke of Orleans himself; but it is, we think, clear that she must share the responsibility. We have the young Duke's evidence, that his father only approved his own proposition; and we shall see, as we proceed, that this too docile and over-factionate pupil would never have thought of making such a proposition without Madame de Genlie's previous concurrence. Her husband, M. de Sillery, proposed him,—her personal friends and the attendants whom she had placed about him all became members also. When in a year or two after, she, with her niece and Pamela, accompanied Mag'le. d'Orleans to England, they designated themselves the four Jacobin emigrants. In short, it is clear that she countenanced, and probably advised, her pupil's entry into the Jacobin club; which, however, as she justly observes, had not at this period attained its subsequent ferocity and infamy. There is another circumstance in this affair that corroborates the opinion that the plunging of the Duke of Orleans into the successive depths of democracy were chiefly prompted by moral cowardice—the Duke de Chartres became Jacobin at the moment of that violent excitement which followed the death of Messrs. de Castries and Lameth; but the father himself did not become a member of the club till the commotion occasioned by the flight of the King, when, not without some demur, he was admitted. Again, it was amidst the massacre of the 10th of August that he solicited the change of his name to *Eugénie*. We say moral cowardice, for he showed more than once, and particularly at his last hour, personal firmness. We are tempted to quote from the little known relation of an eyewitness the account of his last hours. On the 6th of November, 1793, he was brought before the revolutionary tribunal, and, after a mock trial, condemned, on a series of charges, of all of which he was notoriously guilty. He treated the dreadful mockery with contempt, and begged, as an only favor, that the sentence might be executed without delay; the bloody indignance was granted, and he was led, at four o'clock, when the daylight was almost failing, from the court to the scaffold. 'I confess,' says the editor of the Orleans correspondence, 'I had the barbarous curiosity to see him go to execution; I took my station opposite his palace, that I might observe the effect which, at his last moments, these scenes of former splendor and enjoyment might have on him. The crowd was immense, and aggravated, by its reproaches and insults, the agony of the sufferer. The fatal cart advanced at so slow a pace, that it seemed as if they were endeavoring to prolong his torments. There were many other victims in the same cart; they were all bent double, pale and stupefied by horror. Orleans alone—a striking contrast—stood upright, his head elevated, his countenance full of its natural color, with all the firmness of immobility. By a refinement of cruelty, the cart was stopped at the gate of his palace; I saw him run his eyes over the building with the tranquil air of a master, who should be examining whether it required any additional mement or repair. This air was, no doubt, studied and put on. I, as well as everybody else, could see that it was; it was even said, that he had prepared himself for it by wine; but, with all that, I was astonished. I am still astonished to think how such a man as Orleans could, by any means, have subdued his natural character, and worked himself up to such an appearance of courage and tranquility.' We return from this

digression to observe, that as to the rupture between the Duchesse of Orleans and Madame de Genlis, the latter in her memoirs, does tardy and rather reluctant, but yet complete, justice to the former. The cause, says she, of the duchess's coldness to me was evidently a difference of opinion on the politics of the day; and I am now ready to acknowledge that her fears, which at the time appeared to me so exaggerated, and even so unjust, were but too well founded. She did not permit her imagination to lead her astray—she did not abandon herself to romantic visions—her judgment, alas! was better than mine. With these preliminary observations on the state of the family, which will tend to explain some things which might otherwise obscure, we proceed to the journal itself:

We have only room to day for some extracts from this—

"Journal of Louis Philippe, Duke de Chartres."—Oct. 23, 1790.—I dined at Mousseaux—next day my father having approved my anxious wishes to become a member of the Jacobin Club, M. de Sillery proposed me on Friday, Nov. 2.—I was yesterday admitted to the Jacobins, and much applauded. I returned thanks for the kind reception that they were so good as to give me, and I assured them that I should never deviate from the sacred duties of a good patriot and a good citizen. Paris, Nov. 9.—Left Chateaufort at eleven at night, and arrived at Bellchasse at ten next day. I got on horseback at Angerville, nine leagues off; it was still dark, and I rode to Paris. In the evening I attended the Jacobins. They appointed me censor. As the hall is much too small to contain the friends of the constitution (the formal title of the club which derived its popular name from meeting at the convent of the Jacobins) whose members increase daily, a committee was named to look out for another place. They were discussing the King's household troops. M. de Mirabail, a young man, spoke remarkably well. I learned that I had been named one of the deputation to convey to the National Assembly the proposition relative to the Tennis Court. Nov. 10.—Yesterday my father sent for me, received me most kindly, and gave me fifty louis, of which I gave my brother ten. My father desired me to call on Madame de Lamballe, I went directly; and from her to the Assembly, and from that, with my father's approbation, to dine with M. Bonne-Carriere, who had been spokesman of the deputation to the Assembly.—He had invited the whole deputation and several members of the Assembly. The dinner was very gay, very patriotic, and very decent. Nov. 16.—At the Jacobins. I rose to speak, and said that I had had the honor of being admitted last year (though under age) into the Philanthropic Society. This society was in the habit of distributing 400,000 per annum; but this year the funds had fallen off by one half, because several very affluent persons had retired under pretence that the revolution prevents their contributing four louis a year. In this they have two objects—the first to discredit the revolution for having destroyed so good an institution; and secondly, to make it enemies of all the poor whose pensions should be thus stopped, by saying, it is the revolution deprives you of your bread. I said I thought that it was worthy of the club to support the Philanthropic Society, and I invited all who could afford four louis a year to belong to it, and those who could not, to contribute what they could afford. I was much applauded, and, on the motion of M. Faydel, a subscription which had been raised a month ago, for a poor man who had refused it, was transferred to the Philanthropic Society.—Nov. 19. This evening at the play to see (Voltaire's) Brutus, the audience made many allusions. When Brutus says, "Give me, ye Gods, death rather than slavery," the house rang with shouts of applause—great waving of hats. It was magnificent. Another line ended with these words, "Free and without a King." Some applause was heard, in which neither I nor any one in our box joined. Then there was a cry of God save the King, but it being observed that this cry was unconstitutional, they substituted the trill cry, which sounds so sweet in patriotic ears—God save the nation, the law, and the King and liberty for

ever. It was clear from all that passed that the patriots had a great majority over the aristocrats; three or four of these latter would have applauded some congenial allusions, but they were reduced to silence. 8th Jan. In the morning to the assembly—at six in the evening to the Jacobins. M. de Noailles presented a work on the revolution by Mr. Joseph Towers, in answer to Mr. Burke. He praised it highly, and proposed that I should be appointed to translate it. This proposition was adopted with great applause. I, like a blockhead, consented, but expressing my fear that I should not fulfil their expectations, I returned home at a quarter past seven. At night my father told me that he did not approve of it, and that I must excuse myself to the Jacobins on Sunday. June 27th. The great events which have occurred have prevented my continuing this journal. Thursday, the 23d, I attended at the head of the regiment, the procession of the Holy Sacrament. I had been required by the municipality to double the guard, to stop all carriages, and to employ the best energies of the brave patriots that I commanded to maintain the public peace. At noon I had brought back the regiment, but with orders not to unhoot or unsaddle. I asked Messrs. Dubois, D'Albie, Jacquemin, and Phillippe, to dinner. They brought us word that the people had collected in a mob and were about to hang two priests. I ran immediately to the place—I came to the door of a tavern, where I found ten or twelve national guards, the mayor, the town clerk, and a great many people, crying they have violated the law; they must be hanged *à la lanterne*. I asked the mayor what all this meant, and what it was all about. He replied, —it is an old priest (that is a priest who had not taken the new oaths) and his father, who have escaped into this house; the people pretend that they have insulted M. Buisson, a priest, who has taken the civic oath, and who was carrying the holy sacrament, and I can no longer restrain them. I have sent for a carriage to convey them away. Have the goodness to send for two dragoons to escort them. I did so immediately. There was the Mayor motionless before the door, and not opening his mouth. I therefore addressed some of the hottest of the mob, and endeavored to explain how horrible it would be to hang men without trial; that moreover they would be doing the work of the executioner, which they considered infamous; that there were judges, whose duty it was to deal with these men. The mob answered that the judges were aristocrats, and that they did not punish the guilty. I replied, that's your own fault, as they are elected by yourselves; but you must not take the law into your own hands. Upon this there was a great confusion; at last one voice cried—we will spare them for the sake of M. de Chartres. Yes, yes, yes, cried the people; he is a good patriot; he edified us all this morning [by having attended the procession of the constitutional priest.] Bring them out we shall do them no harm. I said, do you promise me? Yes, yes, we shall do them no harm. I went up to the room where the unhappy men were, and asked them if they would trust themselves to me—they said ye. I exhorted the people not to forget what they had promised. They cried out again,—be easy, they shall receive no harm. I called to the driver to bring up the carriage; upon which the crowd cried out, no carriage; on foot, on foot, that we may have the pleasure of hooting them, and expelling them ignominiously from the town. Well, I said, on foot, be it so, 'tis the same thing to me, for you are too honest to forfeit your word.—We set out amidst hisses and a torrent of abuse. I gave my arm to one of the men, and the Mayor was on the other side. Not thinking at the moment, I took the direction towards Paris. All the people followed, singing the song of the Champ de Mars, and making a dreadful uproar. One man ran up crying *à la lanterne* with the rascals.—He narrowly escaped being hoisted up himself for saying so, because, said the people, we have promised M. de Chartres, and we will keep our word. We passed a little wooden bridge of a few planks without rail: there the mob cried to throw them into the river, and endeavored, by putting sticks across, to trip them up into the water. I again reminded them of their promise, and they became quiet. The crowd was still in-

creasing. It is but justice to the people of Vendôme to say that they kept their word, and tried to induce the peasants to do no violence to the men. Seeing, however, that if I had continued my march some misfortune must inevitably occur, I cried, we must take them to prison; and then all the people cried, to prison, to prison.—Some voices cried, they must ask pardon of God, and thank M. de Chartres for their lives. That was soon done, and we set out for the prison.—As we went along, one man came forward with a gun, and said to us stand out of the way while I fire on them. Believing that he was really about to fire, I rushed forward in front of my men, saying, you shall kill me first. As the man was well dressed, M. Pieyre said to him, but how can you act so. I was only joking, says the man; my gun is not charged. We again continued our way. On arriving at the prison, there was a great crowd assembled. The dragoons were mounted by M. de Lagondie's orders.—I ordered them to dismount, saying, that the people had promised me, and that I needed no help but their word. The two men were lodged in the prison. When they were there, the people wanted to attack the Oratoire (a religious house), the superior of which has not taken the oath, and whose church was the resort of the refractory [these who did not approve of the new constitution of the clergy], and those whose children had not attended the procession—in short, of the aristocrats. I observed, that that was not the way to proceed; that they ought to request the Mayor to suggest to the superior of the Oratoire that they were displeased at seeing his church filled with the refractory. They answered, a fig for the Mayor—you may do it. I answered that I was ready to accompany the Mayor. I did so. The superior was very obstinate: he would not yield at that time, but he went off next morning. After dinner I went to the municipality, and stayed while they were drawing up the account of what had happened. I went again next day and signed it.—3d August. Happy day, I have saved a man's life, or rather have contrived to save it. This evening, after having read a little of Pope, Matiasio, and Emile, I went to bathe. Edward and I were dressing ourselves, when I heard the cry of help, help! I am drowning? I ran immediately to the cry, as did Edward, who was farther off. I came first, and could only see the tops of the person's fingers; I laid hold of that hand, which seized mine with indescribable strength, and by the way in which he held me, would have drowned me, if Edward had not come up and seized one of his legs, which deprived him of the power of jumping on me. We then got him ashore. He could scarcely speak; he expressed great gratitude to me, as well as to Edward. I go to bed happy."

At seventeen, this Journal, we repeat, is not discreditable to any man, be he Prince or Jacobin, or both.

#### SUMMARY.

The Legislature of Massachusetts met at Boston on Wednesday last. Benjamin T. Pickens, of Suffolk, was chosen President of the Senate by 30 out of 32 votes, and on the second ballot, Julius S. Rockwell was chosen Speaker of the House by 363 out of 504 votes.

LARGE CARGO.—The British ship Adam Lodge, Captain Page, cleared from Charleston on the 2d instant with a cargo of 1725 bales of cotton—65 tierces of rice—870 barrels of tar, &c.—valued at \$94,200 59.

The keeper of the Montreal jail, recently detected in some sausages brought to the prison by the brother of a condemned convict named Lane, six small files, not intended certainly for internal consumption.

The wife of Mr. David Avery, of Westminster, Vt. has presented her husband with five children within fifteen months!

Abiza Snow, of Brunswick, Me. was presented by his wife on Sunday last with three boys, weighing 21 lbs. all well at last dates.

A very important movement has been recently made among the Cherokees in Georgia, the particulars of which are given in the Southern Recorder. On the 27th November, a Council of the Nation, composed of the Chiefs and Head men who are opposed to State jurisdiction, and in favor of removing to another country, was held at Running Waters. Elias Boudinot, who is, we believe, the most influential man among the Cherokees, presided. The Council declared it to be their unanimous opinion,—and a most sound and wise opinion it unquestionably is,—that their people "cannot exist amidst a white population, subject to laws which they have no hand in making, and which they do not understand." Nor could they long exist even with entire political independence, where they are surrounded by whites, and consequently subject to their social and commercial influences.

Among the reasons assigned, in the resolutions adopted by the Council, for the opinion that the nation cannot be re-established in its present location, is stated, "the repeated refusal of the Presidents and Congress of the United States to interfere in their behalf." The Council declare, that though they love the land of their fathers, they regard the lot of exile immeasurably to be preferred to a submission to the laws of other States; and they are of opinion that a large majority of the Cherokee people would prefer a removal, if the true state of their condition was properly made known to them.

It appears that another Council, called the Red Clay Council, was held some time previous to this one, at which removal was not advocated.—The Running Waters Council express their disapproval of the course there recommended, and order that a delegation be sent to Washington to represent the views and wishes to those who prefer to remove to a country where the Cherokees can be preserved as a distinct community. The Red Clay Council have also sent a delegation to Washington.

Elias Boudinot, in a letter, an extract from which is given in the Southern Recorder, writes: "The meeting will have a powerful effect. It seems already to have inspired a new energy in our people, who are determined to get out of the jurisdiction of the States."—[Baltimore American.]

WASHINGTON, JAN. 9.—A part of the delegation have arrived in this city, of the Cherokees, who were appointed by that portion of the nation who are favorable to the policy recommended by the President of the United States.

A committee of the House of Representatives of Massachusetts, have provided for the accommodation of the members six hundred and fifteen seats. It is ascertained that there are six hundred and three members elected.

The Regents of the University, at a meeting held on the 8th instant, appointed the Hon. STEPHEN VAN RENSSELAER, Chancellor of the University, in the place of Simeon De Witt, Esq. deceased.

When Wm. Penn first landed in Pennsylvania, he walked with the Indians, sat down with them on the ground, and ate with them roasted acorns and hominy; then they began to hop and jump, whereupon Wm. Penn stopped up and beat them all. Such wise complaisance won and secured their friendship and affection for him during his life.

**Ship Letters.**—There were received at the Post Office in this city during the last year 420,359 ship letters; 183,855 were for the city delivery, and the remaining 236,504, were forwarded to other offices.—[Times.]

Mrs. Bogue, of Amherst, on the 29 of Sept. last, the anniversary of her ninety-ninth year, spun sixty knots and thirty threads of handsome woollen yarn!

**Spermaceti Whale Fishery.**—The whole number of ships engaged in this valuable branch of the fisheries, is 273, of which 257 are now absent, viz:—From New Bedford 94, Nantucket 63, Fairhaven 14, Bristol 13, New London 10, Hudson 9, Warren 7, Edgartown 6, Falmouth 6, Newport 6, Sag Harbor 5, Salem 3, Newburyport 3, Poughkeepsie 2, Portsmouth 2, Dartmouth 2,

and 1 from each of the following ports, viz:—Boston, Plymouth, Wareham, Rochester, Portland, Wicasset, Fall River, Providence, Stonington, Newburg, New York, and Wilmington, Del.; 16 ships only are in port. The aggregate tonnage of the 257 absent ships, is nearly 100,000 tons. The number of seamen and navigators employed on board these vessels, is not far from 9,000. The cost of the entire fleet, as fitted for these voyages of three years' duration, probably exceeds \$6,000,000.

Among the ships now abroad, there are 31 which sailed in 1831, 73 in 1832, 88 in 1834, and 65 in 1834. Should no unforeseen calamity take place, whereby this important branch of national industry may be injured or interrupted, the number of spermaceti whale ships expected to arrive within the year 1835, may be set down at 70, and their cargoes at 125,000 barrels, valued at upwards of three millions of dollars.—[Nantucket Inquirer.]

The loss by the fire in Chatham street yesterday, is estimated at \$40,000, and the insurance at \$27,000. There is no apology for not insuring against fire, when the premiums as compared with the risk are so moderate.

**A Good Hit.**—A Mr. Gray inquired of a negro servant what color he believed the devil was; "Why," replied the African, "the white men tell us he is black. We say he is white. But from his long age, I guess old Nick must be gray."

"Chock home" is what the sailors say when a thing can go no farther; and this might be said of the weather here for two days past. The thermometer (Fahrenheit) has been at 39 or 40 below 0, and consequently the mercury congealed! —[Bangor Whig.]

[FOR THE NEW YORK AMERICAN.]

**American Antiquities.**—An interesting communication was read at the last meeting of the Lyceum of Natural History, from General Swift, in which he makes known the existence, and details some particulars of, another of the ancient cities of this continent. This discovery was recently made by Capt. J. C. Cunningham of Mexico, an enterprising and intelligent gentleman, while exploring "El Estero de Topila," one of the tributaries of the river Panuco, that empties into the Gulf of Mexico at the city of Tampico. The ruins are situate at the base of a mountain, about 55 miles from Tampico, and disclose the vestiges of a regularly-planned city, the buildings of which were of hewn stone, on streets about 30 feet in width, running at right angles, with curb-stones and side-walks: where open, they were found to be covered with a smooth layer of small pebbles. The buildings had in every observed instance fallen inwards, and on the mounds so formed, are now growing large forest trees. Captain Cunningham noticed an inscription in characters resembling the Greek; and some remarkable structures, one of which he supposed to have been a tomb, and another a temple: from the latter he brought, from among many similar rude sculptures, a curiously distorted human face and figure, carved in stone, which he has presented to the Lyceum of Natural History, and it is now in their Museum. Capt. Cunningham is about to return to Tampico, and intends a more minute and careful examination of these interesting remains, whence it is probable he may be able to draw materials that will importantly assist archeologists in their endeavors to throw some light on the origin, habits and state of civilization of the early inhabitants of this continent. The proximity of this ancient town to the much-frequented city of Tampico, will, it is hoped, induce others of our countrymen to engage in the same work of research.

The annexed record of the temperature, from the 2 to 10 inst. including the cold Sunday the 4th, is from the table of an accurate observer and establishes the maximum of cold experienced here, as not exceeding 4 deg. under zero—almost moderate to the 30 and 40 degrees of Columbia county and Albany.

Steamboats were so much in demand yesterday for towing vessels, that as high as thirty dollars an hour was paid. The common price is ten dollars an hour.

**MERCANTILE LIBRARY ASSOCIATION.**—A most overflowing attendance of the members of this Association was induced last evening at the Clinton Hall, by the recurrence of the Annual Election for Officers.

At a general meeting previous to the election, at which Mr. J. G. King presided, the Annual Report was read, giving a very satisfactory account of the condition of the Institution, &c.—A short Address was made by the Chairman, and speeches by Messrs. Stebbins, Buckingham, and others, when the general meeting was dissolved and the election was proceeded with.—It was warmly contested—there being two rival tickets—and resulted against what was called the regular nomination. We subjoin a list of the successful candidates; and the election being over, take leave to express the hope that the excitement which attended it, may also cease.

R. R. BOYD, President.

ANDREW MOUNT, Vice President.

J. JAMES HORN, Secretary.

JAMES ROACH, Treasurer.

R. J. ANDREWS, J. P. CROWKITE,

CHARLES ROLFE, S. T. NICOLL,

J. N. BRADLEY, GEORGE PORTER,

C. B. SANBORN, T. A. CUMMINS,  
Directors.

APPOINTMENTS BY THE PRESIDENT.

By and with the advice and consent of the Senate.

JAMES M. WAYNE, to be one of the Associate Justices of the Supreme Court of the United States, in the place of William Johnson, deceased.

BENJAMIN RENNshaw, to be Consul, for the port of Alicante, in Spain, in the place of George E. Adams.

JOHN STRYKER, to be Consul for the port of Gallio, (Texas,) in Mexico.

WILLIAM H. WICKES, Surveyor and Inspector of the Revenue for the port of Chester, in the State of Maryland, from the 5th inst., when his former commission expired.

EDWARD PESCUD, Surveyor and Inspector of the revenue for the port of Petersburg and City Point, in the State of Virginia, from the 12th inst. when his former commission expired.

SAMUEL ALEXANDER, Register of the Land Office for the district of land subject to sale at Quincy, in the State of Illinois, from the 2d of March next, when his present commission will expire.

FRANK J. ALLEN, Register of the Land Office for the district of lands subject to sale at Jackson, in the State of Missouri, from the 24th December, 1834, vice George Bullitt, Esq., deceased.

WILLIAM BLACKBURN, Receiver of Public monies for the district of lands subject to sale at Wapakoneta, in the State of Ohio, from the 21st Dec. ult., vice R. J. Skinner.

THOMAS J. CHARLETON, Collector of the Customs for the district and Inspector of the Revenue for the port of Hardwicke, in the State of Georgia, from the 30th ult., vice J. J. Maxwell.

**TEMPERANCE MEETING OF MECHANICS.**—We were led by the call of a public meeting, published in the papers, and numerous signed by some of our most respectable mechanics, to look in at Chatham-street Chapel last evening, and we know not when and where we have seen a more gratifying spectacle, than was afforded by the gathering there, in such a cause, of more than 2000 persons, most of whom were, we have little doubt, mechanics.

Gideon Lee opened the proceedings in an excellent address, was followed briefly by Mr. Mercier, and then by Mr. Hunt, of North Carolina, who, with an earnestness that denoted entire conviction, and with an archness and humor that enlivened, without rendering less impressive, the lesson he desired to inculcate, that intemperance is the bane of social and civil life—of industry, character and independence—kept alive the attention and interest of the audience for more than an hour. He concluded by reading the pledge to be signed by those who desired to join the Temperance Society, and then invited signatures.—Papers were immediately circulated throughout the Hall, and, as we heard, more than 500 signatures were obtained. We hope the ball will be kept in motion.

**ANOTHER STEAMBOAT BURNT.**—We are indebted to the editor of the Columbus Sentinel for the following disastrous information.—“Since our paper (of Jan. 3) went to press, we learn that the splendid new steamboat, *Eloisa*, (built at Pittsburgh, under the superintendence of Col. D. J. Britt, who was a part owner, and intended to ply between this and Apalachicola,) loaded with Cotton, was entirely consumed by fire on the night of the 31st ult. at Brown's Ferry, on the Chattahoochee. We understand that the disaster was the result of accident.”

“Why did Adam bite the apple?” said a school-master to a country boy. “Because he had no knife to cut it,” said the boy.

It is to be regretted that the taste for music is not more prevalent in this country. It has a humanizing and gentle influence upon the character of a people, and affords a source of refined and innocent delight which nothing else can supply. A taste for music encourages all the social virtues; it furnishes an amusement which delights without danger, and affords instead of the dull and eating pleasures of dissipation, a source of delight as refined as it is endless. The ladies are particularly interested in this matter.—“When a taste for music becomes more general in the other sex, they may depend not only on having more of their company, but having that company rendered more agreeable by the charms of gentleness, refinement and harmony.

There is a destiny hangs over us: we are not entirely our own masters, and cannot carve for ourselves. It is cruel to lay, in every case, a man's non-success at his door. There are often circumstances, not at his command to which almost any other would have been a victim. They who are at their ease, and have never been put into peril, may talk very calmly, and very sentimentally; or may shake their heads with a hypocritical appearance of regret, when they are secretly exulting in their hard hearts.

By THE WILLIAM GIBSONS, steamboat from Charleston, we have papers of Saturday evening last. The cold weather had continued there, with snow—and the thermometer at 18 deg.

For accounts of the Cotton market, we refer to the Commercial Record. There had been few arrivals at Charleston—there were on the 9th.—British brig *Burton* from Liverpool and the brig *Durant* from Boston—on the 10th there was no arrival—the packet ship *Anson* cleared for this port.

[From the Courier & Enquirer.]  
**TRIAL OF MATHIAS, THE PROPHET.**  
*For the Murder of Mr. Elisha Pearson,*  
WHITE PLAINS, WESTCHESTER CO.  
Wednesday, Jan. 14, 1834.

A Special Court of Oyer and Terminer for this county, assembled on Monday, and was thronged to a degree quite unexampled on any previous occasion. There were several important causes, both civil and criminal, to be brought before it, but the interest of these seemed wholly lost in the intense curiosity excited by the astonishing case of this man. During the first two days it seemed to be the prevalent opinion that the Grand Jury would not find the indictment against him, in consequence, it was said, of the absence of several important witnesses for the prosecution. Last night, however, it was generally rumored that the bill had been found; and at 10 o'clock this morning all doubts were removed by the entrance of the Jury with a bill of indictment against “Robert Matthews, otherwise called Mathias the Prophet,” for the murder of Elisha Pearson, late of Mount Pleasant, in the county of Westchester. The Court immediately suspended the other business before them and ordered the prisoner to be brought up. He took his seat in the criminal box with a hurried, and, for him, unusually embarrassed air. He exhibited his favorite modicum of beard, and his hair, which appears somewhat more grey than when we last saw him, was also in much greater length and profusion. The expression of his countenance was careworn and anxious, and he seemed impressed with a reflection, that the present occasion was neither to be held in defiance nor treated with contempt. His dress was a green frock coat adorned with frog buttons, lined at the skirts with a pink and pea-green plaid silk; a green fancy silk vest, rather greasy, and stone-drab colored pantaloons.

Mr. Nelson, the District Attorney, then called upon him to hear the indictment, which set forth his alleged crime in five several counts—the first charging him with having caused the death of Mr. Pearson by mingling arsenic with his food between the 1st and the 6th of August, 1834; the second charging him with the murder by means of some metallic substance thus mingled which was unknown to the Jury; the third, with having thus poisoned him with the aid of an accessory unknown to the Jury; the fourth with having killed him by starvation whilst keeping him in duress and confinement in his own house; and the fifth with having caused his death by withholding from him whilst thus confined and suffering from a grievous illness such nursing and medical attention as were needful to his recovery. Whilst listening to the part of the first count which technically set forth that the poison had “entered the body” of the deceased, the prisoner's features acquired a slight expression of ridicule, but during the reading of the all the remaining counts, he preserved an unbroken gravity, slightly inclining his ear as if to hear every syllable distinctly, and erecting at regular intervals the tremendous beard on his upper lip in a manner which at a less solemn juncture could not have been witnessed without laughter. Still neither in this nor in any other peculiarity of demeanour, could we perceive any of the usual indicia or concomitants of insanity. The moment the indictment was read, Mr. Western of New York, the prisoner's leading counsel, rose and said, “If the Court please, before we plead to this indictment, it will become my unpleasant duty to state some facts connected with the manner in which it has been found, that are, in my opinion, vitally important both to the forms of justice and to the interests of my client. I find that it has been framed under an undue influence, in consequence of the illegal access to the jury of an individual who was neither a witness, nor the District Attorney, who is alone authorized to hold intercourse with them during their solemn and responsible deliberations. In proof of this I beg to submit to the Court the following affidavit, and on which I shall move that the indictment be quashed.

“N. Nye Hall [who was the Associate Counsel of Mr. Western,] being duly sworn, saith, that he has been informed, and believes, that a person who is neither a witness, nor the District

Attorney for the County of Westchester, has had access and communication with the Grand Jury, who found the bill of indictment against Robert Matthews, during the present term of the Court of Oyer and Terminer, for the aforesaid County, and that such communication was on the subject of said indictment. Deponent further saith, that the said person so having the said access is R. R. Voris, Esq. of Westchester, who in a conversation in deponent's presence, stated that the said Matthews was a great villain, or words to that effect, and that he deserved to be severely punished, or words to that import—Sworn, &c.”

This affidavit seemed to produce a great sensation in the Court, but Judge Ruggles after a short conference with his Associate Judges, refused the motion of counsel, which had been supported by an energetic address, and merely stated that “the Court do not see any sufficient reasons for quashing the indictment,” and took the counsel's exception. Mr. Voris, who is a highly respectable counsellor of Sing-Sing and who seems had acted in the Grand Jury Room as an Assistant District Attorney during the necessary attendance of Mr. Nelson in Court, rose and said, “he trusted that whatever little character he may have acquired in the country would be deemed by the Court quite sufficient to repel the accusation of such an affidavit, from such a source.” On which Mr. Hall rose and said, with great warmth of manner, “And I also trust that the opinion of the Court will not be affected by such a remark from such a source,” or in words to that effect.

The District Attorney then states to the Court that for want of material witnesses to the prosecution of the cause, who were absent from illness, he wished it to be postponed to the next term of the Court. This was warmly opposed by Mr. Western, who required that the public prosecutor should make an affidavit of the fact embodying the name of the absent witnesses in order that he might put his finger upon them in case he should find it necessary to do so. Mr. Nelson replied he did not know upon what principle the gentleman could demand an affidavit from him, but he would follow the courtesy practised on such occasions, and state the names of the witnesses, which were Mrs. Folger, Dr. Condit, Jr., Dr. Jones, Dr. Canfield, and Catharine Gallaway.—And in addition to the reasons for postponement arising from the absence of these witnesses, it had become necessary, in anticipation of the plea of insanity which he had learned was to be set up by the prisoner's counsel, to secure the attendance of persons who had known the accused for many years.

After some further discussion the Court decided to adjourn the cause to the next term, which will be April next, when, if we may judge from private information of high authority a development of facts will be made more extraordinary than any yet recorded in the annals of imposition and delusion.

The London Courier, of the 11th of last month gives the following paragraph:

“There are in the United States, says a New York paper, 300,000 drunkards. Suppose they were all to die to day, and to be buried side by side in one continued line, allowing three feet for the width of each grave, and three feet between them—the line of graves would extend 3499 miles! Were they to be buried in one grave yard, they would cover an area of 680 acres, and a fence to enclose it would be more than four miles in circuit. War has its horrors—famine has its horrors—pestilence has its horrors—but the horrors of intemperance concentrate and exceed them all. In ten years' time the whole procession will have passed, and the grave yard will be filled. How long shall it be so? Will an end never come?”

**Fire.**—About half past two o'clock this morning, a fire broke out in a wooden building, in the rear of Amos street, the property of Mr Isaac Ammerman, and tenanted, and used as a dye-house by Mr. James Melville. It was considerably injured, and a quantity of yarn and dye stuffs destroyed; but the fire was extinguished before it reached any of the adjoining buildings.—[Jour. of Com.]

## FOREIGN INTELLIGENCE.

**LATER FROM EUROPE.**—Another arrival—the South America from Liverpool, in a passage, for the season of the year, most unusual—brings London dates to the 16th ult.

The South America arrived off the Hook Saturday, and sailed on the 17th December, making the passage from port to port in 23 days.

The new English Administration is formed. Sir Robert Peel as Premier; and without any admixture, as will be seen, of Reformers.

Application was, it is said, made, but without success, both to Lord Stanley and Sir James Graham, to join the administration, whence the inference seems reasonable, that no such assurance was given of the future march of the Cabinet, even in the circumscribed path of reform, which those gentlemen have followed, as would justify their taking office.

The dates from Paris are of the 13th. The Chambers, as we stated in commenting on the news by the Sylvie de Grasse would be the case, did not meet between the 8th and 13th. On the 13th, Saturday, nothing specific was done, and nothing at all on our subject; so that up to Monday, 15th Dec., no mention appears to have been made of the American treaty.

In Spain, *Mina's* name and services do not appear to have produced as yet any confidence in, or good result to, the Queen's cause, nor to have in any manner dispirited the Carlists.

The packet ship *United States*, Holdridge master, in coming out of the dock, was run ashore by the pilot, and was obliged to be discharged, having, however, only slightly damaged her cargo. She would soon be ready again for sea.

## ENGLAND.

LONDON, Dec. 11.—The King held a Privy Council yesterday, which was attended by the Lord Chancellor, (Lyndhurst) the Duke of Wellington, Marquess of Camden, Earls of Roslyn, Amhurst, and Jersey, Lords Ellenborough, Cowley, and Maryborough, Sir R. Peel, Sir C. M. Sutton, Sir John Becket, Sir H. Hardinge, Messrs. Goulburn and Herries—our future Reformers.

Sir R. Peel was sworn into office as Chancellor of the Exchequer, and received the seals of office from the King. He will also be first Lord of the Treasury; but with respect to the latter some delay must take place.

Parliament was ordered to be further prorogued from the 18th of the present month to Thursday, the 15th of January. But this is a mere matter of form, as Parliament can be dissolved at any time. Nothing, however, is yet known of the dissolution, though it is probable that the moment the ministerial arrangements are completed it will take place.

[From the London Globe, Dec. 15—evening.]

**The New British Ministry.**—The following is a correct list of the new Cabinet Ministers appointed at the Council held this afternoon at St. James's Palace:

Sir R. Peel, First Lord of the Treasury and Chancellor of the Exchequer.

Lord Lyndhurst, Lord Chancellor

Duke of Wellington, Foreign Secretary.

Lord Wharfedale, Privy Seal.

Earl of Aberdeen, First Lord of the Admiralty.

Lord Rosslyn, President of the Council.

Mr. Goulburn, Secretary for the Home Department.

Mr. Herries, Secretary of War.

Sir Henry Hardinge, Secretary of Ireland.

Sir G. Murray, Master-General of the Ordnance.

Mr. A. Baring, President of the Board of Trade.

Sir L. Knatchbull, Paymaster of the Forces.

Lord Ellenborough, President of the Board of Control.

The above form the Cabinet.

The Secretaryship for the Colonies, and the Chancellorship for the Duchy of Lancaster, are not yet filled up.

The following appointments have been made: Sir J. Searlet, Chief Baron of the Exchequer. Sir E. Sugden, Chancellor of Ireland. Lord Jersey, Lord Chamberlain.

**Lord Stanley.**—No doubt the refusal of Lord Stanley to take office will be fastened on by the men of the crisis as a proof that the country is on the eve of great disasters. We have the satisfaction of being enabled to calm their raptures, by an assurance that Lord Stanley, though declining to take office for the present, has unequivocally asserted that he will support the King and the Ministers of his choice.—[West Kent Guardian.]

**Ghent, Dec. 13.**—Our arrivals from Germany mention that a marriage had been determined on between her Royal Highness the Princess Victoria, presumptive heiress of the throne of Great Britain, and his Royal Highness Prince William Alexander Constantine, the second son of his Royal Highness the Prince of Orange. This alliance would be the prelude of the most intimate and friendly relations between the Netherlands and England. It would enhance, if possible, the splendor of the House of Brandenburg and the imperial family of Russia.—[Messenger de Gand.]

## FRANCE.

PARIS, Dec. 12.—M. de Broglie is definitely appointed Ambassador to London. Nothing is waiting for to make this nomination official, but to know the ministerial arrangements of the English Cabinet.

It was said on 'Change, that the Chamber intended to apply to the National the maximum of the penalty, viz: five years imprisonment and a fine of 30,000 francs. This may be the wish of some fanatic, such as we sometimes meet with, but we find it difficult to believe that the Chamber of Peers can have so far engaged itself that it can be announced beforehand that it will condemn, and to what penalty it will condemn.

The Paris paper (the Constitutionnel) states that "Prince Talleyrand speaks of a letter which he has received from the Duke of Wellington, inviting him to return to London, and assuring him that no alteration would be made in the foreign relations of the country."

The principle topic of reflection at present in the Paris papers is the citation of the editor of the National before the Chamber of Peers, for publishing in his journal an article derogatory to the dignity of that body. In pursuance of this summons M. Rouen, the respectable editor of the National, presented himself at the bar of the Chamber of Peers on Friday last, and on his application a delay of four days was allowed him for the purpose of preparing his defence.

At the sitting of the Court of Assizes yesterday M. Bichot, editor of the Tribune, was arraigned for a libel against the King, contained in an article published in that journal, entitled "*Du Voyage du Roi a Compiègne*," in which allusions were made to the events at Lyons, and to the unfortunate duel in which M. Dulon was killed.—M. Bichot was found guilty, and sentenced to 12 months imprisonment and a fine of 6,000 francs.

## SPAIN.

Postscript of the Journal de Paris, of Dec. 13: General Mina, on the 7th instant, proceeded to Lenz in order to protect a convoy of money expected there.

No new engagement has taken place. On the following day he returned to Pampeluna. Don Carlos was at Escuna on the 7th, when Zumalacarragay was directing his steps towards the Bidasoa.

PARIS, Dec. 12.—A courier from Cadiz brings us the intelligence that on the 13th, the anniversary of the Queen's birthday, the civil governor having objected to the singing of the patriotic songs by the actors, the spectators threw stones into his box, and they went to his palace, which they attacked; one of the domestics was wounded. At the departure of the courier the agitation had not ceased, and had spread to Xerxes de la Frontera.

**Compromise in Spain.**—The Memorial des Pyrenees of Pau says:—"It is affirmed that Zumalacarragay has written to General Mina, proposing, as a means of putting an end to the effusion of blood in the Peninsula, that a marriage should

be contracted between the young Queen and the son of Don Carlos; but Mina replied, that rebels must first lay down their arms. The war, therefore, is about to recommence with increased fury, and will become a war of extermination.

It is conjectured by the Times of the 16th ult. and by the Standard (which as a Tory paper may be supposed the more accurate now in such matters,) that Lord de Grey, better known as Lord Grantham, is to be the Vice Regent of Ireland, in the place of the Marquis Wellesley, who had quitted his government, as will be seen by the annexed.

**ARRIVAL OF THE LORD LIEUTENANT OF IRELAND.**—The Marquis and Marchioness Wellesley and suite arrived at the Clarendon hotel, New Bond street, on Friday evening, from the Vice-regal lodge, at Dublin Castle. The Firebrand Government steamer conveyed the Marquis and Marchioness, with their carriages and luggage, from Howth to Holyhead. Mr. and Mrs. Caton arrived at the Clarendon on the preceding evening, from Ireland.

The Rt. Hon. G. R. Dawson, brother-in-law of Mr. Peel, is to be the new Secretary for Ireland.

The Examiner thus speaks of Sir R. Peel.

Sir Robert Peel has answered to the Duke's whistle. He has hurried home and sprung into office with the speed of mischief. His politics turned with his coach wheels. Perish principles—welcome place! What are now his opinions? The opinions which he finds in the coat pocket of his official uniform.

Miraculous as was the Duke's conversion to Reform, that of Sir Robert must have been more sudden. He receives a note of invitation—it was but to ask and have—to govern or not to govern was then the short question—was he to stay at Rome with his principles, or to order post horses and dash home through thick and thin for the prize?—he was a Reformer in the crack of a whip. His professions were of no more concern to him than the cattle which speeded him on his journey—what mattered it whether he was drawn by a black, a white, or a piebald, so that he advanced to his goal? What cares he for the color of his opinions, so that they forward his fortunes? The journey to government was no more to be accomplished with his own principles than with his own horses, so he took hack-posters. And now here he is seated in the Treasury, First Lord and Chancellor of the Exchequer; what else he is to be, whether anti-reformer or sham-reformer, is doubtless to him immaterial—he will take the part which place makes convenient.

Madame Recamier has left the interest of 90,000fr. as an annual prize for the best treatise on the influence of grief as a cause of sickness and death. The prize is to be awarded by the Académie de Médecine. The unfortunate lady was herself for a long time a prey to wasting sorrows, under which she at length sunk. The consciousness of her approaching end, and of its cause, no doubt originated the idea of this singular bequest. *Journal Hebdomadaire*, Oct. 25. [The principal cause of the grief of this once beautiful and always amiable lady was the loss of her personal charms. She did not feel what everybody who knew her did—that age had not impaired her power of pleasing and interesting all who saw her.]

The Liverpool papers of 17th December, announce the arrival by the "England, from this port, of nine hundred and fifty chests tea." This is one of the fruits of abolishing the monopoly of the East India Company.

**Death of the Rev. Edward Irving.**—On the 6th instant, at Glasgow, between the hours of 11 and 12 o'clock at night, died in the 43d year of his age, the Rev. Edward Irving. He was sensible to the last, and his departing words were "In life or in death I am the Lord's;" previous to which, he sung the 23d psalm in Hebrew, accompanied by his wife's father, the Rev. John Martin.

## LEGISLATURE OF NEW YORK.

IN SENATE—Saturday.

The President announced the following.

STANDING COMMITTEES.

On Claims—Messrs. Sudam, Tracy, Fisk.

On Finance—Messrs. Van Schaick, Halsey, Beardsley.

On Judiciary—Messrs. Lansing, Edmonds, Edwards.

On Militia—Messrs. Maison, Kemble, Gansevoort.

On Canals—Messrs. Hubbard, Armstrong, Livingston.

On Railroads—Messrs. Edwards, Mack, Madison.

On roads and Bridges—Messrs. Seger, Willes, Jones.

On Literature—Messrs. Gansevoort, Bishop, Young.

On State Prison—Messrs. Macdonald, Beardsley, Lansing.

On Banks and Insurance Companies—Messrs. Edmonds, Armstrong, Stetson.

On Division of Towns and Counties—Messrs. Fisk, Mack, Beckwith.

On Agriculture—Messrs. Halsey, Cropsey, Griffin.

On Manufactures—Messrs. Bishop, Loomis, Downing.

On Privileges and Elections—Messrs. McDowell, Wills, Beckwith.

On Enrolled Bills—Messrs. Mack, Lawyer, Lacey.

On Indian Affairs—Messrs. Kemble, Loomis, Fox.

On Expiring Laws—Messrs. Tracy, Macdonald, Cropsey.

On Expenditures—Messrs. Stower, Griffin, Loomis.

On Incorporation of Cities and Villages—Messrs. Livingston, Seger, Beckwith.

Select Committees on Governor's Message.

On so much as relates to County Prisons—Messrs. Armstrong, Lacy, Edmonds.

To Police of County Poor Houses—Messrs. Kemble, Downing, McDowell.

To Instruction of the Blind—Messrs. Young, Livingston, Sudam.

To Asylum of the Insane Poor—Messrs. Beardsley, Gansevoort, Lansing.

Lotteries and the sale of Lottery Tickets—Messrs. Stower, Tracy, Van Schaick.

To an enumeration of the inhabitants—Messrs. Cropsey, Jones, Lawyer, Bishop, Seger, Hubbard, Halsey, Fox.

IN ASSEMBLY.

The Speaker announced the following

STANDING COMMITTEES.

Ways and Means—Messrs. Dayan, Cash, Pettit, Shafer, King.

On Grievances—Messrs. Adams, Hough, Brooks, Mallory, Moore.

On the Judiciary—Livingston, Roosevelt, M. H. Sibley, Krum, Dayan.

On expiring laws—Messrs. Stetson, Moseley, Warren, A. Hascall Kent.

On Claims—Messrs. M. H. Sibley, Burhans, Cuykendall, A. Woodworth, Benjamin.

On Colleges, Academies and Common Schools—Messrs. Wetmore, Burke, Clinch, Van Bergen, P. W. Paddock.

On Engrossed Bills—Messrs. Suffern, Beck, Plumb, Crowl, Niles.

On the Erection and Division of Towns and Counties—Messrs. Palmer, Griswold, Harvey, Ingersoll, W. Woodworth.

On the Incorporation of Cities and Villages—Messrs. Jackson, Ringgold, Tillinghurst, Tomlinson Wylie.

On Agriculture—Messrs. Healey, Becher, Conklin, Cray, Horton.

On the Incorporation of Charitable and Religious Societies—Messrs. Thorn, Coe, Wheeler, T. Lewis, Bennet.

On the Incorporation and alteration of the Charters of Banking and Insurance Companies—Messrs. Wilkinson, Adams, Davis, Van Benthuyzen, Dennison.

On the Petitions of Aliens—Messrs. Patterson, J. Clark, Philo, Tyrrell, E. Strong.

On the establishment of Roads, Bridges, &amp;c.—Messrs. Anthony, Phillips, G. Strong, Hicks, Blatchly.

On Canals—Messrs. Wager, Baker, A. Clark, Crain, W. S. Paddock.

On Railroads—Messrs. Roosevelt, Ogden, Preston, Eldred, Hutchingson.

On States Prisons and the Penitentiary system—Messrs. Stevens, Crosby, Groom, Cadwell, J. W. Lewis.

On the Militia and the Public Defence—Messrs. Lockwood, Fisher, Crain, Stetson, Wetmore.

On Indian Affairs—Messrs. Moseley, Lytle, Jones, Barnum, McKie.

On the manufacture of Salt—Messrs. Parker, Seger, Barnes, A. Brown, Hillyer.

On Medical Societies—Messrs. Judd, Rice, Williams, Murphy, Waldron.

On two thirds bills—Messrs. Gray, Hertell, Barr, Suffern, Wager.

On Public Lands—Messrs. King, Woodbury, Odell, Powers, Hildreth.

On Trade and Manufactures—Messrs. Quackenbush, Springer, Hiller, Woodward, McClure.

Select Committee on the Governor's Message.

On so much as relates to State Prisons—Messrs. Carr, Burhans, Griswold, Loomis, C. Clark, Williams, Wilkinson, D. Sibley.

On so much as relates to Poor Houses—Messrs. Ostrom, Simmons, Farwell, Richmond, Hendee.

On so much as relates to Insane Poor—Messrs. Hertell, Ogden, Van Bergen, Beecher, Tillinghast, Woodbury, Coe, Plumb.

On so much as relates to the Blind—Messrs. Cash, J. Haskell, Livingston, Moore, Gray, Carpenter, Cuykendall, G. Brown.

## WEEKLY REPORT OF DEATHS.

The City Inspector reports the death of 175 persons for the week ending on Saturday last, of whom 40 were men, 33 women, 59 boys, 43 girls—of the following

DISEASES.—Asphyxia 1; burned or scalded 6; casualty 2; convulsions 14; consumption 34; contusion 1; cramp 1; the stomach 1; dropsy 2; dropsy in the head 5; fever, 1; fever, bilious 1; fever, remittent 1; fever, scarlet 5; fever, typhus 3; flux infantile 1; gravel 1; hives or croup 9; inflammation of the bowels 3; of the brain 4; of the chest 4; of the liver 1; intemperance 7; marasmus 4; old age 6; palsy 2; peripneumony 18; rheumatism 2; small-pox 14; sprue 1; stillborn 19; suicide 2; tabes mesenterica 1; teething 3; whooping-cough 2; worms 2.

Of whom 64 were of the age of one year and under; 11 between 1 and 2; 18 between 2 and 5; 6 between 5 and 10; 5 between 10 and 20; 30 between 20 and 30; 18 between 30 and 40; 10 between 40 and 50; 12 between 50 and 60; 5 between 60 and 70; 4 between 70 and 80; 2 between 80 and 90.

GERRET FORBES, City Inspector.

Of the above, 19 were colored persons.

## SALES OF REAL ESTATE AT AUCTION.

By James Bleeker &amp; Sons—January 10.

The vacant lot on the corner of Bleeker and Charles streets, 25 by 75 feet 8300  
 The three lots adjoining with same building, being 70 feet on Bleeker and 75 on Charles st. 8300  
 The house and lot No. 118 Franklin street, between Chapel and Church sts. lot 90 by 50 feet 355  
 The lot on East Broadway, next the corner of Montgomery street, running to Division street, with a two story house, being 275 Division street, lot 25 by 165 6650  
 The lot on the corner of Liberty and Greenwich streets, being about 45 feet on Liberty, and about 64 feet on Greenwich street 13,000  
 The lot No. 30 Gold street, about 27 feet front, 20 in the rear, and 89 deep 10,000  
 One lot on the corner of State and Nevins street, Brooklyn, 25 by 100 625  
 Four lots adjoining the above at 675 3,000  
 One lot on the opposite corner 900  
 Eight lots adjoining the above at 700 5800  
 One lot on the corner of Avenue C and 4th st., 24 by about 100 1500  
 Three lots adjoining the same at 1360 3660  
 Six lots off 7th st., near 3d Avenue, each 800 4900  
 Seven lots adjoining the above, each 650 4350  
 The three story brick house No. 31 Beekman, between Nassau and William sts., 23 1-2 by 100 ft 13,500  
 The two story brick house and lot No. 11 Hague street, lot about 16 by 26 3550  
 The 2 story brick front house, adjoining the above No. 9, about the same dimensions 3100  
 The lot adjoining the last, partly in the rear, with a two story front house 3780  
 The three story brick house and lot 546 Broadway, lot 20 by 100 feet 7290  
 The 3 story brick house and lot No. 54 Broadway, lot 20 by 100 feet 1400  
 The three story house and lot adjoining the same 9500  
 The three houses and lots on E. corner of the Bowery and Grand street, 50 feet front on Bowery and 75 on Grand 26,000  
 The lot No. 4 Front street, running to Water st. being No. 2 Water street, being 31 1/2 ft. on Front 14,500  
 25 on Water, and 137 feet in depth

## THE EXILE.

Amidst Siberia's mountains,  
 Dark glens and ice plains dreary,  
 Dull mists and frozen fountains,  
 An Exile worn and weary  
 Pined 'neath the galling chain  
 Of Muscovy's creation;  
 Then wildly asked if hope were vain  
 From ev'ry Christian nation.  
 "I sought not battle, loved not strife,  
 "But bless'd my homely board,  
 "Till forced to save, or lose my life,  
 "I snatch'd the desperate sword.  
 "The horde of Russian spoilers swept,  
 "Whilst Raptine led their van;  
 "My infants shriek'd their mother wept—  
 "Must I not feel as man!  
 "Wife, babes, home, shelter, all destroy'd—  
 "Ah! what remained to me!  
 "Revenge,—revenge my arm employ'd,  
 "Till crush'd by tyranny.  
 "What cared I for the sanguine wave,  
 "Whilst Russian was the flood?  
 "But when I saw the Polish brave  
 "Immersed in Poland's blood.  
 "My head, my heart, my hand alike  
 "Grew savage in the field;  
 "Despair's dark dictates bade me strike,  
 "Grim horror held my shield.  
 "Oh, Poland! had thy martial train  
 "Been powerful as brave,  
 "Ne'er had the tyrant Russian chain  
 "Fetter'd a Polish slave!  
 "No fond one left to sigh farewell,  
 "Nor kind hand mine to chide,  
 "Oh, I was like the wild gazelle  
 "Within a tiger's grasp!  
 "Home, hope, and freedom lost to me,  
 "What charm could life contain?  
 "The darkest page of history  
 "Will show our conflict vain.  
 "Yes, Despotism has subdued  
 "All that he can subdue;  
 "But 'midst the wildest solitude  
 "The soul of freedom grew:  
 "Chains cannot gall the master mind,  
 "Though round the captive thrown,  
 "This, to the glory of mankind,  
 "Was shown at Marathon.  
 "More modern story bids us bless  
 "The Gideon's happy hand,  
 "When valour's daring met success,  
 "And freed his native land.  
 "Oh might the shade of gallant Tell  
 "Sarmatia's heart reclaim,  
 "And to some ruin'd Polish cell  
 "Call Glory from her to us!  
 "Although my sun may now be set,  
 "And broke for aye my sword,  
 "If in the lapse of ages yet  
 "My country be restored—  
 "If on her hills the free-born boy,  
 "If in her vales the song,  
 "If round her hearth the hallw'd joy,  
 "If to her altars throng,  
 "A graceful race to praise their God,  
 "In peace and freedom blest—  
 "I'd stretch me on Siberia's sod,  
 "And sink in dreamless rest.  
 "But if the fetters and the fate  
 "That Moscow's hand impose,  
 "Be destin'd long as Poland's date,  
 "And deep as Poland's woe,  
 "My soul had best no prescience keep,  
 "My sense pierce not the gloom;  
 "Despair might groan, but would not weep,  
 "O'er Poland's nameless tomb.  
 "Sunless and starless in hawes,  
 "Unseen, unthought, unwept,  
 "Leave her where cypress only grows,  
 "Where opens dark are kept!  
 "No, no! the Cadmus-harvest yet  
 "Will ripen on thy plains;  
 "And though proud Moscow may forget  
 "The captive and his chains,  
 "Time shall rekindle Poland's flame,  
 "My country yet shall be  
 "A nation bearing honour'd name—  
 "Brave, independent, free!"  
 Thus warm the hapless Exile's pray'r,  
 Thus deep his patriot sigh,  
 While hope illum'd his sunshin'd cheek,  
 And lit his tear-dim'd eye,  
 But now the chains are broken,  
 The spirit free to roam—  
 His sorrows all are spoken,  
 Kind death conducts him home!

## RAILROAD AND CANAL MAP.

HIS long promised Map is now ready for those who wish it. Its size is 24 by 40 inches. It is put up in a convenient pocket form, in morocco covers, and accompanied by over 70 pages of letter press, giving a concise description of, or reference to, each Road and Canal delineated on the Map. It will also be put up in *Marble Paper* covers, so as to be forwarded by mail to any part of the country; the postage of which, cannot exceed 44, and probably not 25 cents, to any part of the country.

Published at 35 Wall street, N. Y., by  
 A. L. 11  
 D. K. MINOR & J. E. CHALLIS.

JUST received, and for sale at the Agricultural Warehouse, 51 Barclay street, a number of Greene's Patent Hay and Straw Cutter. This Machine, for simplicity of construction, and ease and rapidity in working, is superior to any machine of the kind for sale in the Union. To Stock Farmers, and the proprietors of Livery Stables, it is invaluable, and would save its cost in a very few months' use.

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, JANUARY 24, 1835.

We are indebted to the Hon. G. HARD, Member of Congress, for a copy of the Report made by A. Stewart, Esq., of the committee appointed to ascertain the probable amount of tolls on the Chesapeake and Ohio canal when completed to Cumberland, from which we shall make liberal extracts at an early period.

**OVERLAND JOURNEY TO INDIA.**—In reply to our request for information relative to the state and progress of internal communication and improvements in the East, we have been politely furnished, by a subscriber, with several numbers of the ASIATIC JOURNAL, in which we find several interesting articles relative to the overland route from India to Europe, which we shall at an early day transfer to our columns.

We are grateful for such favors, and solicit from friends the privilege of looking at such of their foreign periodicals, that we do not receive, as will enrich our columns.

**BOSTON AND PROVIDENCE RAILROAD.**—The annual report of the Directors of this Corporation has been laid before the Legislature of Massachusetts and presents the following facts. During the past year, the graduation of the road bed has been completed from the depot at Boston to the Rhode Island line at India bridge, ex-

cepting sundry sections of the extent of about a mile and a quarter in all, which are expected to be completed on or before the first of May. A single track has been laid from the depot at Boston, for the distance of about twenty-one miles, excepting for a mile and a half in Canton, where the graduation is not yet completed; and there are also about four miles more of the rail laid in different places; making an aggregate length of rail already laid, of twenty-three miles and a half. Stone foundations have been prepared throughout the remaining distance, where the graduation is completed, wherever they were considered necessary. The requisite materials for the completion of the whole have been engaged, and the directors see nothing to prevent the opening of the road by the first of June. It is believed by the agent, that the expense of the whole road will not vary materially from the original estimate.

The directors have also caused a branch railroad to be completed, during the past year, from the Low Plain in Dedham to Dedham village, the distance being about two miles and a quarter.

The whole amount of expenditures during the past year, has been \$552,506 7, and of receipts \$526,139 98. Of the latter amount, \$516,560 have been received from the stockholders by virtue of assessment; \$5,084 74 from the transportation of passengers and goods, \$2,632 63 from the sale of materials; and \$862 61 from rents: the accounts being made up to the first day of the present month.

The new locomotive engine purchased for the use of the Lexington and Ohio Railroad Company, was brought up to town on Wednesday, and will, we understand, be put in operation on the road in the course of a week.

Since the railroad was opened to Frankfort, the passenger cars have been uniformly crowded both ways. Nothing is more common now than for a gentleman to take a morning ride to the seat of Government, spend several hours there in watching the movements of the Legislature, and return to Lexington again in the afternoon, without fatigue to himself, and with but a trifling call upon his purse. Heretofore, at this season of the year, the distance between Lexington and Frankfort has been considered a full day's journey on horseback, and the urgency of business alone could form a sufficient inducement to prevail

upon a citizen to undertake it. When the locomotive is put upon the road, a single hour will suffice to accomplish the same distance, so that time, space, and the worst of obstacles to winter travelling, mud, will all be overcome.—[Lexington, Ky., Gaz.]

**GENERAL KNOWLEDGE.**—Whatever may be thought of the following remarks of Sir William Temple in other respects, their justice in relation to the medical profession must be universally acknowledged. "It is certain, however," says this distinguished writer, "that the study of physic is not achieved in any eminent degree, without very great advancements in the sciences; so that whatever the profession is, the professors have been generally very much esteemed on that account, as well as of their own art, as the most learned men of their ages, and thereby shared with the two other great professions in those advantages most commonly valued, and most eagerly pursued; whereof the divines seem to have had the most honor, the lawyers the most money, and the physicians the most learning."

Hippocrates was profoundly skilled in natural knowledge, before he commenced the study of medicine; and it has become a common saying, that where the natural philosopher ends, the physician begins. The laws which regulate other material substances apply to the human body. Chemistry is all essential to a physician. "I do not hesitate to pronounce," said Fourcroy, "that modern chemistry has done more, in twenty years, for medicine, than all the united labors of preceding ages." The materia medica is supplied from the three kingdoms of nature. Without a knowledge of botany, mineralogy, and zoology, a physician cannot understand the medicines he prescribes, and as the nomenclature of his profession is derived from the learned languages, and principally from the Greek, he ought to be a classical scholar. In a word, he should have a general acquaintance with all the departments of human knowledge, in order to compose that learned man which is expected from an able and accomplished physician.—[Scientific Tracts.]

*On the Use of Locomotive Engines on Common Roads—in reply to Mr. G. Ralston.*

To the Editor of the Railroad Journal:

SIR,—On perusing No. 49, Vol. 3, of your Journal, my attention was attracted by a letter from your respectable correspondent, Mr. Ralston, on the use of locomotive engines on common roads. He appears to be satisfied that they may, under favorable circumstances, compete with animal power in England, but doubts whether they will answer as well in the United States. My purpose is to invite attention to the reasons given by Mr. R. for this conclusion, and to the means of obviating such objections as appear to be most formidable. The facts on which Mr. R. has founded his conclusion may be classed under two general heads: 1. The greater economy of steam power and machinery in England than in the United States, and the greater economy of animal power in the United States than in England; 2. The imperfect condition of our roads, compared with those of England. As to the first point, I would observe, that although the facts stated are no doubt true, yet it does not follow from them, that steam power is not cheaper than animal power in the United States. The difference is not so great as in England, but it is fully proved by experience, that steam power applied on a railroad is, if any, little more than half the expense of animal power. It may be further remarked, that the application of steam in propelling a locomotive on an iron rail, is subject to a peculiar disadvantage in comparison with animal power, which would not occur upon a common road. This arises from the slipping of the car wheels on ascents, before the engine has exerted her full power. To avert this great inconvenience, the weight of the engine must be increased to obtain sufficient adhesion; which additional weight requires an extra, and otherwise superfluous, force to propel it. It is conceded, I believe, that on the common road there is no want of adhesion, and hence lighter engines may be employed with decided advantage. These facts show, that the difference of expense between steam and animal power must be greater on common roads than on a railway; and whatever may be the advantages of that power on the railroad, we have an assurance of a still greater relative advantage on the common road. The first objection suggested by Mr. Ralston does not, therefore, as I think, sustain his doubt of the profitable substitution of steam for animal power on the common road in the United States. The next objection, founded on the imperfect condition of our roads, is altogether conclusive: no engineer, in his senses, would risk a locomotive engine upon the convex, uneven, and rough surface of our best turnpike roads. If, therefore, we would employ the locomotive off the railroad, it must not be on a common, but a proper road, made for, and restricted exclusively to, that purpose; which, I apprehend, could be better adapted to the locomotive than even the best roads in England, especially if the wheels of the locomotive are made very wide, and otherwise perfectly adapted for this use. Having explained the plan of such a road in No. 5, Vol. 3, of your Journal, I need not repeat the

explanation here, but would remark in addition, that the great difficulty of arranging the business on a railroad, so as to admit of its general use for vehicles of different owners, running at various speeds, threatens to become a permanent obstacle to its utility, and especially its popularity. A proper locomotive road, suited for the meeting and passing of trains every where, would compensate for a considerable diminution of the load now drawn on a railroad. The Columbia railroad in Pennsylvania, made by the State, has been opened for general use with double tracks, but the interruptions are so frequent, that the stages propelled by locomotives can only run 8 or 9 miles an hour. It has therefore been proposed by the State authorities, to manage the whole transportation by their agents, in order to regulate the times for starting, meeting, passing places, &c. But this indispensable measure is about to be strenuously opposed by the inhabitants on the borders. A hard gravel or stone road, graded for the purpose, and made wide enough for vehicles to pass or meet, would remove all necessity for this arrangement, and individuals or companies, as many as might choose to embark, could establish trains for travelling or freight, securing to the public all the benefits of the most active competition. Yours, &c.

J.

*Report on the Progress and Present State of our Knowledge of Hydraulics as a Branch of Engineering.* By GEORGE RENNIE, Esq., F. R. S., &c. &c. Part I. (Continued from page 21.)

Unappalled, however, by these difficulties, the Chevalier Buat, after perusing attentively M. Bossut's work, undertook to solve them by means of a theorem which appeared to him to be the key of the whole science of hydraulics. He considered that if water was in a perfect state of fluidity, and ran in a bed from which it experienced no resistance whatever, its motion would be constantly accelerated, like the motion of a heavy body descending an inclined plane—but as the velocity of a river is not accelerated *ad infinitum*, but arrives at a state of uniformity, it follows that there exists some obstacle which destroys the accelerating force, and prevents it from impressing upon the water a new degree of velocity. This obstacle must therefore be owing either to the viscosity of the water, or to the resistance it experiences against the bed of the river; from which Dubuat derives the following principle. That when water runs uniformly in any channel, the accelerating force which obliges it to run is equal to the sum of all the resistances which it experiences, whether arising from the viscosity of the water or the friction of its beds. Encouraged by this discovery, and by the application of its principles to the solution of a great many cases in practice, Dubuat was convinced that the motion of water in a conduit pipe was analogous to the uniform motion of a river, since in both cases gravity was the cause of motion, and the resistance of the channel or perimeter of the pipes the modifiers. He then availed himself of the experiments of Bossut on conduit pipes and artificial channels to explain his theory: the results of which investigations were published in the year 1779. M. Dubuat was, however, sensible that a theory of so much novelty, and at variance with the then received theory, required to be supported by experiments more numerous and direct than those formerly undertaken, as he was constrained to suppose that the friction of the

water did not depend upon the pressure, but on the surface and square of the velocity. Accordingly, he devoted three years to making experiments, and with ample funds and assistance provided by the French government, was enabled to publish his great work, entitled *Principes d'Hydraulique vérifiés par un grand nombre d'Experiences, faites par Ordre du Gouvernement*, 2 vols. 1786, (a third volume, entitled *Principes d'Hydraulique et Hydrodynamique*, appeared in 1816); in the first instance, by repeating and enlarging the scale of Bossut's experiments on pipes, (with water running in them,) of different inclinations or angles, of from 90° to 1/100th part of a right angle, and in channels of from 1/4 line in diameter to 7 and 8 square toises of surface, and subsequently to water running in open channels, in which he experienced great difficulties in rendering the motion uniform; but he was amply recompensed by the results he obtained on the diminution of the velocity of the different parts of a uniform current, and of the relation of the velocities at the surface and bottom, by which the water works its own channel, and by the knowledge of the resistances which different kinds of beds produce, such as clay, sand, and gravel; and varying the experiments on the effect of sluices, and the piers of bridges, &c., he was enabled to obtain a formula applicable to most cases in practice.\*

Thus let  $V$  = mean velocity per second, in inches;

$d$  = hydraulic mean depth, or quotient, which arises from dividing the area or section of the canal in square inches, by the perimeter of the part in contact with the water, in linear inches;

$s$  = the slope or declivity of the pipe, or the surface of the water;

$g$  = 16.087, the velocity in inches which a body acquires in falling one second of time;

$n$  = an abstract number, which was found by experiment to be equal to 243.7;

$$\sqrt{ng}(\sqrt{d-0.1})$$

Then  $v = \frac{\sqrt{ng}(\sqrt{d-0.1})}{\sqrt{s} - \log \sqrt{s} + 1.6} - 0.3(\sqrt{d-0.1})$

$$\sqrt{s} - \log \sqrt{s} + 1.6$$

Such are the objects of M. Dubuat's work. But his hypotheses are unfortunately founded upon assumptions which render the applications of his theory of little use. It is evident that the supposition of a constant and uniform velocity in rivers cannot hold: nevertheless, he has rendered great services to the science by the solution of many important questions relating to it; and although he has left on some points a vast field open to research, he is justly entitled to the merit of originality and accuracy.

Contemporary with Dubuat was M. Chezy, one of the most skilful engineers of his time: he was director of the Ecole des Ponts et Chaussées, and reported, conjointly with M. Perronet, on the Canal Yvette. He endeavored to assign, by experiment, the relation existing between the inclination, length, transverse section, and velocity of a canal. In the course of this investigation he obtained a very simple expression of the velocity, involving three different variable quantities, and capable, by means of a single experiment, of being applied to all currents whatever. He assimilates the resistance of the sides and bottom of the canal to known resistances, which follow the law

\* Edinburgh Encyclopedia, art. Hydrodynamica, by Brewster.

of the square of the velocity, and he obtains the following simple formula:

$v = \frac{\sqrt{g d}}{z s}$ , where  $g$  is = 16·067 feet, the heavy body after falling one second;  
 $d$  = hydraulic mean depth, equal to the area of the section divided by the perimeter of the part of the canal in contact with the water;  
 $s$  = the slope or declivity of the pipe;  
 $z$  = an abstract number, to be determined by experiment.

In the year 1784, M. Lespinasse published in the Memoirs of the Academy of Science at Toulouse two papers, containing some interesting observations on the expenditure of water through large orifices, and on the junction and separation of rivers. The author had performed the experiments contained in his last paper on the rivers Fresquel and Aude, and on that part of the canal of Languedoc below the Fresquel lock, towards its junction with that river.

As we before stated, M. Dubuat had classified with much sagacity his observations on the different kinds of resistance experienced in the motion of fluids, and which might have led him to express the sum of the resistances by a rational function of the velocity composed of two or three terms only. Yet the merit of this determination was reserved to M. Coulomb, who, in a beautiful paper, entitled "Experiences destinees a determiner la Coherence des Fluides et les Lois de leurs Resistances dans les Mouvements tres lents," proves, by reasoning and facts,

1st. That in extremely slow motions the part of the resistance is proportional to the square of the velocity;

2dly. That the resistance is not sensibly increased by increasing the height of the fluid above the resisting body;

3dly. That the resistance arises solely from the mutual cohesion of the fluid particles, and not from their adhesion to the body upon which they act;

4thly. That the resistance in clarified oil, at the temperature of 69° Fahrenheit, is to that of water as 17·5 : 1; a proportion which expresses the ratio of the mutual cohesion of the particles of oil to the mutual cohesion of the particles of water.

M. Coulomb concludes his experiments by ascertaining the resistance experienced by cylinders that move very slowly and perpendicularly to their axes, &c.

This eminent philosopher, who had applied the doctrine of tension with such distinguished success in investigating the phenomena of electricity and magnetism, entertained the idea of examining in a similar manner the resistance of fluids, contrary to the doctrines of resistance previously laid down. M. Coulomb proved, that in the resistance of fluids against solids, there was no constant quantity of sufficient magnitude to be detected; and that the pressure sustained by a moving body is represented by two terms, one which varies as the simple velocity, and the other with its square.

The apparatus with which these results were obtained consisted of discs of various sizes, which were fixed to the lower extremity of a brass wire, and were made to oscillate under a fluid by the force of tension of the wire. By observing the successive diminution of the oscillations, the law of resistance was easily found. The oscillations which were best suited to these experiments continued for twenty or thirty seconds, and the amplitude of the oscillation (that gave the most regular results) was between 450, the entire division of the disc, and 8 or 10 divisions from zero.

The first who had the happy idea of applying the law of Coulomb to the case of the velocities of water running in natural or artificial channels, was M. Girard, Ingenieur en Chef des Ponts et Chaussées, and Director of the works of the Canal l'Oureq at Paris.\*

He is the author of several papers on the theory of running waters, and of a valuable series of experiments on the motions of fluids in capillary tubes.

M. Coulomb had given a common coefficient to the two terms of his formula, representing the resistance of a fluid,—one proportional to the simple velocity, the other to the square of the velocity. M. Girard found that this identity of the co-efficients was applicable only to particular fluids under certain circumstances; and his conclusions were confirmed by the researches of M. Prony, derived from a great many experiments, which make the co-efficients not only different, but very inferior to the value of the motion of the filaments of the water contiguous to the side of the pipe.

The object of M. Girard's experiments was to determine this velocity; and this he has effected in a very satisfactory manner, by means of twelve hundred experiments, performed with a series of copper tubes, from 1·83 to 2·96 millimetres in diameter, and from 20 to 222 centimetres in length; from which it appeared, that when the velocity was expressed by 10, and the temperature was 0, centigrade, the velocity was increased four times when the temperature amounted to 85 degrees. When the length of the capillary tube was below that limit, a variation of temperature exercised very little influence upon the velocity of the issuing fluid, &c.

It was in this state of the science that M. Prony, (then having under his direction different projects for canals,) undertook to reduce the solution of many important problems on running water to the most strict and rigorous principles, at the same time capable of being applied with facility to practice.

For this purpose he selected fifty-one experiments which corresponded best on conduit pipes, and thirty-one on open conduits. Proceeding, therefore, on M. Girard's theory of the analogy between fluids and a system of corpuscular solids or material bodies, gravitating in a curvilinear channel of indefinite length, and occupying and abandoning successively the different parts of the length of channel, he was enabled to express the velocity of the water, whether it flows in pipes or in open conduits, by a simple formula, free of logarithms, and requiring merely the extraction of the square root.†

Thus  $v = -0·0469734 + \sqrt{0·0022065 + 3041·47 \times G}$ , which gives the velocity in metres: or, in English feet,

$v = -0·1541131 + \sqrt{0·023751 + 32806·6 \times G}$ .

When this formula is applied to pipes, we must take  $G = \frac{1}{2} D K$ , which is deduced from the equation  $K = \frac{H + Z}{L}$ . When

it is applied to canals, we must take  $G = \frac{R}{L}$ , which is deduced from the equation  $I = \frac{Z}{L}$ ,  $K$  being equal to the mean radius

of Dubuat on the hydraulic mean depth, and  $I$  equal to the sine of inclination in the pipe or canal. M. Prony has drawn up extensive tables, in which he has compared the

observed velocities with those which are calculated from the preceding formulae, and from those of Dubuat and Girard. In both cases the coincidence of the observed results with the formulæ is very remarkable, but particularly with the formulæ of M. Prony. But the great work of M. Prony is his *Nouvelle Architecture Hydraulique*, published in the year 1790. This able production is divided into five sections, viz. Statics, Dynamics, Hydrostatics, Hydrodynamics, and on the physical circumstances that influence the motion of machines. The chapter on hydrodynamics is particularly copious and explanatory of the motions of compressible and incompressible fluids in pipes and vessels, on the principle of the parallelism of the fluid filaments, and the efflux of water through different kinds of orifices made in vessels kept constantly full or permitted to empty themselves; he details the theory of the clepsydra, and the curves described by spouting fluids; and having noticed the different phenomena of the contraction of the fluid vein, and given an account of the experiments of Bossut, M. Prony deduces formulæ by which the results may be expressed with all the accuracy required in practice.

In treating of the impulse and resistance of fluids, M. Prony explains the theory of Don George Juan, which he finds conformable to the experiments of Steeaton, but to differ very materially from the previously received law of the product of the surfaces by the squares of the velocities, as established by the joint experiments of D'Alembert, Condorcet, and Bossut, in the year 1775. The concluding part of the fourth section is devoted to an examination of the theory of the equilibrium and motion of fluids according to Euler and D'Alembert; and by a rigorous investigation of the nature of the questions to be determined, the whole theory is reduced to two equations only, in narrow pipes, according to the theory of Euler, showing its approximation to the hypothesis of the parallelism of filaments.

The fifth and last section investigates the different circumstances, such as friction, adhesion, and rigidity, which influence the motion of machines.

A second volume, published in the year 1796, is devoted to the theory and practice of the steam-engine. Previously to the memoir of M. Prony, *Sur le Jaugeage des Eaux courantes*, in the year 1802, no attempt had been made to establish with certainty the correction to be applied to the theoretical expenditures of fluids through orifices and additional tubes. The phenomenon had been long noticed by Sir Isaac Newton, and illustrated by Michelotti by a magnificent series of experiments, which, although involving some intricacies, have certainly formed the ground-work of all the subsequent experiments upon this particular subject.

By the method of interpolation, M. Prony has succeeded in discovering a series of formulæ applicable to the expenditures of currents out of vertical and horizontal orifice, and to the contraction of the fluid vein; and in a subsequent work, entitled *Recherches sur le Mouvement des Eaux courantes*, he establishes the following formulæ for the mean velocities of rivers.

When  $V$  = velocity at the surface;

and  $U$  = mean velocity,

$U = 0·816458 V$ ,

which is about  $\frac{4}{5} V$ .

These velocities are determined by two methods. 1st. By a small water-wheel for the velocity at the surface, and the improved tube of Pitot for the velocities at different depths below the surface.

\* Essai sur le Mouvement des Eaux courantes: Paris: 1804. Recherches sur les Eaux publiques, &c. Devin general du Canal l'Oureq, &c.

† Memoires des Savans Etrangers, &c., 1815.

If  $h$  = the height of the water in the vertical tube above the level of the current, the velocity due to this height will be determined by the formulæ

$$V = \sqrt{2gh} = \sqrt{\frac{\text{metres}}{19.606}} h = 4.429 \sqrt{h}.$$

When water runs in channels, the inclination usually given amounts to between  $\frac{1}{100}$ th part of the length, which will give a velocity of nearly  $1\frac{1}{2}$  mile per hour, sufficient to allow the water to run freely in earth. We have seen the inclination very conveniently applied in cases of drainage at  $\frac{1}{100}$ th and  $\frac{1}{150}$ th, and some rivers are said to have  $\frac{1}{100}$ th only.

M. Prony gives the following formula from a great number of observations:

If  $U$  = mean velocity of the water in the canal,

$I$  = the inclination of the canal per metre,

$R$  = the relation of the area to the profile of its perimeter,

we shall have

$$U = -0.67 + \sqrt{0.005 + 3233. R. I};$$

and for conduit pipes,

calling  $U$  = the mean velocity,

$Z$  = the head of water in the inferior orifice of the pipe,

$L$  = the length of the pipe in metres,

$D$  = the diameter of the pipe,

we shall have,  $U = -$

$$0.0248829 + \sqrt{0.000619159 + 717.857 \frac{DZ}{L}};$$

or, where the velocity is small,

$$U = 26.79 \sqrt{\frac{DZ}{L}};$$

that is, the mean velocities approximate to a direct ratio compounded of the squares of the diameters and heads of water, and inversely as the square root of the length of the pipes: and by experiments made with great care, M. Prony has found that the formula,  $U = -$

$$0.0248829 + \sqrt{0.000619159 + 717.857 \frac{DZ}{L}};$$

scarcely differs more or less from experiments than  $\frac{1}{10}$  or  $\frac{1}{20}$ . The preceding formulæ suppose that the horizontal sections, both of the reservoir and the recipient, are great in relation to the transverse section of the pipe, and that the pipe is kept constantly full.\*

In comparing the formulæ given for open and close canals, M. Prony has remarked that these formulæ are not only similar, but the constants which enter into their composition are nearly the same, so that either of them may represent the two series of phenomena with sufficient exactness.

The following formula applies equally to open or close canals:

$$U = -0.0468734 + \sqrt{(0.0022065 + 3041.47 \frac{DZ}{L})};$$

But the most useful of the numerous formulæ given by M. Prony for open canals is the following:

Let  $g$  = the velocity of a body falling in one second,

$w$  = the area of the transverse section,

\* According to Mr. Jardine's experiments on the quantity of water delivered by the Coniston Main, from Coniston to Edinburgh, the following is a comparison:

	Soots Pints.
Actual delivery of Coniston Main.....	189.4
Ditto by Eytzelwein's formula.....	189.77
Ditto by Girard's formula.....	189.26
Ditto by Dubuat's formula.....	189.13
Ditto by Prony's simple formula.....	192.38
Ditto by Prony's tables.....	180.7

$p$  = the perimeter of that section,

$I$  = the inclination of the canal,

$Q$  = the constant volume of water through the section,

$U$  = the mean velocity of the water,

$R$  = the relation of the area to the perimeter of the section,

then, 1st,

$$0.000436 U + 0.003034 U^2 = g I R = g I \frac{w}{p};$$

$$2\text{dly, } U = \frac{Q}{w};$$

$$3\text{rdly, } R w^2 = 0.000444499 \cdot w \frac{Q}{I} -$$

$$0.000309314 \frac{Q^2}{I} = 0.$$

This last equation, containing the quantities

$$Q I w \text{ and } R = \frac{w}{p};$$

shows how to determine one of them, and, knowing the three others, we shall have the following equations:

$$4\text{thly, } p = \frac{g I w^2}{0.000436 Q w + 0.003034 Q^2};$$

5thly,

$$I = \frac{p (0.000444499 Q w + 0.00309314 Q^2)}{Q w};$$

$$6\text{thly, } w = 0.000436 \pm$$

$$\sqrt{\frac{[(0.000436)^2 + 4(0.003034) g R I] Q}{2 g R I}}.$$

These formulæ are, however, modified in rivers by circumstances, such as weeds, vessels, and other obstacles in the rivers; in which case M. Girard has conceived it necessary to introduce into the formulæ the co-efficient of correction = 1.7 as a multiplier of the perimeter, by which the equations will be,

$$p - 1.7 (0.000436 U + 0.003034 U^2) = g I w.$$

The preceding are among the principal researches of this distinguished philosopher.\*

In the year 1798, Professor Venturi of Modena published a very interesting memoir, entitled *Sur la Communication laterale du Mouvement des Fluides*. Sir Isaac Newton was well acquainted with this communication, having deduced from it the propagation of rotatory motion from the interior to the exterior of a whirlpool; and had affirmed that when motion is propagated in a fluid, and has passed beyond the aperture, the motion diverges from that opening, as from a centre, and is propagated in right lines towards the lateral parts. The simple and immediate application of this theorem cannot be made to a jet or aperture at the surface of still water. Circumstances enter into this case which transform the results of the principal into particular motions. It is nevertheless true, that the jet communicates its motion to the lateral parts without the orifice, but does not repel it in a radial divergency. M. Venturi illustrates his theory by experiments on the form and expenditure of fluid veins issuing from orifices, and shows how the velocity and expenditure are increased by the application of additional tubes; and that in descending cylindrical tubes, the upper ends of which possess the form of the contracted vein, the expense is such as corresponds with the height of the fluid above the inferior extremity of the tube. The ancients remarked that a descending tube applied to a reservoir increased the expenditure.† D'Alembert,

Euler, and Bernoulli, attributed it to the pressure of the atmosphere. Gravesend, Guglielmini, and others, sought for the cause of this augmentation in the weight of the atmosphere, and determined the velocity at the bottom of the tube to be the same as would arise from the whole height of the column, including the height of the reservoir. Guglielmini supposed that the pressure at the orifice below is the same for a state of motion as for that of rest, which is not true. In the experiments he made for that purpose, he paid no regard either to the diminution of expenditure produced by the irregularity of the inner surface of the tubes, or the augmentation occasioned by the form of the tubes themselves. But Venturi established the proposition upon the principle of vertical ascension combined with the pressure of the atmosphere, as follows:

1st. That in additional conical tubes the pressure of the atmosphere increases the expenditure in the proportion of the exterior section of the tube to the section of the contracted vein, whatever be the position of the tube.

2dly. That in cylindrical pipes the expenditure is less than through conical pipes, which diverge from the contracted vein, and have the same exterior diameter. This is illustrated by experiments with differently formed tubes, as compared with a plate orifice and a cylindrical tube, by which the ratios in point of time were found to 41", 31", and 27", showing the advantage of the conical tube.

3dly. That the expenditure may be still further increased, in the ratio of twenty-four to ten, by a certain form of tube,—a circumstance of which he supposes the Romans were well aware, as appears from their restricting the length of the pipes of conveyance from the public reservoirs to fifty feet; but it was not perceived that the law might be equally evaded by applying a conical frustum to the extremity of the tube.

M. Venturi then examines the causes of eddies in rivers; whence he deduces, from his experiments on tubes with enlarged parts, that every eddy destroys part of the moving force of the current of the river, of which the course is permanent and the sections of the bed unequal; that the water continues more elevated than it would have done if the whole river had been equally contracted to the dimensions of its smallest section, a consequence extremely important in the theory of rivers, as the retardation experienced by the water in rivers is not only due to the friction over the bed, but to eddies produced from the irregularities in the bed, and the flexures or windings of its course: a part of the current is thus employed to restore an equilibrium of motion, which the current itself continually deranges. As respects the contracted vein, it had been pretended by the Marquis de Lorgna\* that the contracted vein was nothing else but a continuation of the Newtonian cataract, and that the celerity of the fluid issuing from an orifice in a thin plate, is much less than that of a body which falls from the height of the charge. But Venturi proved that the contraction of the vein is incomparably greater than can be produced by the acceleration of gravity, even in descending streams: the contraction of the stream being 0.64, and the velocity nearly the same as that of a heavy body which may have fallen through the height of the charge. These experimental principles, which are in accordance with the results of Bossut, Michelotti, and Poleni, are strictly true in

\* *Recherches Physico-Mathematiques sur la Theorie des Eaux courantes*, par M. Prony.

† "Calix deversus amplius rapit."—[Frontinus de Aqueductibus.] See also the Pneumatics of Hero.

\* *Memoire della Societa Italiana*, vol. iv.

all cases where the orifice is small in proportion to the section of the reservoir, and when that orifice is made in a thin plate, and the internal afflux of the filaments is made in uniform manner round the orifice itself.

Venturi then shows the form and contraction of the fluid vein, by increased charges. His experiments with the cone are curious; it would have been greatly to be regretted that he had stopped short in his investigations, but for the more extensive researches of Bidone and Lesbros. M. Hachette, in opposition to the theory of Venturi, assigns, as a cause of the increase by additional tubes, the adhesion of the fluid to the sides of the tubes arising from capillary attraction.

(To be continued.)

[From the London Mechanics' Magazine.]  
*Mathematics and Mathematicians.*

SIR,—I have just read Mr. Cheverton's explanation on the subject of the claims of mathematical science, in answer to my two last short articles. His last explanation is truly worthy of his two preceding articles. When such assertions are called explanations, nothing in nature need remain unexplained. The most important parts of his communication may be easily refuted from some articles in the *Mechanics' Magazine*—written by whom, do you think, Mr. Editor?—why, by no less a person than Mr. Cheverton himself. So much, in the mean time, for his consistency.

Having shown, in my last communication, that had it not been for the discoveries of Euler on the refrangibility of light, (in opposition to the opinion of Newton,) the achromatic telescope might have to this day remained a mere speculation, it may not be out of place, before leaving this part of the subject, to mention the great improvements that have been made in these instruments by the late Fraunhofer, a German philosopher, eminently distinguished for his high scientific attainments and practical skill. He has constructed telescopes with the most perfect object lenses, and of nine times any former dimensions, the power and brilliancy of which surpass all former attempts.

One would be apt to fancy, from the account Mr. C. has given, (No. 572, p. 277, col. 2,) of the way in which the Eulers and Bernoullis amused themselves with their experiments on gyratory motion, *tractory curves*,\* (untractable curves would surely have been a better name for them), unmanageable equations, &c., that they were wasting their time for no useful purpose. He might, with equal propriety, have applied the same terms of ridicule to Sir I. Newton's experiments in finding the deflecting force of the moon, and many more; or to the experiments of Maskelyne, Hutton, and Cavendish, for ascertaining the mean density of the earth. Of course, all these things, according to the Chevertonian philosophy, are mere matters of moonshine. However, be that as it may, no country has done more justice to the mighty dis-

coveries of Euler than England has done. I shall select, for Mr. Cheverton's edification, a few testimonials in his favor, from the writings of some eminent English mathematicians.

"Euler," says Dr. Hutton, in his *Mathematical Dictionary*, "was one of the most extraordinary, and even prodigious, mathematical geniuses that the world ever produced," &c.

"The great cultivators of astronomy," says the late Professor Sir John Leslie, "are divided into two classes—accurate and inventive observers, and profound and original theorists." Of those illustrious men who, in the lapse of three thousand years, have devoted their labors to so noble a purpose, we may distinguish a few who have stood pre-eminently above their contemporaries, as observers, Hipparchus, Ptolemy, Tycho Brahe, Hevelius, Cassini, Flamsteed, La Caille, Bradley, Maskelyne, and Piazzi; and as theorists, Copernicus, Kepler, Newton, and, after some interval, Clairaut, D'Alembert, and Euler, and in our own times the associated names of La Grange and La Place."

Mr. Peter Barlow, of the Royal Military Academy, Woolwich, in his English translation of Euler's *Algebra*, after enumerating some of his wonderful improvements and discoveries in almost every branch of mathematical and physical science, thus concludes:

"Possessing a mind of such wonderful comprehension, and disposition so admirably formed to virtue and happiness, Euler found no difficulty in being a Christian; accordingly his faith was unfeigned, and his love was that of a pure and undefiled heart. The advocates for the truth of revealed religion, therefore, may rejoice to add to the bright catalogue which already claims a Bacon, a Newton, a Locke, and a Hale, the illustrious name of Euler."

"The character of Euler is an object so interesting, that it is difficult to prescribe a limit to reflections when they are once indulged; one is attracted by a sentiment of admiration that almost arises to the emotion of sublimity, and curiosity becomes eager to examine what talents, and qualities, and habits, belonged to a mind of such superior powers."

At the period of Sir I. Newton's decease, Euler had just reached his 20th year, and two years before he was hailed by Newton as a rising star of the first magnitude. The whole of his life was devoted to the benefit of mankind, and in the morning of the day on which he died, (Sept. 15, 1783,) he had been engaged in calculating the orbit of Herschel's planet, and the motion of aerostatic machines.

Mr. C. has associated the names of the Bernoullis with that of the illustrious Euler. The two elder Bernoullis first distinguished themselves by their labors in cultivating the higher calculus invented by Leibnitz; and this powerful analysis was afterwards brought to its present state of perfection by Euler and other continental mathematicians. The fluxionary analysis, invented by Newton, is now, even in England, almost extinct.

The long but bloodless war which agitated the scientific world, (the war of problems,) and the high and commanding position the Bernoullis took in that memorable contest, sufficiently demonstrates their great prowess. John Bernoulli, says Leslie, "spent a long life in extending, by the activity of his genius, every branch of mathematical and physical science. He corresponded with all the foreign societies, and the numerous prizes he bore away proved a source of income. His *Treatise on Seamanship* came out in 1714, and his *Dissertation on the elliptical figure of the planets* appeared in 1730. But his various philosophical papers were carefully collected into four quarto volumes, and published, in 1742, at Geneva and Lausanne. He died, full of years and of glory, on the 1st Jan., 1748."

From the flippancy way that Mr. Cheverton speaks of Kepler, one would be apt to imagine that he considered him only as a fifth or sixth rate astronomer. He allows, however, that he, (Kepler,) *did discover two laws of the planetary motion*, which bear his name. Two laws! Pray, does Mr. C. deny one of them? I thought every astronomer had admitted that he discovered *three laws*, and here they are:

Law 1. All the planets move round the sun, (or the satellites round their primary,) in such a manner, that a line drawn from a planet to the sun describes areas proportional to the time of motion.

Law 2. The orbits described by the planets round the sun, or the satellites round their primary, are ellipses, having the sun or primary planet in one focus.

Law 3. The squares of the periodic times of those bodies which revolve round a common centre, are proportional to the cubes of their mean distances from that centre.

Perhaps this last law of Kepler is rejected by Mr. C., as he may have discovered that it is not in accordance with his own theory on the motion of bodies in resisting mediums. I would recommend him to read the *Life and Discoveries of the great Kepler*, by the Rev. Dr. Small, of Dundee.

I have still, Mr. Editor, some other remarks to make on this subject; and if you will allow me to continue them, for at least one paper more, I will feel much obliged to you. In the mean time, I am, Mr. Editor, yours, with respect,

LEWIS FRIEND.

Basil, Sept. 15, 1834.

A NEW THRESHING MACHINE, which is worked by manual labor, instead of by horse power, has recently been introduced into this county from Norfolk, and found to possess all the advantages of the horse machine. It employs eight men, four of whom turn two windlasses, which supersede the horse wheel; it threshes the corn quite as clean as the old machines; and in substituting human labor for brute power, it obviates the powerful objection to which the former improvement was obnoxious, of diminishing the employment of a redundant population.—[*Stamford Mercury*.]

\* Perhaps Mr. C. will favor us with the equations of a few of the simplest of these strange curves.

**IMPORTANT IMPROVEMENT IN THE SEXTANT.**—Mr. D. Rowland, of London, has effected an important improvement in the sextant by a very simple yet ingenious contrivance. We had often heard Mr. Rowland's invention spoken of in terms of high commendation, but have had no opportunity of bearing testimony to the merits of his truly valuable sextant, until Thursday last, when he exhibited its powers at the Plymouth Institution, at the close of the lecture. It happened that the very evening on which Mr. H. Woolcombe (the President) had obligingly made arrangements for Mr. Rowland to explain his instrument to the society, Mr. Davies Gilbert, late President of the Royal Society, honored the Plymouth Institution with his presence. The conversation which took place on the subject of the "Double Sextant" was exceedingly interesting. Mr. Gilbert, some of the members of the institution, (particularly Mr. Walker, of the Dock Yard,) and several strangers, offered their opinions on its advantages, which we think may be summed-up generally under the following heads:

1st. The old sextant being limited to a range of 120, the lunar distances in the Nautical Almanac were only computed to that extent. Now, navigators know that lunar observations are of the utmost importance in long voyages by checking errors in chronometers; they consequently avail themselves of lunar observations, and prefer those taken by day, because the horizon is more distinctly seen, and the altitudes are more correctly taken, than by night. It will, therefore, be desirable to extend the distances in the Nautical Almanac, between the sun and moon, to 140 degrees.

2d. When an artificial horizon is used, no angle of altitude above 60 degrees could be taken with the old sextant; of course the latitude could not be found by a meridian altitude of the sun, if this altitude exceeded 60 degrees. By the new instrument, these difficulties vanish, since the meridian altitude of all the heavenly bodies may be taken by it when vertical and doubled by the artificial horizon.

3d. In addition to the above advantages may be added the following, namely, Since the sextant will possess a range of 240 degrees, it will of course span the visible hemisphere with the utmost ease. Now, if the dip be known, the refraction may be measured by the instrument at any place, and at any time. But this is not all: we know that our globe is not a perfect sphere, but of a spheroidal form; consequently tables for dip and terrestrial distance, if computed for a sphere, must be erroneous when applied to a spheroid. Dip for altitudes, or objects taken east or west, would differ for objects in a north or south direction; because meridians of longitude continued round the globe are elliptical, whereas parallels of latitude are a series of circles of unequal diameters. This being the case, it follows that the span of the visible hemisphere, in the direction of the earth's axis, will be different from

that taken in a transverse direction. Rowland's "double sextant" would measure this difference at once, and point out a dip for each latitude, and each direction, with regard to the poles. This improved instrument may be used for ascertaining the true figure of our earth, and may either prove or disprove its form, as deduced from measured acres of its surface, or from calculations made from data furnished by the pendulum.—[Plymouth (Eng.) paper.]

**MUSCI, OR MOSSES.**—There are about 40 genera, and 330 species of this class. They are called winter plants, and are found to cover mountains as high as perpetual snow. Growing in patches, they cover the most barren spots, and thus prepare the earth for other vegetation. When growing on trees, they protect them from the severity of the winter.

**FOOD CONSUMED BY A COW.**—Moubray states that the average annual consumption of a cow is from one to one and a half acres of grass, and from a ton to a ton and a half of hay.

**COMPARISON OF COTTON AND HEMP.**—Mr. Hammond: The following contrast of the hemp and cotton plants, in an agricultural point of view, seems to the writer to be correct; but he has reason to believe that a great deal of incredulity exists in relation to it, otherwise more interest would be taken in eliciting a discussion upon the subject, and diffusing among the farmers of Hamilton and other counties of this state, correct information in relation to the superior value of their hemp lands when turned towards the production of that article.

**Cotton.**—It is known that this plant, when young, is one of the most delicate, and very liable to be destroyed by disease, not only in its incipient state, but at maturity, by the rot, the rust, the caterpillar, the frost, and storms of wind and rain, as is now experienced from those which occurred in the months of September and October of the present year. It is known that the average crop of the cotton lands of the states of Mississippi and Louisiana does not exceed 400 lbs. of ginned cotton, or one bale to the acre of that weight; and to realize that quantity, the best seasons and the best cultivation by hand and horse hoeing are required; that, in addition, a great deal of hand labor is required to pick it out of the pods lock by lock, to gain a bale fit for the market. And the average price per pound for the last ten years has not much, if any, exceeded to the planter ten cents per pound. And lastly, it is known to be an exhauster of the land, from the necessity that exists that the plant be permitted to come to maturity, unless the seed are rotted and returned to the soil.

**Hemp.**—This is known to be a very hardy plant, and though it requires good land to produce the heaviest crops, does not require, after the first preparation of the soil and seeding, very much additional labor in the cultivation. It is known that if it is cut, (as it always should be,) before the seed are ripe, when the lint only is wanted for market, that it exhausts the land but very slightly—and if the improved machinery for breaking, and the recently invented "Hemp Cutter," are employed, it can be taken off the land, few rotted and broken, with as much despatch, and even more, than 1600 lbs. of cotton in the seed, (the quantity re-

quired to make a bale of 100 lbs.) can be packed, ginned, and baled. It is known that the average quantity of clean hemp per acre may be put down at 800 lbs. the maximum being 1000 lbs. and the minimum 600 lbs.; and that the average price of clean hemp for the last ten years at Maysville, Kentucky, has been \$5 and about 10 cents per 112 lbs. It results, then, if these data be correct, that if 1000 acres of land be cultivated in hemp, it will produce 800,000 lbs. of clean hemp, worth \$40,000, equal to the product of 1000 acres in cotton, producing a bale of 400 lbs., worth 10 cents per lb., or \$40 per acre!

Should such facts as these be suppressed? Yet we hear very little, comparatively speaking, of the value of our hemp lands, and much of the great value of the cotton crop, and the facility of cultivating it. Is it not because the latter is cultivated on large estates by the employment of large capitals belonging exclusively to a few individuals, whose crops, worth say from 10 to \$40,000 each, sounds larger; whereas, if divided among all those employed in producing them, would no longer show as they do when concentrated in a few individuals.

I will say nothing of the tobacco crop. I will leave the planters of that article in Boon and Campbell counties, in Kentucky, who have recently lost their crops by the frosts of September last, to contrast their labor and gains with those of the hemp grower of Mason county in that state, who is now selling his crop in that market and elsewhere, at \$5, and more, and no delay. To say nothing further, it is known that these counties are scarcely within the tobacco region, as Mr. McDuffie very correctly said of the sugar plant in Louisiana. *A Friend to Agricultural Improvement.*—[Cin. Daily Gazette.]

**FIRE FROM ASHES.**—Some time in the month of November, passing a neighbor's barn, we discovered the straw on the dung heap, which was heaped up against the barn, to be on fire. In a few minutes the building would have been in flames. The fire was occasioned by hot ashes thrown on the heap. The following spontaneous combustion from ashes is from a lecture on heat, by Prof. SMITH, formerly of New-Haven.

"Perhaps there are few people who are acquainted with the fact that ashes made by burning hard wood, such as ash, maple, &c., in a fire place, and taken up dry, are capable of producing spontaneous combustion, simply by receiving a degree of moisture, or by coming in contact with a wet board or stave, or being exposed to a very damp atmosphere. It is generally believed when fire is kindled by ashes, that it is caused by coal being put away with the ashes while on fire; but this is a mistake. The coals, if they were on fire, when buried in ashes, and excluded from atmospheric air, would soon be extinguished, or if they were not, they could not kindle fire with the atmospheric air excluded. The spontaneous combustion of ashes proceeds from a very different principle.

"Hard wood ashes, when they are first made, and while they are kept dry, contain a metal called potassium, which is the basis of potash. This metal is very combustible, and has so strong an affinity with attraction for oxygen, the supporter, and cause of combustion, that it takes oxygen from water, the moment that it touches it, and burns with a vivid flame, and the

product of this combustion is potash, that is, potassium saturated with oxygen, or what may be called the oxide of potassium. It should be noticed, too, that water is a compound of oxygen and hydrogen, and that when the potassium comes in contact with water, it takes the oxygen from it, and the hydrogen being set free increases the combustion. The simple explanation then is this: dry ashes, when first burnt, contain in them a metallic substance, which is highly inflammable, and which is set on fire by moisture. Quick lime and water produce heat sufficient, in some instances, to set wood on fire, but ashes and water produce a much more intense heat. In adding water to ashes there is a real combustion of the metal contained in the ashes; the metal being a combustible substance, requiring nothing but the oxygen of water to set it on fire."—[N. Y. Farmer.]

From the forthcoming number of the "Mechanics' Magazine and Register of Inventions and Improvements."

**COMPARATIVE VALUE OF FUEL.**—As a knowledge of the relative value of the various kinds of fuel in use cannot fail to be of interest to all, and of benefit to most of our readers, we do not hesitate to publish at length the following very valuable article from Porter's Chemistry of the Arts. The information contained therein, if properly applied to the every-day business of life, will amply repay each reader for his subscription to the Mechanics' Magazine—even if he has paid in advance. The table of the comparative value of the 64 different kinds of fuel should be frequently read by those who desire to use economy in obtaining their supply of fuel.

Whatever kind of fuel it may be considered best to employ, it is extremely desirable that it should be as dry as possible, otherwise a great part of the heat it contains will be lost in converting the water in the fuel into vapor, which of course escapes up the chimney without producing any useful effect.

Fuel is often unnecessarily exposed to the weather, or put in wet places; and the injurious effect of introducing damp into a close fire-place is never considered.

**Pit Coals.**—There is considerable difference between the pit coals; and it has perhaps been too little attended to by those who are the chief consumers of this expensive article. The subject has not even been studied with much attention, except so far as relates to the production of gas; and the facts that have been established by these researches are not very useful in other applications of fuel.

Caking coal, also called binding coal, croszling coal, is obtained in great abundance from the extensive coal-fields in Northumberland and Durham; and is that which is sold in the London market as Newcastle coal.

When heated, this coal breaks asunder into small pieces; and the heat being raised to a certain degree, the pieces cohere, and form a solid mass, from which property it is called caking-coal. It

lights easily, and burns with a lively yellow flame. It requires to be frequently stirred or broken up, particularly when it cakes very hard; but different varieties differ considerably in this property. Of the Newcastle coals, the best Wall's-End make a brilliant and pleasing fire, burn away quickly, and do not cake hard, hence it is preferred for heating rooms; but the Tanfield Moor burn slowly, cake very hard, and afford a strong and long-continued heat, and is used in furnaces and forges. The other varieties are of an intermediate character.

Caking coal gives out a great quantity of heat, and, with attention, burns a long time; consequently, where it can be procured at a reasonable price, it is commonly preferred.

From the trials of Mr. Watt, it appears that a bushel of Newcastle coals, which weigh, on an average, eighty-four pounds, will convert from eight to twelve cubic feet of water into steam, from the mean temperature of the atmosphere; and that a bushel of Swansea coal will produce an equal effect.

Dr. Black states to the effect, that 7 pounds .91 of the best Newcastle coal will convert one cubic foot of water into steam, capable of supporting the mean pressure of the atmosphere.

In some experiments tried by Messrs. Parkes, it appears, that by their improved method of constructing boilers, an effect was obtained, equivalent to converting one cubic foot of water into steam from the mean temperature, with 7 pounds .45 of coal, in the case where the greatest effect was produced; but at a mean, 8 pounds .15 of coal were necessary to produce the same effect; which is only one quarter of a pound less than the mean of Mr. Watt. From a mean of several experiments, Smeaton makes it require 11 pounds .4 of coal to produce the same effect; but the kind of coal is not described.

Mr. Tredgold found that after the brick-work, &c. of the boiler of a steam-engine was warmed, a little less than one pound of Wall's-End coals would make a cubic foot of water boil, from the mean temperature of fifty-two degrees. To produce the same effect with inferior coals, a stronger draught, and more time and attention, was necessary.

**Splint Coal**, or hard coal, called slaty cannel coal by Kirwan, is esteemed equally valuable, for many purposes, as the Newcastle caking coal. It is obtained near Glasgow, in Ayrshire, Scotland, and in several of the English and Welsh coal-fields.

A greater heat is necessary to make it kindle than is required for caking coal, and consequently it is not so well adapted for a small fire; but a large body of splint coal makes a strong and lasting fire. It does not produce so much flame, nor so much smoke, as caking coal, and does not agglutinate or bind together.

The splint coal of Scotland was considered by Smeaton to be equal to Newcastle coal for steam-engines.

**Cherry Coal**, or soft coal, constitutes, says Dr. Thomson, the greater part of

the upper seams of coal in the Glasgow coal-fields; and it is also abundant in Fifeshire. He considers the Staffordshire coal to be of the same species; and the Edinburgh as intermediate between it and splint coal.

It readily catches fire, and burns with a clear yellow flame, giving out much heat; and the flame continues till nearly the whole of the coal be consumed. It burns away more rapidly than either caking or splint coal, and leaves a white ash. For most purposes it is less economical. It is easily distinguished from caking coal, by its not melting or becoming soft when heated. It makes a more agreeable fire, and does not require to be stirred. It requires care and management in an open grate, even to burn the small fragments which are made in breaking up the pieces to a fit size for the fire. Hence the small coals are often mixed with clay and made into balls. When these balls are dry, they make an excellent addition to the fuel for an open fire, producing a very durable heat.

Mr. Watt states that one hundred weight of good Wednesbury coal will produce the same effect as one bushel of Newcastle coal.

**Wood.**—In some places wood is used for fuel; its effect in producing heat is found to depend considerably on its state of dryness. Several experiments, made by Count Rumford, show the effect of dry wood to be much greater than that of unseasoned. Unseasoned wood contains about one third of its weight of water. The kind of wood is also a cause of some difference; from the experiments of Count Rumford, lime-tree wood gives out most heat in burning.

With his improved boilers Count Rumford made 20 pounds .10 of ice-cold water boil with one pound of dry pine wood. The same weight of pine wood unseasoned, would produce less effect by one-seventh. Beech wood afforded much less heat than pine; for one pound of dry beech made 14 pounds .33 of ice-cold water boil. A cubic foot of dry beech weighs about forty-four pounds.

According to Rosombroni, wood produces heat enough in its combustion to evaporate twice its weight of water, or to prepare two-thirds of its weight of salt. Count Rumford's trials make the effect of wood about one-third more, which may fairly be attributed to his superior skill.

**Peat**, considered only as a fuel, may be divided into two kinds. The first is compact and heavy, of a brownish black color, and with scarcely any vestiges of its vegetable origin remaining. This is the best kind. When it is once lighted it preserves fire a long time.

The second kind is light and spongy, of a brown color, and seems to be a mass of dead plants and roots, which have undergone very little change; it inflames readily, and is quickly consumed.

Peat gives out an odor, while it is burning, which is disagreeable to those, who are not accustomed to it. It affords a mild and gentle heat; but is not a good kind of fuel for supplying furnaces for

boilers; it is much better adapted for fires. It is of various qualities: some burn quickly with a bright flame; others burn slowly, and, according to Clement and Desormes, afford one-fifth of the heat that would be given out by an equal weight of charcoal. This nearly coincides with the ratio given by Blavier and Miche.

The weight of a cubic foot varies from forty-four to seventy pounds; and the dense varieties afford about forty per cent. of charcoal; the other varieties nearly in proportion to their density.

**Charcoal.**—Mr. Dalton, by heating water, obtained a result equivalent to melting forty pounds of ice with one pound of charcoal. But Dr. Crawford's experiments give sixty-nine pounds of ice melted by one pound of charcoal. Lavoisier's give ninety-five pounds and a half; Clement and Desormes ninety-five pounds; and Hassenfratz's trials, on various kinds, give a mean of ninety-two pounds of ice melted by one of charcoal, his highest result being ninety-six pounds, and lowest one seventy-four pounds. Mr. Tredgold considers forty-seven pounds of ice melted by one pound of charcoal as the real average effect of that fuel. A cubic foot of charcoal weighs about fifteen pounds.

**Coke.**—Lavoisier makes the quantity of coal to be that of coke as 605 is to 552 when the same effect is produced; and in addition to this increased power of giving out heat, it must also be considered that coke gives out no smoke in burning, whence it should always be used in furnaces seated in towns, in order to prevent any annoyance to the neighbors.

The present prevalent use of gas, for lighting towns and even houses, has brought a considerable quantity of *gas coke* into the market, which does well enough for heating rooms, but is far inferior to the stifled coke in its heating power, so that smiths and iron foundries invariably use the latter kind, and when a great heat is required, the chemist should follow their example.

Coke has been tried against wood in Paris for warming the Opera-House. Fifty-eight pounds of coke, costing there about 1s. 3d., produced the same effect as 160 pounds of wood, costing there about 2s. 6d.

**Charred Peat.**—According to Messrs. Blavier and Miche it requires 1666 pounds of charred peat to produce the same effect as 740 pounds of common charcoal.

The charred peat, made by stifling, is superior, in its power of producing heat, to that made by distillation. Unfortunately the stifled charred peat is a kind of pyrophorus, which takes fire if it becomes accidentally wetted, or even in moist weather. In consequence of this property several accidents have happened by the rain finding its way into places where it is kept; it is on this account forbidden, by the laws of some countries, to be kept in towns.

Therefore the Dutch, who burn this fuel, not only in their houses, but even in pans under their feet while they are at church in winter, are in the habit of char-

ring it at home as it is wanted. It is first burnt in the kitchen, and when they find it is red hot quite through, they then take it off the fire, put it in a close earthen or copper pot, and cover it down with a wet woollen or linen cloth, and by the air being excluded the fire is soon extinguished, and when it is cold it will resemble charcoal, except being covered with white ashes, and will, if properly charred, burn with scarce any smoke, and very little of the suffocating quality which charcoal has. This it is that makes the charred peat so proper for green-houses, for charcoal burnt in them is very prejudicial to the plants, and often fatal to the person who attends them.

[The intelligent author has here certainly fallen into a popular error in regard to the true cause of the suffocating quality of burning charcoal. The product of the combustion of charcoal must be essentially the same as from charred peat: the combustible part of both is little else than pure carbon, and the products of their combustion are of course pure carbonic acid. The popular notion is, that the unpleasant odor exhaled from burning charcoal, which has for some time been exposed to a damp atmosphere, and particularly when first ignited, is the suffocating principle: hence the common impression that ignited charcoal taken from a common fire may be burned with impunity in an unventilated room, and that charred peat, which does not exhale the peculiar odor of charcoal, is a safer and less objectionable fuel under the same circumstances. Many lives are annually sacrificed from this erroneous notion. The only true ground of preference of charred peat for burning in green-houses is the slow and gradual manner in which it consumes. Charcoal, in this respect, is much less manageable. It is the sudden and unequal heats from charcoal, rather than any essential difference in the product, that renders its use so objectionable.]

The usual method of burning this peat in Holland, especially by the poor, is in cast iron kettles, and for boiling any thing over it this way saves half the fire it would otherwise take if burnt on a hearth, or in a grate, by the side of the pot reflecting the heat.

[The small Philadelphia furnaces, fabricated from the South Amboy clay of New Jersey, now in general use in our Atlantic cities, are admirably calculated to secure an economical expenditure of heat in the combustion of charcoal for culinary purposes, and for a similar reason. But they ought never to be used in an unventilated room.]

Adjoining to many of the capital towns in Holland there are a great number of small gardens with little summer houses, most of which are built with wood. Near Rotterdam there are nearly a thousand of these gardens, and almost all of them have some orange trees in them. In the winter they are preserved from the intense frosts, which generally last there for nearly three months, by means of this charred peat, the natural firing of that country,

which is burnt in an earthen pan, or cast iron pot, in these little summer houses.

A collected view of the data from these experiments and comparisons is given by Mr. Tredgold. It is as follows:

Kind of Fuel.	Fraction of a pound that will heat one cubic foot of water one degree Fahrenheit's scale.	Pounds of fuel that will convert one cubic foot of water into steam.
Newcastle, or caking Coal	0.0075	8.40
Splint Coal	0.0075	8.40
Staffordshire cherry Coal	0.0100	11.30
Wood, dry pine	0.0172	19.25
— dry beech	0.0242	27.00
— dry oak	0.0265	30.00
Peat, of good quality	0.0475	53.60
Charcoal	0.0095	10.60
Coke	0.0069	7.70
Charred Peat	0.0205	23.00

It will appear, as Mr. Tredgold justly observes in his very excellent "Principles of Warming and Ventilating Public Buildings," that the utmost effect we can hope to gain in applying fuel must be less than double the measure of effect here given; and even to attain that effect, all the caution of conducting a philosophical experiment must be continually employed, which will be found impracticable on a large scale, and altogether incompatible with the simple apparatus and small share of attention which can be devoted to this end in real business, although there are not wanting persons who promise four, six, and even ten times these effects.

**Improvement of Fuel by Mixture.**—It is surprising that so few attempts should be made to improve the fires which are made in the open chimneys of elegant apartments by preparing the fuel; for, as Count Rumford observes, nothing surely was ever more dirty, inelegant, and disgusting, than a common coal fire.

Fire balls, of the size of goose eggs, composed of coal and charcoal in powder, mixed up with a due proportion of wet clay, and well dried, would make a much more cleanly, and, in all respects, a pleasanter fire than can be made with crude coals; and it is believed would not be more expensive fuel. In Flanders, and in several parts of Germany, and particularly in the duchies of Juliers and Bergens, where coals are used as fuel, the coals are always prepared before they are used, by pounding them to a powder, and mixing them up with an equal weight of clay and a sufficient quantity of water to form the whole into a mass, which is kneaded together and formed into cakes; which cakes are afterwards well dried, and kept in a dry place for use. And it has been found, by long experience, that the expense attending this preparation is amply repaid by the improvement of the fuel. The coals thus mixed with clay not only burn longer, but give much more heat than when they are burnt in their crude state.

It will doubtless appear extraordinary to those who have not considered the subject with some attention, that the quantity of heat produced in the combustion of any given quantity of coal should be increased by mixing the coals with clay, which is

certainly an incombustible body; but the fact is certain.

In composing fire balls, it is probable that a certain proportion of chaff, of straw cut very fine, or even of saw dust, might be employed with great advantage. It is wished that those who have leisure would turn their thoughts to this subject; for it is conceived that very important improvements would result from a thorough investigation of it.

For the purpose of lighting a fire speedily, *kindling balls*, composed of equal parts of coal, charcoal, and clay, the two former reduced to a fine powder, well mixed, and kneaded together with the clay moistened with water, and then formed into balls of the size of hens' eggs, and thoroughly dried, might be used with great advantage instead of wood.

(To be continued.)

## MECHANICS MEETING.

We call attention to the proceedings of this meeting. It is honorable to the mechanics that they thus feel and express their unwillingness to have their pursuits associated in public estimation with what is deemed fitting punishment for felons.

At a large and respectable meeting of Mechanics and others, opposed to the system of State Prison Monopoly, held at Enterpeian Hall on Tuesday evening, the 20th inst. Gideon Lee, Esq. was appointed Chairman, and Messrs. Thomas Constantine, D. Berrian, P. Hedl, Joseph P. Simpson, J. C. Tucker, John Anderson, and Robert Smith, were appointed Vice Presidents, and Robert Taylor and John Renwick appointed Secretaries.

The call of the meeting being read, the report of the Executive Committee, with the Memorial and resolutions, were submitted. After which the meeting was addressed by Messrs. Robert Walker, Robert Taylor, Austin Baldwin, B. Gillespie, D. K. Minor, and Alex. Ming, jr.

The report of the Executive Committee, together with the resolutions and memorial, were on motion unanimously approved.

The Executive Committee respectfully report, that the delegates appointed at the meeting held in the Park, in this city, on the 30th June last, proceeded to Utica, and attended the State Convention of Mechanics, which assembled on the 20th August, and your Committee is highly gratified in being able to state—that notwithstanding the prevalence of the cholera in several parts of the State prevented many Delegates from attending; ninety-nine Delegates were present, and represented thirty four Mechanical branches of business. The following is a list of the branches represented, and the number of Delegates from each branch.

From the Tailors 10, Cabinet Makers 9, Coopers 6, Saddle & Harness makers 6, Cordwainers 7, Blacksmiths 4, Hawers 4, Stone Cutters 4, Chair Makers 4, Silver Platers 3, Marble Cutters 3, Tin Plate Workers 3, Plane Makers 3, Builders 3, Coach Makers 2, Carpenters 3, Printers 2, Brush Makers 2, Watch Makers 2, Iron Founders 2, Tanners and Curriers 2, Cabinet and Chair Makers 2, Piano Forte Makers 1, Locksmiths 1, Brass Founders 1, Comb Makers 1, Masons 1, Silver Smiths 1, Machinists 1, Burr Stone Manufacturers 1, Copper Smiths 1, Plough Makers 1, Wagon Makers 1, Potters 1.

Your Committee report, That although the convention was composed of persons from every section of the State, and assembled together without any previous arrangement, as it respected the course to be pursued to obtain redress, yet were they of one heart, and one mind—they were determined to exert themselves to the utmost,—to unite together as mechanics, not as partisans,—and they unanimously resolved, that they would pursue the present detestable Prison system of this State, till justice be accorded to the just claims of Mechanics.

A corresponding committee in each County was appointed, consisting of two Mechanics,

and a central committee of six Mechanics who reside in Utica. The central committee has recommended the citizens of each county to memorialize the Legislature on the subject of employing convicts at mechanical business. The corresponding committees of Counties have communicated this information to the Executive Committee of counties, and memorials are now receiving signatures in many parts of the State in accordance with the recommendation of the central committee, a memorial will be submitted to this meeting. The Convention also recommended that a Convention be annually appointed to meet at Utica on the 3d Wednesday of August in each year, until we obtain redress.

The utmost harmony and unanimity prevailed among the Delegates, while together, and they parted with a determination never to give up the contest, until *this prison system*, which robs them of their bread, is abolished. Your Committee have endeavored to bring the subject before the public in its proper light, and great exertions have been made by Mechanics throughout the State to convince the community of the errors and injustice of the system, and notwithstanding that but a year since, many were found who approved of the system; and many who took neither part nor lot in the matter; yet now, it is generally admitted that the system needs alteration; and we are pleased to add, that Agriculturists, Trades, Mechanics, and Judges of Courts, are now giving their testimony against it, and are heard to exclaim, it is wrong, unjust, and degrading to mechanics—it must be put down;—and we will use our exertions to render obsolete and unknown, the term "*State Prison Monopoly*." Your Committee has since its appointment held sixty-seven meetings, has corresponded with the corresponding Committees of counties, the Central Committee, and many members of the Legislature, and has expended for printing, postage, room hire, &c. upwards of \$1000, and it is to be hoped that it will not all be labor in vain but, that we may yet have the satisfaction of experiencing a total change in the system, and be able to say the Legislature of the State of New York, in enacting laws respecting prisons, has had in view the republican maxim, "the greatest good to the greatest number." The Committee add, that the members of the Assembly from this county have given satisfactory evidence to them, that their exertions will be used to remedy the evil of which we complain; and already has the subject been referred to a Special Committee of the Assembly, as we desired, instead of the Standing Committee on prisons; and one of the members from this county is Chairman of the Select Committee. Your Committee in conclusion, submit the following resolutions:

1. Resolved, That this meeting deem it highly expedient to express publicly our fixed and unchanged opinions of the injurious and oppressive bearing of the labor of our State Prisoners, as now employed, on the Mechanic Trades and Mechanic Interests.

2. Resolved, That the recent and emphatic expression of public sentiment, in accordance with ours, by all classes and all parties of our fellow-citizens, strongly confirms the correctness of our views, and inspires us with courage and energy to persevere in our efforts for an early remedy.

3. Resolved, That we think we perceive an earnest of speedy relief in that measure of the Government constituting a special Board of Commissioners to inquire and report on this grievance to the present Legislature.

4. Resolved, That we do most cordially concur in the sentiment of Governor Marcy, as expressed in his Message, "That no consideration connected merely with the income of the Prisons, should be permitted to interpose any obstacle to removing all just grounds of complaint."

5. Resolved, That we firmly believe that the Agricultural portion of our State, when convinced of the extent of the grievances we complain of, will most cheerfully co-operate with us in the removal of them.

6. Resolved, That we feel more honest sympathy for a single innocent Family, deprived of subsistence by the interference of Calprit labor, than the banishment of a host of felons would cause us.

7. Resolved, That while the evils of excessive competition among individuals and selling goods and wares for less than their cost, soon cures itself by the exhaustion of capital so employed, it would be madness for individuals to attempt to compete with the exhaustless capital of the State when so employed.

8. Resolved, That this Meeting recognize as two of the great fundamental principles, on which the superstructure of our State Constitution is founded, the protection of property, and an equal and uniform system of taxation.

9. Resolved, That we are convinced from practical experience, that the present system of State Prison labor is partial and oppressive in its operation upon us as Mechanics, and violates every just principle of taxation, in compelling us to pay indirectly much more than the just and equitable ratio of Taxes for the support of the State Prisons at Sing Sing and Auburn.

10. Resolved, That not only do we consider these mammoth institutions unjust and anti-republican, as it affects our pecuniary interests, but as much more injurious and reprehensible as it affects what is as dear to us as life, our characters as citizens and Mechanics. As it is but too evident that the direct and necessary consequence of our present system is to lower and degrade us, and make the character and profession of a Mechanic synonymous with that of convicted felons.

11. Resolved, That we are compelled to declare, as our settled conviction, that the present system of State Prison management instead of operating as a school of moral reform, most generally is a school of vice and a nursery of crime, nay more, that when their degraded inmates are vomited forth upon society, experience too fatally illustrates that they not only propagate their vicious principles among those with whom they associate, but their conduct inflicts a stigma on the hitherto honorable character of Mechanics, degrading even the virtuous in their own estimation and that of their fellow citizens.

12. Resolved, That it is our hope that every class of Mechanics in every town in our State will see the necessity of union and concert of action on this subject, and that they will again come forward as the heart of one man to insist on a redress of the grievances under which we suffer.

13. Resolved, That for ourselves, we will pursue this subject with unabated zeal and untiring perseverance, that we will neither slumber nor rest, till the name of State's Prison Monopoly and Prison competition with Mechanic Trades be mentioned with the things that were, a mere memento of by-gone oppression and mistaken Legislation.

A motion was made and unanimously approved that the present Executive Committee be continued with power to add to their numbers and fill all vacancies that may occur in their body. A vote of thanks to the Executive Committee, was unanimously adopted, for their past services.

Resolved, That the Executive Committee be empowered and instructed to make arrangements for obtaining signatures to the memorial.

The following extract from a letter from Thomas Jefferson was read.

MONTICELLO, SEPT. 24th, 1823.

Thomas Jefferson returns his thanks to Mr. — for his view of the inside of the New York State Prison. It will certainly have effect towards reforming our ideas of the penitentiary system which, however humane, does not answer the purposes of correction. It is high time to resort to the original idea of solitary imprisonment debarred of all employment.

It was then Resolved, that the proceedings of this meeting be signed by the officers and published in the daily papers.

GIDEON LEE, President,

THOMAS CONSTANTINE  
DANIEL BERRIAN  
PAULUS HEDL  
JOSEPH P. SIMPSON  
JOHN C. TUCKER  
JOHN ANDERSON  
ROBERT SMITH  
ROBERT TAYLOR  
JOHN RENICK

Vice Presidents.

Secretaries.

N. B. As an evidence of the feeling existing among Mechanics on this subject, we state that about 2000 signatures were obtained to the memorial, on the above meeting.

## NEW-YORK AMERICAN.

JANUARY 17—23, 1835.

## LITERARY NOTICES.

BIOGRAPHY OF THE SAVIOUR AND HIS APOSTLES, WITH A PORTRAIT OF EACH; by the author of "the History of the Bible," &c. New York: General Agency Office, Nassau street. We don't know when we have seen a more neatly published and attractive little volume. The style of engraving, which is by *Ormsby's* machine, is new and striking, presenting the head in relief, as on a cameo or medallion, and beautifully shaded. The portraits are all taken from *Leonardo de Vinci's* celebrated picture of "The Last Supper;" and both in likeness to those in the copy, and in spirited expression and execution, are deserving of all commendation. The biographies are carefully compiled and avouched throughout by reference to the New Testament.

In addition to what we have said of this little volume, our readers will perhaps not be displeased with an account of the machine which turns out without aid from, or even sometimes the supervision of, human agency, such fine works of art, as these portraits display.

The inventor, *Mr. Ormsby*, is a native of Connecticut: the process is that of medallion engraving, heretofore carried on laboriously by hand; but now, with this machine, it can be carried on to any extent without any human agency, after the plate and the copy are once adjusted, and the mechanism, of which a weight is the moving power, is set to work. It can only be applied to raised surfaces; that is to say, any cameo, medal, or embossed design. It cannot copy with effect a flat surface, such as an engraving. *Mr. Ormsby* exhibited to us the machine in action, but we have so little mechanical knowledge or skill, that we should wholly fail in any attempt to describe, although we could at once perceive and comprehend, its accuracy, and efficiency, and ingenuity.

The plates in this volume are the first executed by the machine, and with the vignettes, present samples of the various kind of work and shading it is capable of producing.

ROMBERT, A TALE OF CAROLINA: 2 vols. 12mo. MUNRO & FRANCIS, Boston, 1835.—Of this new American novel just published, but which we have not read, we have the following notice from one who has read it, and in whose taste and judgment we have confidence.

"The design of this book—for in these days it would seem that novels must have a design over and above all literary and pecuniary considerations—is to illustrate fanaticism, and hold it up to detestation; and, so far as that goes, the author of *Rombert* is eminently successful. The sketches are occasionally extravagant, it is true; and much that is intended for accurate delineation is wrought up to the borders of caricature; but, in the main, the leading object is ingeniously pursued and well developed, and probably no one will read the book without an increased disgust for that most revolting of moral maladies—fanaticism.

The work is interspersed with historical notes, showing that many of the details are matters of fact, a circumstance which essentially promotes the corrective purpose of that author; but, in the same ratio that such notes give value to the book as a moral essay, do they detract from its value as a novel. If one is to follow a writer through the regions of fiction, he prefers an uninterrupted

journey; and if molested by digression and episode he will soon imagine (what it is material to the writer that he *should* imagine) that he is travelling through realities, and taking a lesson from the experience of real life. But these constant references to historical proof—these frequently recurring indorsements of the author's veracity—very much weaken the illusion. The prominent faults of the work as a novel, originate from its embodying too much of plot, character, incident and catastrophe; too much material, in short, for one romance. When considered separately, each part is skilfully conducted; but when collectively, all the parts are not harmoniously combined; nor, indeed, could they be, within the compass of six hundred duodecimo pages if *Scott* himself had written them. Taking it as a whole, however, and regarding it as the first essay of an inexperienced writer, (which, from the nature of its faults, it certainly must be) it is a work of great merit, as it unquestionably is of great interest. Its defects, which are many, are those of a beginner; but its beauties, which are also many, are those of true genius. The author needs little but judicious criticism on the part of his friends, and careful revision of his own part, to become eminent in these days of literary fecundity: and if he can gain an ease in composition and a polish in language, together with the tact of omitting what is immaterial, and avoiding indistinctness in his narrative, he may hope to stand proudly and permanently in the front rank of American novelists."

THE AMERICAN MUSICAL JOURNAL, a Monthly Repository of Musical Literature, &c. &c.; No. 2, vol. 1; N. York, JAS. DUNN.

THE FAMILY MINSTREL, a semi-monthly Journal, devoted to the interests of Musical Education, &c. &c.; No. 1, vol. 1; New York, CHARLES DINGLEY.

Here are two candidates for the favor of the musical world—the first, the *Musical Journal*, addressing itself to all lovers of music—the second, the *Minstrel*, asking only or chiefly the suffrages of those who prefer sacred music. There is perhaps scope enough for both—if not, the chances would seem most in favor of the more comprehensive enterprise.

THE ALEXANDRIAN, a republication of valuable Literary and Scientific Works, No. 1; price six cents! N. York, WM. PIERSON.—If people don't read now, and good books too, it is not because reading is an expensive indulgence; for here, for example, not to mention other cheap publications, in six numbers at six cents each, *D'Israeli's Curiosities of Literature* will be completed. That work sells for four dollars: it now will be accessible in good print, though rather small, to as many as choose to buy, for 37 1/2 cents.

CRUISE OF THE U. S. FRIGATE POTOMAC ROUND THE WORLD, DURING THE YEARS 1831-4. BY FRANCIS WARRINER, A. M.—N. Y., LEAVITT, LORD & CO.—We always see with pleasure publications which, like this and others issued from the press by gentlemen connected with the naval service, go to show, that in the most distant seas, and in places however remote from their native land, the feeling of "what will they say of us at home?" and the desire to justify the solicitude, pride and the confidence of that home—seem to accompany these gallant ocean rovers.

The volume before us—tho' not very skilfully prepared—is interesting, and presents in its details and the manner of its narrative, a guarantee

of the truth and sincerity of its statements. We make room for a short extract, descriptive of the state of expectation on board the *Potomac* when the attack on *Quallah-battoo* was resolved on.

Our ship now presented a busy scene. It was determined to commence an attack upon the town the next morning, and every necessary preparation was accordingly made. Muskets were cleaned, cartridge boxes buckled on, cutlasses examined and put in order, &c. During the evening, the Commodore sent for the officers commanding the several divisions, and gave them their instructions. They were ordered to land, surround the town and forts, and demand indemnity for the outrage committed upon the *Friendship*, with the punishment of those concerned in the barbarous massacre of her crew. I had some conversation with a few of the junior officers, upon the subject of the perilous enterprise in which they were about to embark. They felt that it would not be so much a matter of jest, as they had been disposed to think it might be. There was some shrinking at the thought of impending danger. They might however have remembered, that

"The brave man is not he who feels no fear,  
For that were brutish and irrational;  
But he whose noble soul its fears subdues,  
And bravely dares the danger nature shrieks from."

As eight bells, (twelve o'clock at night,) all hands were called. Those assigned to take part in the expedition were mustered, when Lieut. Shubrick, the commander of the detachment, gave them special orders. No man was to utter a word after he had entered the boat; no one was to fire till the command was given; and no man was to desert his ranks. Considerable time was occupied in getting the men into the boats, and in making all things ready. Several of the officers felt impatient at the delay, and were fearful that they would be unable to effect a landing in season to surprise the enemy. At length the gallant band, to the number of two hundred and eighty-two men, including officers, left the ship about two o'clock.

The last words we heard were, "Let fall, give way, men." Here was a moment of interest. All before in regard to fighting the Malays had been mere talk; but now there was a stern reality.—The period had arrived when the grand object of our voyage hitherto was to be accomplished. The death-warrant of the Malays had been pronounced, and avenging spirits had gone forth to demand satisfaction for the wrongs of their countrymen. The blow was to be struck, and victory or defeat was to ensue. There was something awful in the scene before me. The expedition proceeded slowly on their midnight errand in perfect silence, save an occasional whisper from the officer in command, with muffled oars, the soft dipping of which we could faintly hear, and nothing but the stars of heaven to guide them to their place of disembarkment.—My own reflections were any thing but those of a cheerful character. I found it impossible to divert myself of the fit of melancholy which had seized me. I retired to my couch, but not to sleep. It seemed as though a spell had fallen upon the ship. Not a word was spoken. The steps of man had ceased to be heard, save those of the officer on watch. A silence like that amid the mournful repositories of the dead, pervaded the ship, interrupted only by the striking of the bell, which proclaimed the hour of the approaching destiny of the Malays. The hours moved tediously on, as we anxiously awaited the dawn of day. Each one's thoughts were biased in contemplation of what might be the fate of his companion in arms. In this state of painful suspense, I for a moment lost myself in sleep; when I was awakened by the quarter-master exclaiming, "W—, hot work going on ashore, Sir." It was then broad daylight, and I dressed myself and hurried on deck. The scene was one of fearful interest. The din of war was heard throughout the town, threatening destruction to every opposer. The reports of the cannon and musketry, as they came thundering across the water, told us plainly that the work of death was going on.—Sheets of fire were arising from the town wrapped in flames, and the launch, with its cannonade and swivels, was doing full execution upon the retreating foe.

Commodore Downes had stationed himself in the larboard gangway of the ship, with his glass, not to leave till the engagement shall be over.—He felt anxious to know how the affair would terminate, and at times thought it would be necessary to take the ship nearer in shore, in order to protect his men. The remainder of us were posted in different parts of the ship, some in the tops, some hanging upon the shrouds, and some on the "Jacob's ladders," all gazing with breathless anxiety. Some of the sailors were in the rigging, and among them our unfettered Malay prisoners, watching the movements with immense interest. We were all surprised at the resistance apparent on shore.

About an hour and a half after the action commenced, two boats were seen pulling off to the ship. They approached us in silence, and from the cast of gloom visible in the countenances of the boat's crew, we conjectured that some of our brave fellows had fallen. The sight of two bloody corpses soon proved that our conjectures had been but too true. I never shall forget the appearance of their features. They were much distorted, and the countenance of one, especially, exhibited a wild and terrific aspect. His long hair hung in matted tresses over his shoulders and glaring eyeballs. His name was Brown.—He was shot near one of the jungles, where a body of the Malays were lying in ambush. The ball entered his breast, and the last words of this unfortunate marine, as he was falling, were, "I am a dead man." The name of the other person was Smith, a maintopman. He met his death just at the entrance of one of the forts. He had discharged his musket and wheeled about for the purpose of re-loading, when he was shot directly through the eye. One of the sailors standing near him was slightly wounded by the same ball. Smith was a tall, well built man, distinguished for his nerve of arm and integrity of soul. In the hour of peril, when the fierce winds of heaven were spending their fury on our ship, he was ever among the first to meet their rage.

An hour afterwards the American colors were seen proudly waving over the battlements of the largest fort. We had been in deep suspense, anxiously awaiting the result of the contest on shore. The sight of our flag waving in the breeze, and the rush of the main body of our forces into the fort, raised a smile of joy upon every countenance.

**GUY RIVERS—Second Edition.**—The popularity of this work has induced a call for a second edition. In revising Guy Rivers for reprint, the author has shown much good sense, in availing himself of the criticisms which followed its publication, and making occasional alterations here and there in the phraseology. These, without impairing the spirit, add essentially to the correctness and value of the work.

**ROLLIN'S ANCIENT HISTORY, WITH A LIFE OF THE AUTHOR.** By James Bell. First complete American Edition. 2 vols. George Dearborn.—We do not hesitate to pronounce this one of the most elegant and liberal publications that has long issued from the American press. As a cheap but handsome reprint of a book that ought to be in every one's library, it may be regarded as belonging to a series of valuable works, got up in similar style, and now continually appearing from Mr. Dearborn's press. They are published in the royal 8vo. form, and generally form two volumes; nor is there one among the number, whose reputation Time has not stamped beyond all cavil. Every friend of sound letters will hope for their continuance, and that their enterprising publisher may be amply rewarded.

The volumes now issued, in addition to the matter contained in the ordinary editions of Rollin, include his history of the Arts and Sciences of the Ancients; which whether from fatuity or imperitance has been generally struck out by the English publishers, who have hitherto been servilely copied in this respect by their Ameri-

can brethren. The work as now first given complete in this country, is embellished with maps and diagrams, and ornamented with two handsome vignettes, in addition to a portrait of the author.

## Literary Items.

An interesting little volume has recently been published by M. Paulin of Paris, entitled, "Le Romancero Francais, ou Histoire de quelques Anciens Tryuvers, et Choix de leurs Chansons."

These "Ancient Songs of Love and War," originally composed by French Trouvres, res, which have been buried in oblivion for the last 600 years are now once more brought to light by the fortunate investigations of this young "employé aux manuscrits" of the Royal Library.

M. Marcell has just published a History of Egypt, from its conquest by the Arabs to that by the French, in an 8vo volume.

Publications of the Messrs. Harper and Brothers, of New York.

"During the year that has just ended, the issues of this house have amounted to upwards of five hundred thousand books of an average size of Bulwer's 'Last Days of Pompeii.' This number is made up of new editions of books published by them in former years, and of sixty-five new works, making upwards of one hundred volumes; of these, forty-five were published with copy-right—either entirely American, or translations made in this country, or English works edited and improved by American authors: the remainder were re-prints from English books. During the early part of the year owing to the pressure of the money market and the general prostration of business, they curtailed their operations to a considerable degree, or the sum total of their publications in the course of the year would probably be greater than it is by two hundred thousand volumes; but even now it exceeds that of any former year. In their opinion, the number of books printed and published in the United States since the first of January 1834, is very nearly twice as great as it has ever been known before in the same space of time."

Mr. Van Hammer's History of the Turkish Empire is now completed in 10 vols. 8vo. The history terminates at the peace of Kainardji, in 1774.

A sort of literary congress is about to be held at Berlin in order to draw up some general regulations, with a view to secure the copy-right of authors and booksellers throughout the whole of Germany. A committee of booksellers have already been formed at Leipsig, and protocoles have been exchanged between this committee and the Berlin commission.

The first instance in the annals of Turkish literature, of works announced for publication by subscription, appeared in the Turkish State Gazette of October 22d, 1833, and the works thus signalized are three historical, five grammatical, and four political. As the historical works are by far the most interesting, we subjoin the titles of them.

I. Lives of the Sultans and Viscers by Osman-ade Ahmed Taib, who died in 1723, with a continuance by three others.

II. Lives of Muftis by Suleiman Seadedden Ben Mehammed, celebrated under the name of Muesakim Efendisade, and written by him in 1744.

III. Lives of the Reis.Effendis, by the Reis Effendi Ahmed Besmi, and with a continuation to 1807 by Suleiman Faik.

The new novel, by Miss Pardoe, author of Traits and Sketches of Portugal, is to be entitled, "The Mardens and the Daventrys."

"Young Hearts," a Tale, which is to appear under the sanction of Miss Jane Porter, will be ready in the ensuing month.

A Translation of the last work of the celebrated Schlegel on the Philosophy of History, is just completed, and will appear forthwith, in London.

Previous to her leaving England, Mrs. Jameson left in the hands of her publishers the corrected copy for a new and enlarged edition of her interesting work, "The Lives of the Celebrated Female Sovereigns."

## SUMMARY.

The United States ship St. Louis, Com. Henley, reached Pensacola on the 25th ult. in three days from Havana. The Grampus and Experiment were in the neighborhood.

The United States frigate Potomac, Captain Nicholson, reached Gibraltar in 23 days from Boston.

**DESPATCH.**—The Philadelphia National Gazette, printed probably about two o'clock yesterday afternoon, acknowledges the receipt by the Camden and Amboy Railroad, of the Courier & Enquirer of the same morning.

The passengers by the same line from Philadelphia, which they left at 8 o'clock, were yesterday landed in this city in six hours and twenty minutes.

Boston Jan. 13th.—A massive block of granite to form one of the pillars for the New Court House in this city, was started yesterday morning at half past nine o'clock, in Quincy, by a team of sixty-five yoke of oxen and 11 horses, for the city, under the direction of GRIDLEY BRYANT, Esq. It was brought by the way of the Brush Hill Turnpike, entered on Boston neck 20 minutes of 7 o'clock S. M. and arrived at the Court House half past 9, where it was welcomed with nine cheers, by a large concourse of people. And yet we dare say the unconscious block gave no sign of gratulation in return.

[From the Mercantile Ado. of this Morning.]

Our correspondent at Marseilles, under date of Dec. 10th, writes as follows:—"The cholera still rages on board the American men of war at Mahon. The Delaware had, on the 29th Nov. about 150 cases on board, and had lost about 20 men, but no officers. The authorities still kept them in quarantine, notwithstanding that several cases are daily declared in the town."

BUFFALO, JAN. 12.—Steamboat Burnt.—We had an alarm of fire about nine o'clock last evening, caused by the conflagration of the Steamboat Daniel Webster, in the harbor. She was moored at the dock, in front of the store house of Pratt, Taylor & Co. The Steamboat Gov. Marcy lay immediately astern, and the Brig Indiana under her bows—all immovably fixed in the ice; while the wooden store house was only at the distance of a few feet upon the shore. When we reached the scene, the Webster was burning furiously, both forward and aft,—the centre around the engine not having yet kindled. The fire engines were placed upon the ice of the harbor, and attacked the flames simultaneously, at different points—which were finally quelled.

On visiting the boat this morning, we find her inside works entirely destroyed, with decks, upper works, and engine considerably damaged—but the frame apparently uninjured. The amount of damage we have heard estimated at from six to eight thousand dollars—no insurance. The Webster is owned, principally, by Pratt, Taylor & Co. of this city, Dows, Cary & Co., Albany, Al-laire, New York, &c.; was new, and one of the swiftest boats upon the lakes.

The fire was the work of design, though no motive of the hellish deed is known. There had been no fire in the boat for more than six weeks past, and it appears to have been kindled both in the forward and aft part at the same time. The incendiary was a most considerate scoundrel, for he chose a night so calm, that the flames rose perpendicularly. Had the wind been high, several of the steamboats and vessels, with a range of extensive wooden storehouses must have been destroyed.

The Steamboat New York, also in port, has been twice fired within a few weeks, and in each instance, the fire went out, most fortunately, without damage, and before the fact was discovered, —[Whig.]

APPOINTMENTS by the Governor and Senate.—Tuesday, Jan. 13. 1835.

New York.—Garret Storm, Director of the Phoenix Bank. Charles Graham Jr. and John Harris, commissioners of deeds. Joseph Flynn, inspector of domestic distilled spirits.

A gentleman near Natchez, has liberated his slaves, about twenty in number, and furnished them with from \$200 to \$400 each, to promote their comfortable settlement in Liberia.

NEW ORLEANS, DEC. 29.

**Unprofitable Risk.**—The *AERONAUT*.—The day was beautiful for the ascension, a large company had assembled in the enclosure, soldiers and ladies were commingled among the groups—the fearless aeronaut went up—but melancholy accidents brought his career to a brief close. The wind was too high for a safe ascension—it came in strong puffs, and his balloon and himself were liberated at the moment of a violent flaw. The car was swept along almost horizontally at first, striking the benches filled with spectators and throwing down and injuring several persons, and then was carried up and dashed against the chimney of the arsenal, standing in the enclosure, which was instantly struck down, and against which Mr. Elliot fractured his thigh bone. Several of the bricks of the chimney were thrown into the car, preventing its further elevation, and the aeronaut was driven about among the tops of the houses; was forced through the upper window of one, bruising himself severely again, and cutting his face and head with the broken glass;—and was then jerked out, with several of the cords attaching the car to the balloon cut, and the car turned nearly bottom upwards. In the midst of all the peril he discovered wonderful courage and presence of mind, and indeed to these qualities owes the preservation of his life. No one less intrepid and less self possessed could have escaped through the difficulties and dangers encountered by him. After clearing himself from the buildings of the city, he was swept towards the river, and notwithstanding his bruises, wounds and fractured limb, he asserts he would have continued upon his fearful journey had he not have been interrupted by the rigging of the shipping at the levee. He was blinded by the blood from the wounds over the eyes, or he thinks he could have guarded himself better against the accidents, and would have been able to throw out ballast enough to clear him of the vessels. His balloon caught at the mast heads of two ships, to the rigging of which he clung until rescued from his danger by the generous exertions of a friend and the sailors on board. The broken thigh bone was forced through his drawres and pantaloons. He was taken to his lodgings, and placed under the care of Doctor Luzenburg and Doctor King. He is in good hands, was comfortable last evening at nine o'clock, surrounded by kind friends and doing well.

Mr. Elliot is a worthy man in all respects; has an interesting family, for whose support as well as for the public gratification, he boldly risks his life and limb—the public sympathies are and ought to be with him, and an appeal will be made to the generosity of this community in his behalf. —[Bulletin.]

[FOR THE NEW-YORK AMERICAN.]

HYDE PARK, (Dutchess Co.) JAN. 10.

**Unprecedented Cold Weather.**—Since the 3d of this month, the thermometer has ranged lower in this place than has ever been remembered by our oldest inhabitants. I have for some time back been in the habit of keeping a list of the ranges of the thermometer; and since the 3d, send you an exact account of it, taken three times per day, at the hours of 7 A. M., 12 M., and 9 P. M. You may rely on the correctness of the following report. The thermometer is one of Poole's manufacture, Fahrenheit's scale, and was placed on the north side of the house.

1835.	7 A. M.	12 M.	9 P. M.	Remarks.
Jan. 3	0 2	5 0	0 10	Wind slight, N. N. W. clear.
4	0 25	0 6	0 25	do do do
5	0 32	0 2	0	do do do
6	8 0	1 0	0 7	Wind strong, do hazy.
7	0 8	0 1	0 8	do do clear
8	0 12	1 0	0 5	Wind slight, do do
9	0 13	5 0	0	do do do
10	0 14			do do do

The city Inspector made his annual report of deaths during the past year, last evening. The total number from 1st January, to 31st December was nine thousand and eighty-two, being an excess of 3336 over the last year. There were of consumption 1471; small pox 233; cholera 971; of these there were 4745 children under ten years of age.

**SCHOOLS IN MASSACHUSETTS.**—By a resolve of the Legislature, adopted on the 31st day of March last, returns were required to be made from the several towns, shewing the condition of the schools, to the office of the Secretary of State.—On the 31st of December, returns had been received from 261 towns, and there remained at that time 44 towns, by which none had been made.—In these 361 towns, there were 2,251 school districts; and the number of male children attending school between four and sixteen years of age was 67,499, and of female children 63,728. The number of persons between the ages of sixteen and twenty-one, returned as unable to read and write, was 158. There were in these districts 1967 male, and 2388 female instructors.—The amount raised by taxes for the support of schools in these towns was \$310,172 87, and by contribution, \$15,141 28; and the estimated amount paid for tuition in academies and private schools, was \$276,575 75. The average number of scholars attending academies and private schools, was 24,749. The amount of the local funds returned is about \$127,000, and there are funds invested in real estate, the amount of which is not stated. In those cases, where only the income is given, the aggregate amount is about \$2,500 per annum. From the above returns, it appears that the number of scholars in the common and private schools and academies is 158,976, and the amount annually expended \$601,895 90.

According to the Report of the Auditor General to the Legislature of Pennsylvania, the Banking capital in the city and county of Philadelphia, (exclusive of the U. S. Bank) amounts to \$12,812,875, the bank notes in circulation amount to \$4,053,247; and the specie on hand is \$5,332,961. The Country Banks of Pennsylvania have an aggregate capital of \$4,966,689; their notes in circulation are \$3,532,049; and their specie on hand is \$1,089,640. The total banking capital in the State is \$17,779,562, and the amount of notes discounted is \$26,749,619.

The Knoxville (Tenn.) Register of the 7th instant states that the steamboat Reliance, after a detention of ten months in the Muscle Shoals, had at last made her way through the difficult obstructions of the Shoals, and reached Decatur on the 29th ult. She was expected at Knoxville in a few days.

**Schr. Hudson, of N. Y.**—Capt. Wm. Sherwood states that his schr. struck on Stoney Point, near Cape Poge, about 4, A. M. 6th inst. when hauling off, having sounded in shoal water. The sea was heaving violently, and it was impossible to carry off an anchor. At 9, she leaked very fast, and could not be kept free. Attempted to land in the boat—three men reached the shore—the boat was then hauled off to the schr. by means of a line attached; a passenger and two seamen put off; when about half way to the shore, the boat upset, but the men succeeded in reaching the shore. The mate with three men, then attempted in vain to get the boat back again to the schr. and proceeded to the Light House at Cape Poge, leaving those on board exposed to the cold and sea, which was continually breaking over the vessel. At 11 at night, Mr. Edward Donnelly expired on the deck of the vessel, and at 12 Mr. Pierson Newell expired. At 9, next morning, the crew returned from the Light House, resolved to rescue those on board or perish. The gale having somewhat abated, they boarded the vessel and took from her Capt. S. his son 16 years old, and Mr. John Clark, of Ipswich. They all proceeded to the Light House, where they were kindly received. Mr. Peter Laffen, of Halifax, died immediately after reaching the Light House. Part of the crew remain at Cape Poge, badly frozen. Capt. S. and Mr. Clark are at Edgartown,

badly frozen. Mr. Newell belonged to Boston—Mr. Donnelly's residence was unknown.

#### FOREIGN INTELLIGENCE.

THE LATE FOREIGN NEWS, by way of Boston, is not very important. It seems certain, that Parliament must be defeated. Sir Robert Peel having, by accepting office, vacated his seat in the House of Commons, has put forth an address to the Borough of Tamworth, which he represents, which, as embodying the sentiments of the new ministry, and setting forth the principles upon which they mean to proceed, will be looked upon with interest.

Captain Ross (the navigator) is now Sir John Ross and is about to receive "the honors of the third class of the Order of Bath."

The dates from Paris are to the 18th. The trial of the *National*, defended by M. Cuvell, with his wonted courage and eloquence, before the House of Peers, excited great interest. He spoke in terms of uncompromising contempt for those noble persons; and in referring to their past acts, pronounced the death of Ney to be a judicial assassination, to which sentiment, a Peer present, Marshal Exelmans, distinctly assented.

The Chamber of Deputies had been engaged, through its Standing Committee, on two projects for an amnesty, which, however, were rejected by eight out of nine of those Committees. Hence these propositions would not be publicly discussed.

M. Passy was re-elected a President by 270 out of 310 votes.

The first division of the Polytechnic school, to the number of 115, had been dismissed; it does not appear for what offence.

General Bernard has taken his seat in the French Chamber of Peers.

From Spain the news is of little moment, though *Mina* would seem to have intimidated the Carlists, and restrained their irruptions from their mountain fortresses.

LONDON, DEC. 19.—The Earl of Aberdeen has been removed from the Admiralty to the Colonial Department, to make way for Earl de Grey, who is to be First Lord of the Admiralty.

Lord Granville Somerset is to be First Commissioner of Woods and Forests.

Lord Lowther is, we understand, to be Chancellor of the Duchy of Lancaster.

The Board of Control is to consist of Lord Ellenborough, Sir Andrew Grant, and Messrs. Planta and Sullivan.

Sir John Beckett is appointed Judge Advocate General.

There are rumors of Sir James Searlett having a peerage, and that Lord Combermere is to go to Ireland as Lord Lieutenant, or to India as Governor General or Commander in Chief.

It seems generally believed that a dissolution of Parliament will take place soon after Christmas.

Postscript, six o'clock p. m.

The following appointments have now transpired:

Lord Edward Somerset, Surveyor General of Ordnance.

Colonel Perceval, Treasurer of Ordnance.

Sir William Rae, Bart., Lord Advocate.

Mr. Stuart Wortley, under Secretary of State for the Colonies.

It is also reported that the Duke of Buccleuch is to be Lord Lieutenant of Ireland.

FRONTIERS OF POLAND, Dec. 6.—The Emperor Nicholas has traversed Poland without leaving a trace of his presence. The mitigation of the condition of the political prisoners, which was promised, has not taken place. The women who were arrested for not having denounced their husbands, remain in prison.

A few days before the arrival of the Emperor a revolting sentence was passed upon the sister of the unfortunate Szpeck, who was shot at Warsaw for some political offence. This young girl has been sent to the military colonies, where she is to be forced to marry a Russian soldier.—Her mother has at the same time been sentenced

to ten years' hard labor at Wilna. Made-moiselle Karaka, an inhabitant of the Palatinate of Kalies, has been torn from her family and sent no one knows where. The motive for her arrest is said to have been the discovery of a ring, which had a motto displeasing to the Russian police. The presence of the Emperor did not lead to any change in these arbitrary and atrocious sentences. Prayers and supplications were made in vain.

*Patriotism of the Ladies.*—About forty of the youngest, prettiest ladies of Frankfurt, in Germany, all of whom belonged to the society for the relief of the Poles, were recently found implicated in procuring the escape of several prisoners confined for political offences. They sent saws and files to the prisoners wrapped up in pastes and cakes—a specimen of feminine tact and spirit, worthy of all praise.

[From the Journal of Commerce.]

CANTON, JULY 28, 1834.

Lord Napier, the British Chief Superintendent, has arrived in Canton, and has organized his establishment. His views are not known, but it is generally allowed that his presence is entirely uncalled for. Some of the Hong Merchants were sent by the Vice Roy to Macao to stop him from coming to Canton, but they missed him, and he arrived here in the night. We doubt whether any serious obstacle will be presented to his remaining, provided he keeps quiet. But his Lordship will be much mistaken if he looks for any diplomatic courtesies from the Chinese authorities. It is probable that his residence will be tolerated on the ground that he is a merchant in the pay of the Company; but if he plays the mandarin and forces upon the Vice Roy his official dignity—or if he interferes with the established customs of the country, intermeddling with its judicial concerns, or attempts changes in its commercial regulations, it is more than likely he will receive an unqualified order to quit, expressed in terms not the most complimentary.

CANTON, JULY 1st.—The immense injury which this province has suffered far exceeds the damage done by the inundation of last year. The natives are horror struck, and, though blinded by pagan superstition, acknowledge the hand of God. The calamity not yet being known to its full extent, as even at the present moment the water has not yet entirely subsided, it is thought that four fifths of a most promising crop in the low ground is destroyed. We are not informed that lives have been lost, but have to record with deep feelings of compassion that several thousand houses in and near the city of Canton have fallen down. Thus houseless and starving, the wretched inhabitants are left without any resource.

CANTON, JULY 8.—The late inundations must have caused great destruction to property in houses, furniture, and crops, and there can be no doubt that many lives have been lost. The government of China does not like to dwell upon these dreadful visitations, and the official statements never divulge the real extent of calamities by flood, fire, or earthquake. When these phenomena frequently happen, they are considered as caused by the bad government of officers of the district, whose conduct is supposed to influence the course of nature; therefore, they have a personal interest in the suppression of facts connected with such occurrences. We have made several inquiries as to the extent of damage occasioned by the late floods, but have not succeeded in obtaining any correct information. On the contrary, we know that statements grossly exaggerated have been laid before us. A short time hence, when the people recover from their alarm and losses, an account somewhat to be trusted may be had.

CANTON JULY 15.—The weather for the last three weeks has been unseasonably hot, the thermometer ranging from 90 to 96 degrees in the shade.

FROM MANILLA, BATAVIA, AND CANTON.—The ship Covington, Holbrook, arrived at Baltimore on Friday, in 142 days from Manilla. The editors of the American are indebted to the attention of Mr. G. P. Nelms, supercargo, for a

memorandum containing the information which follows:

At Manilla, when the Covington sailed, business was dull, it being too early for the season ships to make their appearance. A large portion of the old crop of sugar was on hand, which holders were anxious to realize; they could be readily obtained at \$4 1.2 per picul. Other articles of export were scarce.

Advices from Canton to the 15th August had been received. A letter of that date to Mr. N. says:—"The only news I have to give you is, that Lord Napier, the British superintendent of Trade has not been acknowledged by the Chinese authorities. By some it is supposed that a stoppage of trade will take place, but I think otherwise. Lord Napier has been deprived of his Comprador and Chinese servants, but he has stated to his countrymen that he will not allow personal insult to weigh with him; although I think he will be quick enough to take notice of the first insult offered to the trade. Two British frigates have just arrived. The Logan, Capt. Baneroff, from Gibraltar, is the last American arrival. Dr. Morrison of Macao, is dead. All your countrymen and Macao friends are well."

The advices from Batavia are to the 24th September. They communicate the melancholy intelligence that Mr. LATMAN and Mr. MUNSON, the two American Missionaries who embarked in March last from Batavia to Sumatra, were murdered and eaten by the natives of the Batta country, in the interior of Sumatra, on the 28th July last. Their bereaved widows were still at Batavia, waiting anxiously for an opportunity to return to their native land.

FROM CENTRAL AMERICA.—Guatemala papers to Oct. 14th, received at New Orleans, represent every thing at that time quiet. San Martin and Flores, who attempted to renew the civil war in the State of San Salvador and Nicaragua, were completely routed by Morazan, and compelled to desist from their purpose. This victory of the federal troops, says "El Mississippi," a Spanish paper in New Orleans, will doubtless convince this feeble faction of the superiority of the federal government, both physical and moral.

#### Common Schools.

##### ANNUAL REPORT OF THE SUPERINTENDENT.

On the 7th inst., the Secretary of State presented to the Assembly his annual report as Superintendent of Common Schools. The following extracts embrace some of the most interesting matters which it contains. A complete view of the condition of the common school system, however, can only be obtained by a perusal of the entire document.

##### 1. The condition of the Common Schools

There are in the state, fifty-five organized counties, containing eight hundred and thirty-five towns and wards. The commissioners of common schools of the several towns, are required to make an annual report of all the school districts in their respective towns, to the clerk of the county to which they belong; and it is the duty of the county clerk to send certified copies of all such reports to the Superintendent of Common Schools. This duty has been performed in every instance, and the necessary returns have been received from every town and ward in the state.

By the table marked B, it will appear that there were in the state on the last day of Dec. 1833, nine thousand eight hundred and sixty-five organized school districts, from nine thousand three hundred and ninety-two of which reports have been regularly made to the commissioners of common schools.

In the districts from which reports have been received, schools have been kept an average period of eight months.

The whole number of children over five and under sixteen years of age, residing, on the last day of December, 1833, in the districts from which reports have been received, was five hundred and thirty-four thousand and two; and the whole number of children who had received instruction in the same districts during the year 1833, was five hundred and thirty-one thousand two hundred and forty. The exact average pe-

riod of time during which the whole number of children taught have attended school cannot be ascertained. The reports show only how long the schools have been kept open, and how many children during that period have received more or less instruction.

The average number of organized districts to each town, is twelve and a half; and the number of children receiving instruction, compared with the number of school districts from which they were reported, will give an average of fifty-six and a fraction to each district.

##### II. Estimates and Expenditures of the School Money.

By the reports of the commissioners of common schools, it appears that the sum of three hundred and fourteen thousand eight hundred and eight dollars and thirty-six cents was paid by them to the trustees of the several school districts, in April, 1834. The amount of public money expended by the said trustees in the year 1833, was three hundred and sixteen thousand one hundred and fifty-three dollars and ninety-three cents; of which sum, one hundred thousand dollars was received from the Common School Fund, one hundred and ninety seven thousand six hundred and fourteen dollars and thirty-seven cents, was levied by taxation upon the property of the inhabitants of the several towns and cities of the state, and eighteen thousand five hundred and thirty-eight dollars and fifty-six cents, was derived from the local funds belonging to particular towns.

By the abstract marked B, it will be seen that the amount paid for teachers wages, besides public money, is three hundred and ninety-eight thousand one hundred and thirty-seven dollars and four cents and exceeds by the sum of twenty-eight thousand four hundred and forty dollars and sixty-eight cents, the amount paid for teachers' wages, besides public money, in 1832. The whole amount paid for teachers' wages is seven hundred and fourteen thousand two hundred and ninety dollars and ninety-seven cents, from which should be deducted a few thousand dollars expended by the Public School Society in the city of New York for school houses.

The whole amount of money, therefore, expended for teachers' wages in 1833, exceeds the amount so expended in 1832, by the sum of thirty-six thousand eight hundred and sixty-one dollars and fifty-three cents.

During the year ending on the 30th September, 1834, the productive capital of the Common School Fund has been increased by the sum of thirty-six thousand two hundred and seventy-four dollars and ninety-three cents; and it now amounts to one million seven hundred and ninety thousand three hundred and twenty-one dollars and seventy-seven cents. The actual receipts on account of revenue during the year ending on the 30th September, 1834, amount to one hundred and four thousand three hundred and ninety dollars and seventy-eight cents. Document D exhibits the increase and diminution of the fund during the same period. The several items of which the fund is composed, will be found in the paper marked E, together with an estimate of the revenue and the actual receipts on account of revenue for the same year, and a detailed estimate of the revenue for the year ending on the 30th September, 1835, amounting to one hundred and eight thousand four hundred dollars.

In 1833, the Superintendent made an estimate of the sum expended upon the common schools during the year 1831. Assuming the basis of that estimate to be true, the expense of the Common School system in 1833, would be as follows:

Interest at 6 per cent. on \$2,116,000 invested in school houses,	\$186,960 00
Annual expense of books for 531,240 scholars, at 50 cents each,	265,620 00
Fuel for 9,580 school houses, at \$10 each,	95,800 00
Public money, as appears from the returns,	316,153 93
Amount paid for teachers' wages, besides public money, as appears by the returns,	398,137 04
	\$1,262,670 97

This estimate does not, it is believed, exceed

the actual expense of the common school system, as there are several items, (of these is the expense of keeping school houses in repair,) which, from their uncertainty, have not been admitted into the estimate.

It would appear, therefore, that the whole amount expended on the schools in 1833, was one million two hundred and sixty-two thousand six hundred and seventy dollars and ninety-seven cents. Of this amount, the common school fund paid one hundred thousand dollars, a little less than one twelfth part; a little more than two-twelfths were levied by tax upon the towns and cities, with the exception of \$18,588 56, derived from local funds; something less than three twelfths was paid by taxes levied upon the school districts by vote of their respective inhabitants; and more than six twelfths was voluntarily paid by the parents and guardians of children receiving instruction.

Thus it appears that three quarters of the whole amount annually expended upon the common school system of the state, is paid by taxes imposed upon themselves by the inhabitants of school districts, or by voluntary contributions of the parents and guardians of children receiving instruction.

The third division of the Report gives a detailed account of all the receipts into the Treasury on account of the School Fund during the year ending the 30th Sept. 1834, a statement of the various items, in which the fund is invested, &c. &c., which for want of room we are compelled to omit.

#### IV. Organization of the Common Schools.

The administration of the Common School system, in all matters enjoyed by statute upon those who are charged with its supervision and management, has attained as great a degree of regularity as is practicable. Returns have been received from every town in the state, and, with a single exception, through the channels prescribed by law. In the case referred to, the report of the commissioners of common schools having been accidentally retained until the time for sending it to the county clerk had passed by, was transmitted directly to the superintendent. The matter contained in the report now submitted to the legislature by the Superintendent, has been furnished through the agency of more than thirty thousand individuals; and of all the school districts in the state, nineteen out of twenty have made their reports in the manner required by law to enable them to participate in the benefits of the Common School Fund.

The extent of common school instruction in this State, so far as it relates to the number for those on whom its benefits are bestowed, admits of little if any change for the better. In this respect our system need not shrink from a comparison with any other. When considered under all its aspects, and particularly with a reference to the training of teachers, the Prussian, is perhaps superior to every other. But in regard to the number of those whom it embraces, it falls short of ours. In 1831, the inhabitants of Prussia amounted, exclusive of the army, to 12,780,745 souls. The number of scholars receiving instruction during the same periods in different public schools, was 2,047,352. Thus it appears that one in every 622 of the whole population, was, in that year, receiving instruction.

The population of this State, according to the census of 1830, amounted to 1,919,132. If the rate of increase from 1830 to 1833 was equal to the rate of increase from 1825 to 1830 the population of the State in 1833 was 2,101,000. During the same year, the number of children actually receiving instruction in the common schools amounted to 531,240. It therefore appears that one in every 395 of the whole population in this State, was, in 1833, receiving instruction in the common schools alone.

The incompetency of teachers is still the great evil of the common school system of this State, and it may, indeed, be said to be the source of the only other material defect, which pertains to it—a low standard of education in most of the schools. The evil, however, is by no means universal. There are many teachers of ample qualifications, and many schools of high standing, both as regards the nature and extent of their requirements. The only cause of regret

is, that this is not the character of all. The principal obstacle to improvement is the low wages of teachers; and as this is left altogether to be regulated by contract between them and their employers, there would seem to be no effectual remedy for the evil but to inspire the latter with more just conceptions of the nature of the vocation, and its high responsibilities, and of the necessity of awarding to those who pursue it, a compensation in some degree suited to its arduous duties and requirements. So long as the compensation of teachers is on a level with that which is commanded by the most ordinary employments it is not to be expected that men of the necessary talents will prepare themselves for the business of teaching; but it may be justly said, that there is scarcely any vocation, in which the best talents can be employed to greater advantage. It has certainly not been common to assign to it a value at all commensurate with its importance; and it must be confessed, that while its end was to teach reading and writing and a few elementary rules in arithmetic and grammar, there was some reason to undervalue it. But on this subject more just views begin to prevail. However narrow the limit of instruction, it is obvious that the mere association of a teacher with pupils, who are at an age best fitted for the reception of strong and durable impressions, cannot fail to exert an influence upon their minds for good or evil, which may determine the complexion of their whole lives. Whatever the design may be, schools must, from the necessity of the case, be instrumental to the formation of moral as well as intellectual character; and it is of vital importance that the moral qualities and habits of the instructor, independently of his ability to teach, should, at least, carry with them no lessons of evil. But to enable him to discharge his duties in a manner suited to their great purposes, he should be fitted by his disposition and acquisitions to give a proper direction to the moral sentiments, to bring into activity the intellectual faculties, to lay open those rich stores of knowledge, which are to be found in the nature of man and in the external objects by which he is surrounded, to create a spirit of inquiry and observation, and teach its application to practical uses. To accomplish these results, a high grade of qualification is indispensable; but nothing less, it may be safely assumed, will satisfy the existing desire for rational improvement or keep pace with the advances of science and the progress of just opinions. In order to command the services of men competent to discharge this elevated trust, an adequate compensation must be provided for them; for it cannot be expected that any occupation, excepting such as confer influence or distinction, will invite to it talent and skill without the promise of pecuniary rewards proportioned to its labors and sacrifices. Before the evil referred to can be wholly eradicated, a change must be wrought in public opinion; and it is believed that such a change is already in progress, and that it may be accelerated by measures, which are now under the consideration of those who have the power to adopt them. During the last session of the Legislature, a law was passed authorizing the Regents of the University to apply a portion of the revenue of the Literature Fund to the education of Common School Teachers; and it is understood that a plan will be matured, at an early day, to establish departments of instruction and discipline for the purpose, in connection with some of the organized academies. The execution of such a plan will but carry out a policy which was distinctly recognized by the Legislature in 1827, when the capital of the Literature Fund was augmented, to use the language of the law, in order "to promote the education of Teachers," although the design of the law was not sustained by the measures necessary to give it the form and effect of a system. Should these departments succeed in preparing for the Common Schools, a supply of well trained Teachers, it is believed that the influence, which the latter may exert upon the public mind, by the superiority of their methods of instruction over those in common use, will do much to bring about that change of opinion which is indispensable to the perfection of our system of popular education.

If the foundations of our whole system of public instruction were to be laid anew, it would perhaps be advisable to create separate seminaries for the preparation of teachers, although from the nature of our institutions it might be deemed arbitrary, if indeed it were practicable, to compel the school districts to employ them. It would be equally difficult without a great augmentation of the Common School Fund, to present to the districts a sufficient pecuniary inducement to engage the individuals thus prepared; and it may be safely assumed that nothing short of a thorough conviction in the public mind that common school teachers are in general incompetent to the proper fulfilment of their trusts, and that the standard of education is extremely imperfect, would accomplish the object. If that conviction can now be created, the existing evils may readily be redressed.—Our common school system is so perfectly organized, and administered throughout with so much order and regularity, and so many academies under able management are already established, that it would seem the part of wisdom to avail ourselves of these institutions to the extent of their capacity, for the purpose of training teachers for the common schools. Their endowments, their organization, the experience and skill of their instructors, and their whole intellectual power may be made subservient to the public purpose in view, and with the aid which the State can lend, much may be effected. But whatever differences of opinion may prevail, with regard to the foundation of this plan in sound policy, the question has been settled by the legislature; and it remains only to carry it into execution with proper energy. Should it prove inadequate to the ends proposed, a change of plan may then be insisted on, without being open to the objection of abandoning a system which has not been fairly tested.

It may not be improper to remark in this place that the necessary connexion which exists between our common schools and the literary institutions of the state, including those of the highest grade, has been too frequently overlooked.—The academies have already been, in effect, without receiving from the state any direct pecuniary aid for the purpose, nurseries for common school teachers. The great body of those, who have either temporarily or permanently devoted themselves to teaching have been prepared at the academies with a view to that occupation, or to some professional employment. The instructors in the academies have in their turn, been educated in the colleges; and but for the latter, or some other system of classical and scientific education as a substitute for the course of training pursued in the colleges, the academies would obviously be destitute of the necessary supply of tutors.—Thus, all our incorporated literary institution minister to the improvement of the common school system, on which the great body of the people are dependant for their education. It is true, that colleges are apt to be regarded as aristocratic institutions, beyond the reach of the poor, and therefore beneficial only to the rich. But independently of the indirect benefit already referred to as resulting from them, it is believed that this prejudice will be found, on a close inspection, to be founded wholly in error. Men of fortune are obviously independent of them; for, however convenient they may be, wealth can always command the services of talent, and children of those who can afford the expense, may be educated at home or in private schools. But this expense, is altogether beyond the ability of individuals in ordinary circumstances. A man of little property may be able to educate his child in an institution, which, by reason of its endowments, can fix the charge for tuition at very reasonable rates. If the institution is so near that children can board at home, it is brought within the reach of an additional number. Indeed, many young men, altogether without property or pecuniary assistance from their friends, succeed now in gaining an education at college by their earnings during vacations. In the endowment of Union College, provision was made by the Legislature for indigent students. In the year 1823, books were furnished gratis for all who were unable to provide them, and seventy-three young men were "otherwise" assisted from the fund

granted by the State for the purpose." It may be justly said that colleges are not necessary to the rich, but that they are to persons in ordinary circumstances of the greatest value. They serve to abolish the most important distinction which can exist under our political institutions and laws—the distinction between the educated and the uneducated—and they enable those, who are destined to rely on their own unassisted efforts, to enter into competition in the highest intellectual fields of enterprise, with those who have been sustained by the adventitious aids of wealth.

Whatever doubts may have been entertained with regard to the beneficial effects of institutions, sustained wholly or in part by Government patronage, for the higher departments of education, none, it is conceived, can reasonably exist in relation to our colleges on their present footing. None of them are so highly endowed as to be able to dispense altogether with the contributions from their pupils; they are generally dependent in a very great degree on public patronage for their support; they derive no regular income from the State Treasury; the same competition, which prevails in the ordinary transactions of individuals engaged in the pursuit of a common object, is so strongly felt by them, that professors without talents and industry will find no place in them, and the course of studies must necessarily take its complexion from the public wants, and cast off every thing, which is either useless or repugnant to the prevailing spirit of society.

But it is principally as accessory to the great objects of common school instruction, that our colleges and academies deserve to be cherished—as nurseries for those through whose instrumentality the standard of popular education must be raised to its proper elevation.

When measures shall be taken to train in the organized academies such a supply of competent teachers as to provide each town in the State with a few good schools, the contrast between the improved methods which will be introduced into them and those which are in common use, can hardly fail to produce in neighboring districts a spirit of emulation, which will gradually bring the schools established in them to the same standard. Imperfect as are many of our common schools, they are, it may be confidently based, in better condition than they have been at any previous time. The standard of education in general has gradually advanced, though very slowly. But in some schools a high degree of excellence has been attained, and within the sphere of their influence improvements are springing up in others. In districts where the advantages have not had the opportunity of witnessing the beneficial effects of better methods of instruction, it is natural that they should be content with those to which they have been accustomed. But the good sense which the people carry into their ordinary transactions, will in this matter, as in all others, guide them to correct conclusions when the benefits of improved, and the evils of defective methods, are brought home to their observation. As the demand for competent teachers is augmented, and such wages are offered as to ensure their services, the number of those who prepare themselves for the business of teaching, will increase in a like proportion. The higher departments of instruction for teachers to be established in the existing academies, as is contemplated, and the plan prove efficient and become popular, it may be readily extended so as to be commensurate with the wants of the whole State.

For the purpose of the measures necessary to the perfecting of our common school system we must rely mainly on the intelligence of the people. To suppose that they are incapable of forming a just estimate of their true interests, or that, estimating them properly, they will be unwilling to do what is necessary to secure them, would be an impeachment of their good sense, which is not warranted by experience, and which, if admissible, would also impeach the wisdom of our whole political organization. Experience shows that the people require only to be furnished with the proper means of observation to judge rightly.—In the vicinity of the St. Lawrence academy, in which a system of lectures on the principles of

teaching has been regularly delivered to a numerous class, during the last three or four years, the average rate of compensation for teachers has advanced about three dollars per month.—The school districts enter into competition with each other to procure the teachers prepared at the institution, which has been wholly unable to supply the demand. The teachers educated at the Andover Seminary, in Massachusetts, command readily a compensation for their services, which enables them to devote themselves to teaching as a permanent vocation. The same effects which have been produced in the neighborhood of the St. Lawrence academy will be visible elsewhere, when the same opportunities of observation are presented; and when the training of teachers is reduced to a system, and the standard of education in a few schools is raised to its proper elevation, the sound judgment and liberality of the great body of the people may be safely relied on for the extension of these improvements to every part of the State.

It has, indeed, been said that in establishing systems of public education the government, and not the people, must give the impulse. But, however true the observation may be of other countries, experience has shown that it has no application to our own. The foundations of the common school system, which exists under different modifications of form throughout the northern and eastern States, were in most cases laid by the people, without the aid of the public authority. If there is any one sentiment with respect to our social condition which has prevailed more generally than any other from the earliest times, it is a deep rooted conviction of the importance of education for all classes. With regard to the extent to which intellectual cultivation should be carried in the common schools, opinion has certainly not kept pace with the progress of improvement in other matters; but as has been already suggested, the evil has grown out of the imperfect methods of instruction in common use; and in order to secure the correction of the evil, the necessary improvements in common school instruction must be brought under the same intelligent observation in which the foundations of the system were laid. If this be done, it is believed that no compulsory measures will be necessary to insure their adoption.

It was for a long time contended by the most profound writers, that the support of religious societies could not be safely entrusted to the voluntary contributions of the people. But our experience has completely overturned the arguments on which this fallacy is founded; and it gives us the strongest assurance, that the same enlightened sentiments which have so liberally sustained the established systems of religious worship and instruction, will with equal liberality, sustain those systems of early moral and intellectual cultivation, without which the generations to succeed us, would neither be fitted to discharge their duties to themselves, to their country, nor to the Power on whose providence depend the destinies of all.

In the last annual report of the Superintendent, he stated briefly the principal branches of study which were deemed essential to every individual, in order to fit him for the discharge of the duties of citizenship. The importance of the subject, and the increased attention which popular instruction has recently attracted, will, he trusts, be deemed by the legislature, a sufficient apology for repeating the enumeration then made, though no legislative action is required.

**Grammar.**—So much as is necessary to a correct comprehension of the different parts of speech, and such a course of exercises in parsing as shall render the student familiar with the practical application of the rules which govern their relation to each other. This branch is usually commenced too early; and much time expended to little or no purpose.

**Geography.**—A thorough knowledge of the geography of the state of New York and of the United States, and so much of the geography of the earth, political as well as physical, as treats of its general divisions of climates, soils, and productions, and such elementary statistics as are usually, grafted upon geographical works.

**History.**—A familiar acquaintance with the

history of the United States; and the elements of general history.

**Arithmetic.**—The usual course as far as and including the Rule of Three. To this course should be added the elements of geometry.

**Civil and Criminal Jurisprudence.**—A few practical rules of the former, and so much of the latter as points out the offences to which penalties are annexed by law. These may be compressed into a very narrow compass.

**Constitutional Law.**—The form of government and the fundamental principles of Constitutional law. A knowledge of these may be best obtained by studying the constitution of the United States and the constitution of the State of New York.

**The duties of public officers.**—So much as relates to our state, county and towns officers.—A brief and well executed treatise on this subject has already been prepared and published.

These subjects may be studied without difficulty, and without adding to the time necessarily devoted to elementary instruction, by retrenching from others, which occupy too much attention.—A great deal of time is lost by commencing the study of grammar at too early an age, and committing to memory abstract rules, the reason of which is altogether above the comprehension of the learner. The result is, that time is mispent, and there is danger also, that a distaste may be created for study by tasking the mind with acquisitions which it cannot understand, and in which it feels no interest. The memory may be more advantageously exercised in treasuring up useful knowledge, on a level with the capacity of the learner; and by directing the attention to subjects which awaken interest, application ceases to be a task.

The introduction of such improvements into the common course of school instruction as will make it equal to its high purposes is an object which may justly claim the countenance and co-operation of all classes. On our common schools we must rely to prepare the great body of the people for maintaining inviolate the rights of free men. If the political fabric cannot find in the public intelligence, a basis broad and firm enough to uphold it, it cannot long resist the shocks, to which, through the collision of contending interests it is continually exposed. Forty-nine out of every fifty of our citizens, receive their education in the common schools. As they advance to manhood, they are, for the most part, devoted to manual employments. Looking to their own industry as their only resource and to its fruits as the boundaries of their personal desires, the object nearest their hearts is to see their country prosperous, the laws administered with order and regularity, and the political importance, which the constitution has secured to them, maintained undiminished. The controversies to which conflicting interests give birth, are to be put at rest by their decisions. In the questions of policy, which are presented to them constitutional principles are frequently involved, and the relation they bear, and may in all future time bear to the government, is directly or indirectly affected. How important is it that these decisions should be as enlightened as they will be honest; that with every motive to be upright and conscientious in the exercise of their political rights, they should combine also the capacity to maintain them with independence and discretion! If they shall ever cease to bring to the settlement of these great questions a sound and enlightened discrimination, they cannot fail to become the dupes of artful leaders and their country a prey to internal discord.—From the genius of our political institutions, popular education is our only security against present and future dangers. Ignorance is said to be the parent of vice. With us it would also be the parent of those fatal disorders in the body politic, which have their certain issue in anarchy.

Happily, our system of public instruction embraces within it almost all, who are capable of participating in its benefits. Our only remaining duty is therefore, to provide, that it shall not, at any future day, be reduced to narrower limits, and that the standard of education shall be so advanced as to secure the highest possible degree of intellectual cultivation.

Lord Brougham lately expressed his surprise to a public deputation, that any one could doubt of the vast superiority of Mutual Instruction, in elementary schools, and particularly for the children of the Poor.—[National Gaz.]

**Value of Time.**—It is said that a man who had accustomed himself to seize a pen whenever his wife was putting on her shawl and bonnet to walk, found, before he suspected such a result, that he had written a tolerable book. Wonders may thus be accomplished by all in their stray moments, would they but improve them. I would not prevent people from reflecting, from resting, or enjoying themselves; but the worst of it is, many waste large portions of their lives without doing any of these. Circumstances favor persons thus bent on rational employment. Instead of idling away a half hour before dinner, or some appointment, if they take up a book or a pen, or undertake to do any little duty which demands their attention, they find often the time which they might have frittered away, much longer than they anticipated. Many a friend might be secured or obliged by a letter written at these intervals, by those who profess to have "no time." We all have "time," more or less, which might be devoted to the performance of neglected duties.—[Transcript.]

**Asking Favors.**—Many persons boast an independence in which I cannot sympathize. They pipe themselves upon never asking a favor of any one. If it be the token of no worse characteristics, this habit is the sign of an unreflecting mind. Why, they are perpetually receiving favors, not only from Providence but from their fellow creatures, without whose kindness they could scarcely exist.

#### NOTICE TO MARINERS.

**New Light-house of Barfleur, Department of La Manche.**—Navigators are notified that from and after the 1st April, 1835, the Fixed Light of the ancient turret of Barfleur, situated five marine leagues E. & NE of Cherbourg, will be suppressed and replaced by a Revolving Light, which will be lighted up on the turret recently constructed, 61 metres 8.35 17' W. of the old light, and 73 metres above the level of the full equinoctial sea. Its light will appear regularly every half minute throughout the night—in fine weather, it will be visible at the distance of 8 marine leagues and the eclipses will only appear total at a distance of more than 4 leagues.

#### MECHANICS' MAGAZINE.

**THE NUMBER FOR DECEMBER**, which completes the fourth volume of this popular work, is published. It contains a portrait, engraved on copper of **ROBERT FULTON**, with a Memoir, and some documents respecting his claim to the honor of first originating steam navigation. Also, upwards of 50 articles of interest and utility, connected with the arts and sciences.

The first number for 1835 will be ready very shortly. Subscribers who are deficient of numbers can be supplied, as the work is stereotyped.

The *Mechanics' Magazine and Register of Inventions and Improvements* is published by the Proprietors, D. K. MINOR & J. E. CHALLIS, at No. 35 Wall-street, New York: in weekly sheets of 16 pages, at 64 cents—in monthly parts of 64 pages, at 34 cents—in volumes of 84 pages, in cloth boards, at \$1.75—or at \$3 per annum, in advance. JOHN KNEZT, (formerly proprietor of the London *Mechanics' Magazine*), Editor.

#### AGENTS FOR NEW PUBLICATIONS.

**HENRY G. WOODHULL**, of Wheatland, Monroe county, New York, is agent for the following Publications: The New York American Daily, at \$10.00—Tri-Weekly, at \$5.00—Semi-Weekly, at \$4.00 in advance.

The American Railroad Journal, Weekly, at \$3.00 per annum.

The Mechanics' Magazine, two volumes a year, at \$3.00 per annum.

The Quarterly Journal of Agriculture and Mechanics, at \$5.00 per annum, or \$1.25 per number.

The Family Magazine, 416 pages a year, at \$1.50 in advance.

The Monthly Repository and Library of Entertaining Knowledge, of 36 pages a month, at \$1.00 in advance, now in the 5th volume, bound volumes \$1.25.

The Ladies' Companion, of 54 pages a month, at \$3.00 per annum, in advance.

The Rochester Gem, at \$1.50 in advance.

All Communications addressed to me, at Wheatland, Monroe county, will be promptly attended to. September 19, 1834.

**TOWNSEND & DUFFEE**, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of *Duffee, May & Co.* offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. R. Co. Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania.

Hudson, Columbia county, New-York, January 30, 1835.

#### RAILROAD CARS.

Messrs. D. & J. MITCHELL, Solihoe Foundry, Helli daystburgh, Huntingdon county, Pennsylvania, are now prepared to manufacture, at short notice, any number of Railroad Cars—in the most approved and substantial manner. Jan. 24 t

#### SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by

E. & G. W. BLUNT, 184 Water street, corner of Maidenlane.

J31 6t

#### SURVEYING AND ENGINEERING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG, Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested. Baltimore, 1835.

In reply to thy inquiries respecting the Instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all Instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,  
JAMES F. STABLER, Sup't of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1835.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

German town, February, 1835.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.  
German town and Norrist. Railroad

#### ALBANY SEED STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1835, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, white Mulberry Seed, genuine Mangel Wurzel, Yellow Lucern, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORBURN,

347 N. Market st. (opposite Post Office.

Catalogues may be had at the Store; if sent for by mail will be forwarded gratis. Orders solicited early, as the better success can be done in the execution.

\* Mr. Thorburn is also Agent for the following publications to wit:—New York Farmer and American Gardener's Magazine; MECHANICS' MAGAZINE and Register of Inventions and Improvements; AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the New-York AMERICAN, Daily, Tri-Weekly, and Semi-Weekly: either of which may be seen and obtained by those who wish them, by calling at 347 North Market st., Albany.

#### STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads,

No. 264 Elizabeth street, near Bleecker street, New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation. J35 tf

#### RAILROAD CAR WHEELS AND BOXES, AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to.

Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

#### PATENT HAMMERED SHIP, BOAT, AND RAILROAD SPIKES.

Railroad Spikes of every description required, made at the Albany Spike Factory.

Spikes made at the above Factory are recommended to the public as superior to any thing of the kind now in use. Ship and Boat Spikes made full size under the head, so as not to admit water.

Orders may be addressed to Messrs. ERASTUS CORNING & CO., Albany, or to THOMAS TURNER, at the Factory, Troy, N. Y. sept. 18-1y

#### RAILWAY IRON.

Ninety-five tons of 1 inch by 1 inch.	Flat Bars in Piles of 14 to 16 ft. each.
360 do. 1 1/2 do. do.	1600' sunk holes ends cut
40 do. 1 1/2 do. do.	at an angle of 45 deg's with
800 do. 2 do. do.	splicing plate, nails to suit.
800 do. 2 1/2 do. do.	soon expected.

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rails of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 24, 28, 32, 36, 40, and 44 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment. A. & G. RALSTON.

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them. 471mewr

#### MILL DAM FOUNDRY FOR SALE,

The Proprietors of the Mill Dam Foundry offer for sale or lease, their well known establishment, situated one mile from Boston. The improvements consist of

No. 1. *Boiler House*, 50 feet by 30 feet, containing all the necessary machinery for making boilers for Locomotives and other steam Engines.

No. 2. *Blacksmith's Shop*, 50 feet by 30, fitted with cranes for heavy work.

No. 3. *Locomotive House*, 54 feet by 25, used for putting together Locomotive Engines. Several of the best Engines in use in the United States have been put in this establishment.

No. 4. A three story brick building, covered with slate, 130 feet by 45, containing two water-wheels, equal to 40 horse power; Machine Shop, filled with lathes, &c.; Pattern Shop; Rolling Mill and Furnaces, capable of rolling 4 tons of iron per diem, exclusive of other work; three Trip Hammers, one of which is very large; Engine for blowing Cupola Furnaces, moved by water-wheel; one very superior 19 horse Steam Engine, which could be dispensed with; and a variety of other machinery.

No. 5. An Iron Foundry, 60 feet by 45, with a superior air Furnace and two Cupolas, Co-oven, Cranes, &c. fitted for the largest work. Attached to the Foundry is a large ware-house containing Patterns for the Castings of Hydraulic Presses, Locomotive and other Steam Engines, Lead Mill Rolls, Gearing, Shafts, Stoves, Grates, &c. &c. These were made of the most durable materials, under the direction of a very scientific and practical Engineer, and are supposed to be of great value.

No. 6. A building, 65 feet by 35, containing a large stock of chimneys, and furnaces, for making Cast Steel. This building is at present used as a boarding-house, and can accommodate a large number of men.

No. 7. A range of buildings, 200 feet long by 35, containing counting room, several store rooms, a Brass Foundry, room for cleaning castings, a large loft for storing patterns, stable for two horses, &c. &c.

The above establishment being on tide water, presents greater advantages for some kinds of business than any other in the United States. Coal and Iron can be carried from vessels in the harbor of Boston, to the wharf in front of the Factory, at 25 to 30 cents per ton. Some of the largest jobs of iron work have been completed at this establishment; among others, the great chain and lift pumps for freeing the Dry Dock at the Navy Yard Charleston.

The situation for Railroad work is excellent, being in the angle formed by the crossing of the Providence and Worcester Railroads. The Locomotive "Yankee," now running on the latter road, and the "Jonathan," purchased by the State of Pennsylvania, were built at these works. With the Patterns and Machinery now in the premises, 12 Locomotives and as many tenders, besides a great quantity of cars and wagons, could be made per annum.

For terms, apply to

THOS. J. BOKLEY, Treas'r. &c., Boston, or to ROBERT RALSTON, Jr., Philadelphia, Boston, Dec. 30, 1834.

# AMERICAN RAILROAD JOURNAL, AND ADVOCATE OF INTERNAL IMPROVEMENTS.

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, JANUARY 31, 1835.

[*For* We would ask particular attention to the Report of the different Committees appointed by the Baltimore Internal Improvement Convention, and, in short, to the whole Journal. It contains matter for serious reflection by all who feel an interest in the continued prosperity of this city, or state.

**NEW-YORK AND ERIE RAILROAD.**—After years of anticipation of the benefits, and estimation of the cost, and doubt, by many, even of its friends, of the success, of this great work, we now have something before us upon which we may rely. The Report of BENJAMIN WRIGHT, Esq., who was appointed by the Governor, under an act of the Legislature, to make the survey, which was made on Thursday, 20th inst., to that body, is far more favorable, and presents much fewer obstacles, than was anticipated. We had heard much of the favorable route ascertained by the engineers, but the most sanguine friends of the work could not have anticipated one with so few and moderate elevations to overcome.

This report will do great credit to the able and so justly celebrated engineer whom the survey was entrusted; and to his assistants, Mr. James Seymour, and Mr. Charles Ellet, each of whom had charge of one of the grand divisions, as well as to those who composed their respective corps, for their industry and perseverance in accomplishing a survey and estimate so extensive, in a period so limited. By this report it will be seen that the obstacles, heretofore considered insurmountable, are by no means equal to those overcome by our neighbors of Pennsylvania, and of Maryland. They will not, we feel confident, delay for a single day, the progress of the work. And it is to be hoped that the information now before the Legislature will insure its favorable action upon the application of the company, for the aid of the State.

The New-York and Erie Railroad can only be considered as a great national work. It will be as great an improvement upon the present, as it is upon that mode of com-

munication in use before the construction of the canal. The canal reduced the cost of transportation in the proportion of 100 to 25 dollars per ton, and the time as 18 to 6 days, from Albany to Buffalo. The railroad will produce an equal improvement upon the present mode of traveling, and the transportation of light and valuable freight—only the order will be reversed, thus: the time will be reduced as 4 to 1, and the cost as 2 to 1, or thereabouts. In these estimates we may not be precisely, to the penny, correct; but we are in the main correct, and are willing to risk the little, whether it be of reputation or of property, we possess, on the result, if the work shall be speedily and properly constructed. Upon these two points, however, and especially the first contingency, rests the success, not only of this, but of ALL the great works of internal communication, whether now in use, or in contemplation in our State.

By the reports of two committees appointed by the Internal Improvement Convention, held at Baltimore, which will be found in this number of the Journal, it will be perceived that there is an untiring spirit of honorable enterprise pervading, and which does great credit to, the States interested in the works now in course of successful construction south of us; which, if permitted to take, will for a long time retain, the lead of us in such works; and will also divert from us a great share of that immense and rich trade which we have claimed as our right—which right, however, will be found, when too late for us to enjoy it, to be vested only in those who had the prudent foresight to secure it, not by acts of legislation only, but by acts of ENLIGHTENED POLICY and persevering industry, worthy of an age of statesmen and patriots.

With a climate more favorable, and little over one half the distance to construct their works, Maryland and Virginia will at no distant day divert to their seaports much of the produce of the fertile country west of the Alleghenies; which, with an easy, cheap, and, above all, speedy means of reaching this port, would certainly come here; and, when they purchase the produce of the West, they will assuredly supply them with those articles of convenience and luxury which are now mostly obtained in New-York. Does it not then become the imperative duty of our citizens, and especially of the present Legislature, to adopt such measures as will secure to us the benefits

we now claim as our own; and which, by the favorable topography of our state, we may do, (notwithstanding the advantage of our neighbors in climate and distance,) if we construct a continuous line of railroad to Lake Erie, and thereby obviate the great difficulties under which we now labor for more than one third the year? As a matter of policy, at least, if not as an act of justice, to many of our own citizens, we think the Legislature should act promptly and liberally in this matter.

There is another reason to be urged in favor of prompt action by our Legislature. Not only are Pennsylvania and Maryland moving shoulder to shoulder in the cause of internal improvements, but Virginia is also aroused from her long sleep. She has witnessed within her own territory the benefits of a railroad, a circumstance which we, two years ago, predicted would be worth to her citizens five years of argument and speculation; and she is now disposed to remedy the evils of her long delay, and has come forward and taken such a share in the stock of the contemplated James river improvement as will ensure its success; and we hold it certain, that if that work should be made into the valley of Virginia, and the New-Orleans and Nashville road, now under survey, and said to be through one of the most favorable routes in the world, also completed, before the New-York and Erie road is commenced, the great railroad thoroughfare from Boston to New-Orleans, will never pass through the interior of New-York, but must, beyond question, find its way through Washington City, and the Valley of Virginia, or further south, and connect with the New-Orleans road at Nashville; whereas, if we forget sectional feelings and self-interest, and look only to the general good, we may secure the benefits of this great thoroughfare, and by continuing it through the corner of Pennsylvania to Ohio, and connect with the Med river Railroad, we may then with little difficulty connect with the New-Orleans and Nashville road, as we understand that charters will be granted this winter, both in Kentucky and Tennessee, for its continuation to Louisville, thus holding out to us the right hand of fellowship, and the offer of their best efforts to make the city of New-York the depot of the produce of their soil. Shall we slight the offer to gratify private interest, or sectional feeling? We think not.

On Thursday last, on motion of Mr. CARR, eight times the usual number of copies of the report of Judge WATSON, of the survey of the New-York and Erie Railroad, were ordered to be printed, and 100 additional copies for the use of the engineer.

*Report of BENJAMIN WRIGHT, Esq., Civil Engineer, who was appointed by the Governor to Survey the Route of the New-York and Erie Railroad.*

To JOHN A. DIX, Esquire,  
Secretary of State:

SIR:—His Excellency the Governor having been pleased to appoint me to execute the survey, and make an estimate of the expense of a Railroad from "at or near the city of New York to Lake Erie" under the act of May 6th 1834, which said act requires me to file the report, maps, profiles and estimates in the office of the Secretary of State:—

In conformity to said act I now present my report, maps, profiles &c., to be filed in your office, as the law directs, and beg leave hereby

TO REPORT:

That in undertaking the important and responsible duty of surveying the route of a railway communication from the Hudson river, near the city of New York, to Lake Erie, I deem it essential to keep in view the great public objects sought to be attained by the proposed work. It was obvious that the road was to be constructed, not only for the accommodation of the inhabitants of the district immediately adjacent to the route, but also in order to furnish the means of a regular, rapid and uninterrupted intercourse, at nearly all seasons of the year, between the city of New York and the extensive and populous communities upon the Western lakes and waters.

The vast and acknowledged benefits which had been experienced throughout a great part of the State, and especially by its commercial emporium, from the construction of the Erie Canal, as well in the increase of population and wealth, as in the progress of agriculture and trade, the augmented value of lands, and the rapid and unexampled growth and creation of cities, towns and villages, along the route, had plainly proved that a thoroughfare running through the southern tier of counties, and properly suited to their topographical character could not fail to impart similar advantages to that important and valuable section of country, while the pressing necessity of establishing a channel of communication within this State which should be open during nearly, or quite the whole of the winter months, and thereby remedy the evils occasioned by its high northern latitude, had not only been felt sensibly by the inhabitants of the metropolis, but had excited public attention throughout a great portion of the fertile and extensive regions upon the upper Lakes, and in the valley of the Mississippi.

The long line of counties in our own State, through which the road would pass, favored as they are with a healthful climate and an enterprising population, abounding in natural resources which the proposed work could not fail to develop, also possessed an additional importance in their peculiar topography, being intersected in numerous directions by important streams, leading into that section of the country from other parts of the State, and thereby furnishing striking facilities for connecting the proposed road with lateral

branches, capable of accommodating large masses of our population.

Keeping therefore steadily in mind these general considerations, I deemed it an incumbent duty in selecting the line of location for the proposed road, to obtain a route which as far as should be practical might combine:

- 1st. Reasonable economy in its construction.
- 2d. Rapidity and regularity of communication for passengers, light merchandize of value, and the public mail.
- 3d. Cheapness of transportation for bulky commodities.
- 4th. Facilities of connection with lateral branches.
- 5th. The general accommodation of the inhabitants, and the development of the resources, of the country along the route.

And I considered it also necessary to take into view, not only the present, but the prospective advantages of the route, and to arrange the graduation of the whole work, in reference to such further additions and improvements as might hereafter become necessary in order to accommodate a great increase of trade and transportation.

Being guided by these general outlines, I commenced the survey of the route on the 23d of May last, under the appointment which I received from his Excellency the Governor on the 21st of that month.

The work was divided into two grand divisions: of which the *Eastern* extending from the Hudson river to Binghamton, was under the direction of James Seymour, and the *Western* from Binghamton to Lake Erie, was placed under Charles Ellet, Jr., both acting as my assistants and subject to my supervision.

Those gentlemen, with my advice and approbation, each had sometimes two, and often three and four parties employed in explorations through the season. From each of them I have received separate reports, with their views of plans and description of country through which each had passed.

I take great pleasure in stating, that the surveys thus committed to their care, have been executed to my entire satisfaction, and I refer to their reports and estimates of quantities, as exhibiting the industry and skill with which their duties have been discharged.

I have personally inspected the lines surveyed nearly their whole length, and have particularly considered and examined every part of the route, at which there could be any reasonable doubt or difficulty, and we have fully advised and compared opinions, as to all prices estimated for the graduation of the work.

It is possible, and I may say probable, that the shortness of time allowed for the completion of so long a line of survey, in some instances not noticed by me, may have prevented our ascertaining the very best and cheapest route, of which some portions of the country may have been capable; but I have become perfectly satisfied from the lines already run, and minutely measured, that a feasible route has been obtained, free from formidable difficulties, and capable of being completed with economy and despatch.

A more minute and careful exploration, over some particular parts of the country, will enable the engineer to adopt very considerable alterations and improvements at many points, both as to graduation, and also the cost of the work.

The great object of securing rapidity and regularity of communication between the city of New York and the Lake, being one of paramount importance, I have studiously sought to avoid the use of stationary steam power on inclined planes, as being productive of delay, danger, expense and difficulty; and in this respect, have been so successful, that, with the exception of one single plane near Lake Erie, I have brought the whole line within the power of Locomotive Engines, drawing passenger cars, light merchandize and the public mail.

The steepest acclivity encountered on the whole line, with the exception before-mentioned, will be only one hundred feet per mile; and having been furnished with satisfactory evidence that by recent improvements in the locomotive steam engines, on the Baltimore and Ohio Railroad, they have been enabled to ascend an acclivity of one hundred and seventy-six feet to the mile, drawing between five and ten tons weight, I rely upon that fact in stating, that locomotive steam engines may be advantageously used on the whole of the proposed route, from the Hudson river to the head of the plans near Lake Erie: that they will be able to pass its steepest grades, drawing at least 70 or 80 passengers with their baggage; while upon at least nine-tenths of the whole route, they will be able to propel very great burthens at a great rate of speed.

In order, however, to obtain these easy grades of acclivity, I have been compelled to pursue, by a serpentine line, the valleys of streams, and thereby to lengthen very considerably, the linear extent of the route.

The general face of the country is undulating and marked by bold and prominent features; but, nevertheless, it is intersected by numerous rivers and their branches, which have a gentle descent, and fortunately pursue the general direction necessary for the route, in much of the distance.

It is this all-important and cardinal feature in the topography of the country, and the facilities which the valleys of those streams thus present, for obtaining gentle ascents and descents, and moderate graduation, which will explain the reason why I have been able to find a cheap and easy route, without the aid of stationary steam power, through portions of the State which, to the eye of the passing traveller, crossing as he does the numerous hills which are traversed by the ordinary stage roads, would seem to present insuperable obstacles to the accomplishment of the proposed work.

An examination of the plans and profiles returned with this report, will show that the route instead of passing directly over, goes around the hills; and that it has not been necessary to surmount any considerable acclivities, except in three or four instances, in which the line crosses the

natural boundaries of the great valleys into which the route is topographically divided.

It is true, that the departure from a straight line thus occasioned by following the winding of the water courses, has considerably lengthened the whole route between New York and Lake Erie—But when it is considered that great rapidity of transportation, and cheapness of construction have been thereby secured, and a greater portion of country accommodated; that the conformation of the country wholly forbade the adoption of any other route, more direct, without enormous expense; and that the circuit of route will be comparatively less than that of the Pennsylvania Canals, its deviation from a direct line will not be regarded as a formidable obstacle or objection.

The natural boundaries of the valleys, which are pursued by the route, will serve to subdivide it into six grand divisions, to wit:

*The First or Hudson River Division*, extending seventy-three and a half miles from a point in the Hudson river, twenty-four miles north of the City Hall of New York, to a point in the Deer Park Gap, of the Shawangunk Mountain, dividing the waters flowing into the Hudson from those flowing into the Delaware.

*The Second or Delaware Division*, extending from the point last mentioned through the valley of the Delaware and its tributaries one hundred and fifteen miles, to a summit, twelve miles N. W. of the village of Deposit, in Delaware County, dividing the waters of the Delaware from those of the Susquehanna.

*The Third or Susquehanna Division*, extending from the point last mentioned through the valley of the Susquehanna and its tributaries one hundred and sixty-three and a half miles, to a summit thirteen miles S. W. of the village of Hornellville, in the county of Steuben, dividing the waters of the Susquehanna from those of the Genesee.

*The Fourth or Genesee Division*, extending from the point last mentioned across the valley of the Genesee thirty-seven miles, to a summit three miles E. of the village of Cuba, in Allegany county.

*The Fifth or Allegany Division*, extending along the valley of the Allegany and its tributaries eighty-three miles to the head of the inclined plane, distant four or five miles from Lake Erie, on a straight line.

*The Sixth or Lake Erie Division*, embracing the short and rapid descent to the Lake, including the inclined plane and the two branches, one to Portland, nine miles, and one to Dunkirk, eight and a half miles.

It will be perceived by an inspection of the profiles, that the only points where the rates of ascent exceed 60 feet per mile, will be found on the summits above specified, as forming the boundaries of the six Grand Divisions of the route. The acclivities in passing these summits are respectively as follows:

One grade of 100 feet to the mile, in passing from the Hudson River Division, down

the west side of the Shawangunk mountain into the Delaware Division;

One of 70 feet, and one of 61 feet to the mile, in passing from the Delaware Division to the Susquehanna Division;

One of 70 feet, and one of 65 feet to the mile in crossing the ridge, between the Susquehanna and its tributary the Chenango River.

And one of 72 feet to the mile, in passing from the Susquehanna Division to the Genesee Division.

I have no doubt that all these ascents and descents above specified, may readily be surmounted by locomotive engines drawing passenger-cars, light merchandize and the mail. But in order to aid the passage of burthen cars heavily loaded, it will be necessary to station at the several points above specified, either auxiliary locomotive engines, as is practised on the Liverpool and Manchester Railroad, or an increase of animal power, as is used in passing the Parr Ridge, on the Baltimore and Ohio Road. That this can be effected without any material interruption or inconvenience, will be obvious, when it is recollected that the western slope of the Parr Ridge, on the last mentioned road, has an ascent of no less than 253 feet to the mile, an acclivity nearly three times as great as the steepest grade on the proposed route, but that it is nevertheless surmounted at all times by burthen cars heavily loaded, aided only by an increase of animal power.

It will also be borne in mind, that at least three-fourths of the heavy tonnage passing on this road, will descend eastward towards tide water. The elevation of the head of the inclined plane near Lake Erie, being 1303 feet above the Hudson River, the products of the Western country passing eastward, will necessarily descend 1303 feet more than they will ascend, and their passage will consequently be aided to that extent by their own gravitation.

It is, however, by no means impossible, that in the course of twenty years, the great increase of the population and agricultural products of the interior, and the necessity of expediting their passage to market, may render it expedient and economical to adopt additional tracks with a compound moving power and grades reduced in all cases to 30 feet per mile, with stationary engines, operating on inclined planes, and located at intermediate points along the road. In that event, the entire change might be effected along the whole line, without altering more than thirty or forty miles of the Road.

And although I do not believe that this change will ever be made or become necessary, except in the event of so great an increase of trade as to make steady uniform power the best, in which case I believe that stationary power applied on the present grades would be found the best, and used as Messrs. Walker & Rastick proposed on the Liverpool and Manchester Road, as *reciprocating power*.—I have thought it proper to state how far it would affect the graduation of the road to substitute planes and stationary power, and grades in other places of 30 feet per mile.

The change of plan last mentioned would only apply to burthen cars in any event, as passenger cars would be liable to less dan-

ger, interruption and delay, by using the locomotives of extra animal power to surmount the dividing ridges.

In making the survey and location, I have had lines of exploration made on various parts of the route, in two or three different directions, and more particularly near the Hudson River, where four different routes to several landings were examined, and are all represented on the maps and profiles herewith returned; and if the funds had held out to accomplish some further examinations in Rockland county, and time had permitted, I should have pursued still another line from a point on map No. 1, marked Z, and followed on the northern and eastwardly side of the Hackensack River, in the direction of the dotted line, so as to join the line which runs to the River at Tappan. Such a line opened before the final location through Rockland county.

Another part of the line ought also to be noticed further examination, which maps Nos. 3 and 4. A desire to accommodate the immediate vicinity of so important a town as Goshen, and former examinations for a Railroad having produced impressions favorable to that route, I had supposed it would prove the best ground, and therefore spent our labors upon it; and it was not until it was too late, that we observed the formation of the country from near Chester through by Florida, and the practicability of passing the Wall Kill near Pellet's Island, and joining the present line some six or seven miles west of Wall Kill, that we supposed we could change from the route near Goshen. This route requires an instrumental examination, but unless it prove greatly superior to that by Goshen, as now returned, the accommodation of so important a town ought to give it the preference. The routes between the Wall Kill and Shawangunk mountain are exhibited on the map and profiles, and a final location on this part is intimately connected with the suggestion about the Florida route.

It has been proposed to cut upon the top of the Deer-Park Gap, (which is a deep depression of the Shawangunk Mountain,) about 60 feet at the highest point. This is done in order to reduce the grade upon each side, and particularly on the west side, to 100 feet per mile. The east side can be easily reduced to a grade of 60 feet, for a short distance, and then much less.

I have looked at this point, and given it considerable thought, to determine what ought to be the present plan, in reference to future improvements, when the great increase of business on this road will demand every facility that the nature of the country will permit; and it has brought my mind to the conclusion, that before the lapse of 20 years after the completion of the road, a tunnel will be driven through the mountain, of about three-quarters of a mile in length, whereby its elevation would be so reduced, as to permit a grade of probably 75 to 80 feet, on the west side, and about 30 on the east. As the acclivity of 100 feet to the mile on the west side of the

mountain, is the steepest grade encountered on the road, it has also appeared to me to be well worthy of observation, how far this ascent could be relieved, by the adoption of an inclined plane with a stationary engine, believing, that if it is admissible on any intermediate point on the route, it might be employed at this point, for the relief of the burthen cars, to great advantage. The idea of the tunnel and the stationary engine, will, however, be matters of subsequent inquiry, at some future time, and are now referred to, only as parts of an ultimate plan, proper to be borne in mind, in the permanent location of the route.

The line as located, then follows from the foot of Shawangunk Mountain, by a high embankment across the Valley of Basher's Hill, and then crosses the Delaware and Hudson Canal without difficulty, and soon enters the Valley of the Never-sink River, which it follows to the mouth of a branch of this river, called the Sheldrake, and up that to its source: thence crossing the heads of the several branches of the Mongaup, it reaches the head of the Callicoon, (a branch of the Delaware,) which it follows to its junction with the latter river.

An examination of the ground plans will show, that a route has also been surveyed down the Popackton, or eastern branch of the Delaware; and there are also exhibited and marked several other routes through Sullivan County, which have been examined, and regular surveys carried over them, and profiles made of some.

The route passing near Monticello, which is the County town of Sullivan County, would on that account deserve a preference, if the facilities and advantages are nearly equal as to other points, such as grade and cheapness of construction; and although our surveys, as we made them, did not show as favorable a line by Monticello as by the other route, I think a further and more critical examination should be made through this district of country, to find a more favorable route than we have yet seen; and should this be the case, we should, I think, shorten the route some miles, and obtain the advantages of carrying it through a more populous and settled country.

Although the route marked on the plan as following up the Eastern, or Popackton branch, and then the Beaver Kill and Willwemach and Little Beaver, has been regularly surveyed, and profiles of it returned, I however consider the route by the Callicoon to be so far preferable, that I have not required my assistant to give me quantities on this route, and have not of course estimated it, but it can be done hereafter, if necessary or useful.

In carrying the route of the Railroad through the heart of Sullivan County, and thereby giving great and permanent advantages to a large district of country, capable of sustaining a considerable population, I will make this passing remark, that by passing down the valley of the Never-sink from the foot of the Shawangunk Mountain until I reached the valley of the Delaware River, and then passing up the Delaware to the mouth of the Callicoon, I

might have found a route of much easier grade, and which would not average over fifteen feet to the mile. But to that plan there are, in my mind, serious objections. 1st. It would be a more expensive line to grade, on account of its passing along steep side hills, and heavy ledges of rocks, requiring expensive rock excavation. 2d. It would not accommodate, or be very useful to Sullivan County, as the country along the bank of the Delaware is not generally favorable to cultivation. 3d. It might come into collision with the Delaware and Hudson Canal, and perhaps divert some of its legitimate and fair business; and in its construction it might interfere with and injure that important and very useful work, for the execution of which, its enterprising proprietors deserve to be gratefully considered.

The line then passes up the Delaware from the Callicoon to the village of Deposit, from which a lateral road may easily be extended into the heart of Delaware County. The route then crosses by a bridge the main or Mohawk branch of the Delaware, and thence follows up the Oquago Creek to its source, on the route towards Bettsburg, from whence it descends to the Susquehannah, and passing that river near Nineveh, follows up the valley of Belden Brook to its source, and then taking the head waters of Page Brook, follows that down the Chenango to Binghampton, or its vicinity.

An examination of the maps and profiles will show, that several routes have been examined between the Delaware River at Deposit and the Chenango at Binghampton, and that lines were run on the most favorable ground, on a nearly direct course between Deposit and Windsor on the Susquehannah, and between Windsor and Binghampton from the Susquehannah to the Chenango.

Both these summits, however, proved to be considerably higher than those on the route chosen; and they cannot be overcome but by stationary steam power. For a more particular description in detail, of the difficulties to be overcome, I refer to the report of Mr. Seymour, and will only add, that after having attentively examined these routes, I am decidedly of opinion, that the northern route by Bettsburg and by Nineveh and Page Brook, ought to be adopted. That route, moreover, will possess a local advantage of peculiar value, in the facilities it will give to various branch Railroads leading into the populous and wealthy sections of the State, along the valleys of the Upper Susquehannah, the Unadilla and the Onondaga branch of the Chenango, and thus accommodating the counties of Otsego, Chenango, and Cortland, and parts of the adjacent counties.

When the line came near the mouth of Page brook, on the Chenango, it became a question to determine which side of the Chenango we should pass down to near its mouth. A desire to approach near, and even pass into, the growing and important village of Binghampton, determined me to have the survey made on the east side, but ascertaining that the Chenango Canal had not then been finally located, I directed a survey on the west side also, and to pass

the river near the mouth of Page's brook. This part of the line I do not consider as settled; neither can it be finally determined until the canal is nearly completed; when that shall be done, we can see if there is a fair chance of carrying our railroad on the upper side at a reasonable expense; and should this be the case, a preference ought to be given to the east side of the Chenango, so as to approach near to Binghampton, and pass over the river near the upper part of that village.

From the Chenango river the route in following down the Susquehannah valley for about 40 miles, passes through the flourishing village of Owego, where it will become connected with the steamboat line now in preparation for navigating the Susquehannah, and also with the Owego and Ithaca Railroad, which will connect the main line with the important and fertile section of the State adjacent to the Cayuga and Seneca Lakes. After descending for 40 miles along the east branch of the Susquehannah, we approach near the Pennsylvania line, north of Tioga river, (being a large branch of the Susquehannah) and pass up its valley by Elmira, Big Flatts, and Painted Post, to the forks of the Conhocton and the Canisteo; and then following up the Canisteo to its source, we pass Hornellsville, Almond, and over the summit between the waters falling into the Susquehannah and the waters of the Genesee river.

Of nearly 130 miles on the route between the point where we leave the valley of Page brook and near Almond, the grades are all extremely easy and favorable, or can be made so.

From near Almond, in going on westward, we pass the dividing ridge where for the present we have made our grade line 72 feet per mile, but which can be somewhat relieved; and passing down Dike creek, we fall into the Valley of the Genesee river, and run down that a few miles and then up the Valley of Van Campens brook, through the villages of Friendship and Cuba, until we take the Valley of Oil creek, then down that to its junction with Ischua creek, and down the Valley of Olean creek to the Allegany river.

Through this district from the summit between the waters of the Susquehannah and Genesee and the waters of Genesee and Allegany, we have some grades which reach 50 feet per mile as the line is now run, but it is believed that considerable improvement will be made in this part on a revision of the line.

Having reached the Valley of the Allegany, we pass down it about 26 miles, over excellent ground, generally, to the Indian village, near the Cold Spring creek. There leaving the Allegany, we pass up the Valley of the Cold Spring and over a small swell of land, and descend into the Valley of the Little Conewango, a branch of the Large Conewango; and passing down that stream, and the Large Conewango, passing the village of Randolph, in Cattaraugus county, and the villages of Waterboro' and Kenedyville, in Chataugue county, following down the Valley of the Great Conewango to the Casadaga branch, and up that to its junction with Chataugue outlet,

we then follow up the Casadaga valley to Bear creek, and up that to near Bear lake: here we arrive at the dividing point between the waters which run southerly into the Alleghany and those which run northerly into Lake Erie.

At this point we are only about five miles in a direct line from Lake Erie and 740 feet above it; and here is a place where we find ground favorable to descend by one plane 506 feet in a distance of about one and a half miles; and at the foot of this plane we find ourselves nearly equi-distant from Dunkirk and Portland.

At Dunkirk the Government of the United States have expended considerable money in the construction of a harbor, and are preparing to expend more. At Portland there has been no money expended, except by individuals. The Government of the United States have had a regular survey and estimate of cost to make a harbor. I have obtained plans of each of these places, and return copies of them herewith. It is said that the cost of making a harbor upon the plan reported by Captain Maurice, of Portland, would be forty thousand dollars.

It will be seen by the maps and profiles returned, that a route was surveyed from Randolph, in the County of Cattaraugus, up the Valley of the Great Conewango to its source, and then striking off towards Dunkirk. This route was tried in order to find a more direct and shorter course to Dunkirk or to Fayette, at the mouth of Silver creek. This latter place has claims for its natural advantages for a harbor, and probably will receive attention at some future day.

In running the line to the head of the Conewango, and from thence beginning to descend the declivity toward Lake Erie, I was in hopes of finding ground favorable for descending at 50 or 60 feet per mile, and reaching Dunkirk by that grade, and thereby doing away the necessity of stationary steam power and inclined planes, but I found the whole face of the country so cut by gulfs and intersected by ridges, that I was defeated in my project, and abandoned it. The plan appears to me to deserve further exploration before a final decision.

I had also lines of survey run on each side of Chataque Lake, and thence to Portland, which are particularly mentioned in Mr. Ellet's report to me: but I have not had maps and profiles of them made.

In selecting the Casadaga route, I have considered the advantages of its passing through the centre of the County of Chataque, and approaching within about three and a half miles of Jamestown, at present the largest of all the towns in this valuable county. Its approximation also to the harbors of Portland and Dunkirk, tends to entitle it to a preference, while the strong probability that improvements will soon be made in the Alleghany river so as to render it at all times navigable for steam boats, and the fact that it may now be navigated during a considerable period in the spring, render it desirable to continue the route as far as practicable down the valley of that stream, and thereby facilitate the direct communication between the city of

New York and the great valley of the Ohio. And it ought also to be borne in mind that the construction of the road as far as this point, will go far to insure its continuation through the Western States to the Mississippi river, in which event that great western branch would leave the main line near the mouth of the Casadaga creek.

The above are the general outlines of the route, but for more minute particulars, I beg leave to refer to the Reports of my assistants Mr. Seymour and Mr. Ellet, which are herewith presented, with the details necessary.

The total amount of linear extent from the Hudson river to Lake Erie will be 483 miles, which distance may however be shortened from 10 to 15 miles by alterations in the route which may be found desirable upon a further survey. The curves upon the roads are generally easy, none of them having less than 500 feet radius.

The graduation of the road has been estimated throughout, for a double track including embankments in all cases of solid earth, and embracing all necessary bridges viaducts and culverts, together with the expenses of grubbing and fencing, comprehending in fact the whole cost of the road, except that of superintending, of the damages (if any) to be paid for the land to be taken, and the expenses of the Engineer department.

According to the report of Mr. Seymour the expense of graduation, thus estimated, for the 222 3-4 miles between the Hudson river and Binghamton will amount to \$1,551,982, being \$6,968 10-100 per mile; and according to the report and estimate of Mr. Ellet the expense of graduation thus estimated for the remaining 260 1-4 miles, will be \$1,165,536, being \$4,478 51-100 per mile. Total graduation of the 483 miles \$2,717,518, or \$5,626, 33-100 per mile, including fencing, clearing in timber land 100 feet on each side (to prevent trees falling on the road,) and also all bridges over rivers, viaducts, culverts, road crossings, &c. &c.

Cost of grading as above \$2,717,518 add 10 per cent. for contingencies.

271,751

\$2,989,269

The cutting and embankments are all 25 feet wide, and the slopes of the embankments are one and a half base to one perpendicular. This I consider as a permanent and solid form, and calculated for stability.

The expense of superstructure will vary according to the particular plan which shall be adopted.

I have caused cross sections of several different roads now completed to be drawn, and have also drawn some which I think well adapted to the country through which the road will pass, for 400 miles, if a wood and iron road is adopted—there may be seen marked No. 5. That marked No. 2, is also of wood and iron, and is the common road as now built between Schenectady and Ballston, and such as will be built between Schenectady and Utica.

Such a Road as No. 2, if built of yellow pine and oak or chesnut, will cost in Orange or Rockland about 2880 dollars per mile.

Such as No. 5, will cost about 3400 dollars per mile.

Such as the Camden and Amboy, and the Columbia and Philadelphia Road, cost 10 to 12,000 dollars per mile.

The Petersburg and Roanoke cost about 2600 dollars per mile, as I have been informed.

These are all for a single track with one turn-out or siding to each mile.

If the sum of \$3,400 per mile be taken it amounts to

1,642,900

\$4,631,469

Add for Engineering, &c. 3 per cent. on 4,359,718.

130,791

Total, \$4,762,260

This sum will grade and bridge over rivers the whole road for two tracks, and put down one track: which is all that ought to be done, until the road is travelled nearly its whole length; and this also includes the inclined plane and steam power to operate upon it, and also a long and expensive wharf into the Hudson River.

These estimates are, in my opinion, liberal, and such as will make an excellent road, and, as I have before observed, there are many places where a great reduction might be made in the expense, by a small alteration of the grade. There are also very great reductions which may be made in the out-lay of capital in the construction of this road, by making timber work in many places where I have made calculations of earth embankments.

There is no doubt that when a final location of a working line shall be made, the Engineer would be able to make small variations in the line which would very greatly reduce the expense. I make these remarks to shew that there is no doubt in my mind of the estimate being amply sufficient for grading the road.

The bridges over the large rivers, I have also estimated higher than they will cost, if only built without regard to roofing or otherwise protecting them from the weather. I have considered and planned these bridges to be only 16 to 18 feet wide, and so formed as to have a double track over them, but that so fixed as that loaded trains of cars cannot pass each other on those large bridges. I did not think so much weight, as two trains of loaded cars passing different ways, ought to be permitted to pass on a bridge at the same time. It would perhaps bring 50 tons or more on it at the same moment, which is improper, unless in one long extended train.

I have also estimated one turn-out or siding to each mile. If locomotive power is used on the long easy grades before mentioned, these turn-outs ought to be dispensed with, and only placed at every 5 to 10 miles, as they are found extremely troublesome when locomotive power is used, owing to the carelessness and inattention in leaving them open, when they ought to be shut. I find that on Railroads now in use, the test of experience has shewn it necessary to take up turn-outs which had been placed every mile, and only place them once in 10 miles, and that at the water stations for the locomotive, and in this case the man who attends the water stations sees to the turn-out being in its place whenever the cars are coming in sight.

In making the estimate, I have put down the item of fencing and also clearing away the timber on each side of the Railroad for 100 feet wide, to prevent trees from falling on the road. These items are of that kind that in many instances there may be ex-

arrangements with the owners of property to save some part of the estimated cost.

I have said that water stations, where locomotives are used, are generally about 10 miles apart. This is the case on some roads—on others these stations are 12 miles and more distant. This is regulated by the capacity of the water cars or tanks carried by the locomotive.

The country through which we pass is admirably adapted to furnish water convenient and cheap, as the springs in the sides of the hills are elevated above our grade; so that it will only be necessary to introduce some aqueduct logs, and bring the water to the proper elevation required.

In the reports of railroads which have been constructed and are now in use, the heavy items for pounded stone, which has been used for filling up trenches, have added very greatly to the expense. Experience has, however, satisfied most of the practical engineers, that the road does not stand as well when laid on broken stone, as when laid on plank or timber, and the estimates have been made on the latter plan.

It is true that almost every where along the line of this proposed road, there is small flat stone or gravel or sand, and when the plank or scantling are laid in trenches, the small flat stone may be thrown in and rammed down, and they operate as drains to cast off the water from under these timbers into the side drains: and these being properly prepared to take away all water in them, the bed of the road is kept dry and solid.

Although the appearance of the road as located is circuitous, the curves have all more than 600 feet radius. As we have run the lines, and probably in making a final line of location, it will be found that the shortest or boldest curve need not be less than 600 feet radius. These are easier curves than some on the important roads now in use in the United States, and I do not consider that any difficulties will arise in locomotive engines turning them.

The Report of the Engineer on the Eastern Division, will show two routes from the town of Liberty in the county of Sullivan to Shohocking at the junction of the Potomac, or the East Branch of the Delaware with the West Branch in Delaware County.

I have before observed that the route down the Callicoon was preferred, because it had less difficulty as to ascent—and the Beaver Kill route would have one inclined plane near Young's Gap. This route by the Beaver Kill is, however, nearly 9 miles shorter than the Callicoon route, and admitting that the tunnels (which are represented) are made instead of going round the Bend at Hawk and Sprague Mountains, then the distance will be shortened 3 miles more at least, making 12 miles shorter.

But still it appeared on a comparison, that the saving in ascent and descent, amounting to something more than 300 feet, the easier grading on the Callicoon route, and the easier curves on the line by the Callicoon and Delaware than on the Beaver Kill route, decided my mind in favor of the Callicoon route, although at increased distance.

The law under which this survey was made, provides that it shall commence at the City of New York or its vicinity, or at such point as is most eligible and convenient.

The point on the Hudson River where the road would strike, it being still subject to further revision, and knowing that no great difficulties could arise in locating the

road through the county of Westchester, the want of time and means prevented my effecting this survey. Considerations of policy would require this piece to be delayed until the other parts shall be in great forwardness, and then it will be made without doubt. All which is respectfully submitted by

BENJAMIN WRIGHT,  
Civil Engineer.

January, 1835.

[From the Baltimore Patriot]  
INTERNAL IMPROVEMENT  
CONVENTION.

The Committee of Internal Improvements appointed at the last meeting of the Convention, and instructed to report upon the present state of the public works, instituted by the people of Baltimore, and particularly to examine and report upon the propriety of recommending a town meeting to take into consideration certain proceedings of the citizens of Cumberland, in relation to a proposed Convention, beg leave to

REPORT:

That in discharge of their duty, under part of the first resolution, little else will be required than a reference to the reports which have been made from time to time, of the progress of the public works committed to the care of Incorporated Companies. These reports having been published and diffused over the community in every form, are no doubt familiar to the members of this Convention and to the citizens generally. It is therefore rather for the purpose of presenting a connected view of the subject of Internal Improvements, than of entering into any details of the actual operations upon the public works, that the committee now propose to submit a brief retrospect of the origin and progress of that system—of the causes which have impeded its advance,—of its present actual condition—and of the measures which ought to be adopted to insure its successful consummation.

In the year 1827 an immense meeting of the citizens of Baltimore was held at the Exchange, for the purpose of adopting such measures as might be found advisable to revive the city from the depressed condition to which it had fallen. The wise and experienced men who conducted that meeting, had seen for several years preceding that our city was gradually declining—that our foreign commerce was becoming more and more contracted, and our domestic prosperity keeping pace with every thing else, in the downward course. In tracing the causes which existed at home to produce this state of things,—such as the late war—its heavy national debt, and the resumption of specie payments by the banks, which reduced the currency, from greatly upwards of one hundred millions, to forty-five millions of dollars, it was hoped that when these causes had expanded themselves, the country would have passed the ordeal, and prosperity would once more spread over the land. But a little while however soon demonstrated that the causes of this national depression lay much broader and deeper, and would demand an essential change, in our national habits, pursuits, and policy. The universal peace in Europe had left the world at rest, which it could scarcely be said to have enjoyed for a period of more than thirty years. Nations which during that long period had been engaged in desolating wars and bloody revolutions, were once more thrown back upon the cultivation of the earth—the peaceful pursuit of industry and commerce, and the improvement of their social condition. The United States, which during that period might be said to have come into existence as a nation, and who had profited by her neutrality, to push her commerce into every part of the world, could not but feel the effects of the great moral and political revolutions which had just occurred; but still the conviction that an essential and radical change in our position to the rest of the world had taken place, was slowly and reluctantly adopted. Commerce was still pursued with characteristic enterprise, and

years of disaster and disappointment could not drive them from the ocean. The habits and pursuits of a people are at all times difficult of reform or change, and with us it was peculiarly the case, for ours had grown with our growth and strengthened with our strength; we knew no other, and to change or abandon them was like changing our nature. Nothing but the convictions of experience could operate upon the minds of such a people, and it required years to demonstrate that the true policy of this nation consisted in turning its capital and enterprise to the cultivation of its own resources, to improve and facilitate domestic intercourse by roads and canals, to connect the interior seas with the Atlantic—to improve the navigation of our great rivers—to open the mines of wealth, which a bountiful Providence had placed within our reach,—to supply our own wants by the encouragement of manufactures—to foster the arts and sciences—and by all those means to build up a great empire, whose commerce would equal the world and whose independence and prosperity would be permanent and enduring.

It was with such views, and under such convictions, that the people of Baltimore, in 1827, embarked in what has since been called the system of Internal Improvement, and recommended the immediate construction of a railroad to the Ohio river. The necessary legislative enactments were soon obtained from this and the adjacent states, the various routes surveyed, and after careful deliberations, a selection was made, and the work commenced.

THE GREAT OBJECT OF THIS WORK, WAS TO FORM A DIRECT CONNECTION OF THE WATERS OF THE OHIO AND THE CHESAPEAKE, by a mode of communication then entirely novel in this country, but which information from abroad in regard to such works, satisfied us were peculiarly applicable to the improvements of our own country, and which our own experience since has confirmed.

In regard to the progress of the work, the Committee refer to the annual reports which have been made by the Directors to the Stockholders; and the committee take this occasion to say, that when the vastness of the enterprise is considered; the novelty of its character, which denied the lights of experience; the appalling difficulties which presented themselves at every step of its progress; and compare them with the unshaken firmness and perseverance of the Board of Directors, it is but common justice to accord to them the highest praise for their devotion to the public service, and their zeal in the advancement of the public interest. It is seldom indeed there will be found combined more individual worth, and moral and personal influence, than is united in those to whom this great work has been entrusted.

It appears from the last annual report of the Directors for 1833, that a controversy which had existed between the railroad and the Chesapeake and Ohio Canal Company, in respect to the right of way along the valley of the Potomac, had resulted in a compromise, by which the railroad company had obtained the privilege of continuing the railroad from the Point of Rocks to Harper's Ferry, at which point the extension of the railroad is by the same compact to terminate, until the Chesapeake and Ohio Canal shall have been completed to the town of Cumberland in this state.

The annual report from the railroad company to the Stockholders states, that the road from the Point of Rocks to Harper's Ferry is nearly done, and "it is expected will be finished soon enough to enable cars to pass the entire distance from Baltimore to Harper's Ferry, eighty-two miles in all, the coming November."

The report at p. 13 proceeds as follows:

"At a time when the road approaches so near to that point, which as has hitherto been generally understood, must limit its extension for the present, and where it unites with the Winchester and Potomac Railroad, it is perhaps expected that the Board of Directors should express their opinions as to its further progress."

This seems more particularly to be called for, while the mind of this community is so feelingly alive to the efforts which have been successfully made by a rival city, to draw from its more appropriate channel the rich commerce of the

western valleys. The Baltimore and Ohio Railroad, indeed, resulted from the public opinion, which in 1826-7 declared the necessity of an effort on the part of the city of Baltimore to maintain possession of a trade heretofore enjoyed, essential to her prosperity, and threatened by the enterprising public spirit of the neighboring states. Those to whom the great enterprise of a railroad communication with the west was intrusted, were furnished by their constituents with the splendid, but vague idea only, of a bird's flight line to the Ohio river. The subject was a new one in the United States, and, indeed, almost new in England; and although the best talent within the reach of the Company was obtained, every step taken for several years after the commencement of operations was necessarily in the nature of an experiment. In looking back now with the experience that has been acquired, it is easy to see where money might have been saved, and how more work could have been done in the same time; and were the road to be commenced to-day, it is not to be doubted that it could be more economically constructed. At the time, too, that the Baltimore and Ohio Railroad was projected, the great avenue to the west, the river Potomac, was apparently open to the company, and the use of it for the construction of the road was contemplated, after the report of the first reconnaissance of the engineers was received. This avenue, however, was closed by judicial decision; and it was by agreement and purchase only that the company have been able to advance as far as to the mouth of the Shenandoah. As one of the considerations of this agreement, the railroad company was obliged to stipulate, that it would not attempt to ascend the banks of the Potomac beyond Harper's Ferry, until the canal should be finished to Cumberland, provided this were done within the time allowed by the present charter of the canal company; so that, although the route to the west, by the valley of Virginia, is still open, yet further progress up the Potomac is for the present not to be expected; and the immediate design of the promoters of the road is necessarily postponed in its accomplishment. Under these circumstances, if they will be asked, what are the views of the Board with regard to that communication with the west which the company was created to effect.

It has already been remarked, as well in this as in the 7th annual report, that there was every reason to believe that a communication with the west might be effected by means of the valley of Virginia, and that as soon as the Winchester and Potomac Railroad should be finished to Winchester, a great portion of western travel and transportation would seek the Ohio river by that route, and that perhaps, ultimately, a railroad from Winchester to Staunton, and from Staunton through Jennings Gap, would complete the entire railway communication.

In anticipating the adoption of this, however, as a practicable mode of establishing the desired connection with the western waters, the Board have never lost sight of the original route by the Potomac, and they still firmly believe, that this will, one day, and that not a very remote one, be accomplished.

In the opinion of the Board of Directors, the immediate interest of the stockholders, as well as of the city of Baltimore, and the State, of which Baltimore is the heart and the emporium, now lies in the completion of the Chesapeake and Ohio Canal to Cumberland; both in reference to the agreement of compromise already alluded to, and as forming an important link in the chain of communication, and furnishing a means of conveyance from the coal mines to tide, or to the junction with the railroad at Harper's Ferry. For the present, therefore, the Board would not think, even if they had it in their power, of making the railroad parallel with the canal; but, taking up the route where the canal terminates, at Cumberland, would push it across the mountains, upon the trace originally intended for it, and to the point of its original destination. The Chesapeake and Ohio Canal and the Baltimore and Ohio Railroad ceasing to be, as they were for many years, hostile opponents, would then be united in interest, in every particular, and would jointly afford the desired communication. If, at any future day, the state of the trade should require it, and the income of the road should justify it, freed

from the condition that now fixes Harper's Ferry as the western limit on the Potomac, the road might be brought down the River, and the continuous railroad communication, as first designed, be finally accomplished.

In the prosecution of the design thus marked out, the parties most deeply interested are the State of Maryland and the City of Baltimore; and it is to the public spirit and liberality of these, that the Board confidently look for the means to prosecute it successfully.

From the view which is here presented, the construction of a railroad communication with the west is postponed to a period necessarily indefinite; tho' the Directors indulge the hope that at some future day it will be resumed and accomplished upon the plan originally projected. For the present, however, it is true policy and common sense to consider the projected railroad to the west as terminated at Harper's Ferry, and that the company have neither the moral nor physical power to go beyond that point, by reason of judicial decisions, and their own compact with the Chesapeake and Ohio Canal Company.

In this state of things it becomes an energetic people, instead of indulging in vain regrets over their disappointment, to look forward and promptly adopt such measures as the existing state of things call for.

The Directors of the Railroad Company have freely expressed their opinion, that the immediate interest of the city of Baltimore and the State now lies in the completion of the Chesapeake and Ohio Canal to Cumberland. This proposition, after all that has passed, and coming from the source it does, is calculated to excite surprise, when thus broadly presented. But this ought not to deter us from giving it proper consideration, and weighing it with candor and liberality.

The question would be perhaps more simple if it were presented not as an alternative proposition to be accepted or rejected, but rather as a matter about which there is no choice. The people of Baltimore have expended about three millions of dollars, in the effort to make a railroad communication with the west, and having arrived at Harper's Ferry, are impeded in their progress by another company, who are decided to possess the exclusive right of way from that point. To aid this company, therefore, in the extension of their work, seems no less the dictate of policy than of necessity, as otherwise the vast amount of money expended in the construction of the railroad to that point would be comparatively of little value. The completion of the canal to Cumberland, independently of the benefit to the railroad, would bring a vast trade within reach of Baltimore enterprise, besides affording great facilities and convenience to that which we already enjoy from the south and western country. Indeed, it might be considered that the importance of a communication with the coal region of Alleghany is of itself sufficient to justify the construction of the canal, and to call for such aid as it may be in our power to afford.

The Committee having thus briefly expressed their opinions on this part of the subject, would recall their own and the attention of the Convention to the great and important object of a communication with the western waters. At a very early period in the history of Internal Improvement, this was the ultimate object to which the efforts of all the States and companies was directed. New York, Pennsylvania, Maryland, and the District of Columbia, all engaged in the enterprise—opinions were divided not only as to the best route, but also the best mode which should be adopted. Some advocated the valley of the Potomac, whilst others preferred the valley of the Susquehanna. The zealous advocates of railroads would not listen to any thing else, whilst the steady supporters of canals as tenaciously adhered to their system. In the mean time the various works which had been projected were pushed forward with all the efforts which power and interest could exert, stimulated to an increased action by the zeal of rivalry, and the anticipation of triumph. The State of Pennsylvania has completed a canal communication from Columbia to Pittsburg; and by means of a railroad, the communication is now opened on the whole line from Philadelphia to Pittsburg. New York,

also, by means of her canal and the Ohio canal, now enjoys the benefit of a direct communication with the western waters, and these two great cities are now engaged in a successful competition for the trade of the western country. The works which have been projected in Baltimore and the District to engage in the contest for this trade have, after a period of nearly seven years, reached about one-fourth of the distance to the western waters. The railroad has terminated at Harper's Ferry, a distance of eighty-two miles from Baltimore, whilst the canal has advanced altogether a distance of 104 miles from tide. The total expenditure on these works is about eight millions of dollars.

The Committee look to the extension of the canal to the eastern base of the Alleghany as a work of great importance, and entitled to receive the support of the people of Baltimore, the State of Maryland, and the western States. We must turn in another direction to find a mode of communication with the west—easier, more expeditious, and at less cost.

If we have to wait for the completion of these great works to enter into a competition for the trade of the west, we should find it firmly fixed at New York and Philadelphia, and our efforts to withdraw it would be in vain. Competition would be too late to rescue from these powerful cities a trade which they had enjoyed for years. If we expect to participate in it we must be early in the field; the delay which has already occurred will render the competition more equal on the part of our eastern neighbors. It is true the natural advantages of our position are great, but it must be borne in mind that this very system of roads and canals has the direct effect of reducing the importance of distances, and will bring all the Atlantic cities upon a much closer equality in reference to the trade and intercourse with the western country—and the vast capital of these great cities, combined with the increased facility and diminished expense of transportation, gives them advantages that will call for all our energies to preserve a trade which has been the source of our rapid advance, and which is now more than ever essential to our permanent welfare and prosperity.

The Committee believe that this important object may be effected, by forming a junction with the Pennsylvania works.

The state of Pennsylvania, as before remarked, has already opened a canal along the valley of the Susquehanna, (and crossing the summit of the Alleghany by a railroad,) thence to Pittsburg; to form a connection with this route has long been a favorite object with some of the citizens of Baltimore, who anticipated the improvements which have been effected in Pennsylvania; and during the same session of the Legislature of Maryland, which incorporated the Ohio Railroad and Canal Companies, a charter was granted to the Susquehanna Railroad Company to extend a railroad to the nearest and most practicable point upon that river. The stock of this company was promptly subscribed for, and its operations were commenced in the full confidence that the liberal policy of the state of Maryland in regard to the extension of improvements through her territory, would be followed by Pennsylvania, and a charter granted to the Maryland company. In this reasonable expectation the advocates of that work were disappointed, and it was not until the last session of the Legislature of that state, that a law was passed which opened the way for the proposed improvement; by that act a railroad is authorized to be constructed from the Maryland line to the borough of York, from which point there is a canal now in operation which communicates with the river Susquehanna,—from the present termination of the Baltimore and Susquehanna Railroad to the town of York, the distance by any of the routes selected for its extension will not exceed sixty miles, and will probably fall short of that number. The cost of the work as estimated by able engineers, will be less than a million of dollars, and it could be completed within eighteen months from the time of its commencement.

The completion of this work would effect the double object of securing the Susquehanna trade to this city, and of effecting a direct communication with the western waters by means of the

Pennsylvania Canal, in the shortest possible time, and at the least expense to ourselves.

The trade of the valley of the Susquehanna, which includes a thousand miles of natural navigation, (the greater part of which is now improved by canals, and which comprises one of the finest countries in the world,) is of vast importance to this city; it has been a fruitful source of profit to our enterprising traders, and has heretofore amounted annually to millions of dollars. But it has diminished—is diminishing, and will be entirely lost, unless some effort be made to secure it. In this point of view alone, it would seem that the extension of the Susquehanna Railroad would be an object worthy of the especial consideration of this convention, but when taken in connection with the fact that it opens the most direct and immediate communication with the western waters, it may fairly present itself for patronage and protection. The committee will avail themselves of another occasion to present to the convention, a view of the trade of the valleys of the Susquehanna and its vast importance to this city. Its magnitude is not sufficiently understood or appreciated by the citizens of Baltimore, and its value is only beginning to be felt as it is about to be lost.

The committee have thus shown in the plainest way in which they could find language to express themselves, the present state and condition of our plans of internal improvements, and the causes which have impeded their progress up to this time.

The conclusion to which the committee have arrived, after the best consideration they have been able to give the matter, is,

First, that it will be the true interest and policy of the people of Baltimore to encourage and promote the completion of the Chesapeake and Ohio canal to Cumberland; and

Secondly, that it is the true interest and policy of the people of Baltimore to encourage and promote the completion of the Baltimore and Susquehanna railroad, to the town of York, and the river Susquehanna.

The next and most important matter is to suggest the means by which these great works are to be accomplished.

On this point, the committee have no hesitation in coming directly up to the question, and giving their decided opinion, that *it can be accomplished in no other way than by means of the authority of the state, and the pledge of its credit, with such aid as may be obtained from the government of the United States.*

If the position assumed by the committee in the previous part of this report, that the system of internal improvement is the natural and necessary policy of the nation, growing out of its actual condition, be a correct one, it follows that the government is bound to support and maintain it by all the means in its power. There is no State in the Union to which this remark will apply with greater force and truth than to Maryland; fixed in the centre of the Union, with the finest bay in the world leading to her emporium, she has every facility of commerce and intercourse—looking into the interior from Baltimore, she occupies the nearest position upon the Atlantic to the northern and western countries. The great river Susquehanna on the north, and Potomac on the south, open natural channels of communication with the lakes and the western waters, and all the artificial improvements of roads and canals over this immense extent of country do but come in aid of what nature has done for us. Such is the advantage of our natural position, that we have but to stretch out our arms to the Potomac and the Susquehanna, and avail of the trade which others are seeking to draw off from its natural outlet.

The State of Maryland, it is true, has advanced a liberal hand to the support and encouragement of individual enterprise, and in the incipency of the system, it was perhaps as much as might have been expected. But, in the present state of things, a bolder and more decided course must be adopted by the State, or the public works will fail altogether. Individual means and credit are exhausted, and it would be a vain deception to attempt to conceal it. In making an appeal to the State for aid, no people can do it with more confidence than the people of Maryland. It may be fairly estimated that eight millions of dollars have been expended in the various works of internal improve-

ment; of this sum the State holds \$500,000 in the Ohio Railroad; \$500,000 in the Ohio Canal Company; \$100,000 in the Susquehanna; \$500,000 in the Washington Railroad; which, with some other contributions to public works, may make the State's subscription to public works amount altogether to two millions of dollars. How different has been the policy of New-York, Pennsylvania and Ohio? There the States upon their own credit have undertaken all their public works—and what has been the consequence? New-York has an intercourse with the lakes and the western country—Pennsylvania has converted every stream in her vast territory into a fender for a canal, and is the first to pass the Alleghany mountains—Ohio has constructed a canal through the State to a port upon Lake Erie, whence she finds an easy way to New-York. Other States have pursued the same policy, and their people are deriving the benefit from it. It is time the State of Maryland should take the lead of her people in this great effort to sustain their vital and important interests, and her own standing in this great confederacy.

The committee cannot permit this occasion to pass without exhorting the Convention to a steady perseverance in the objects which have brought them together. They cannot fail of success; there is too much spirit and enterprise, too much wealth, and too much pride, in the people of Baltimore, to permit it to sink below its natural position. It needs only that we should give a concentrated expression to public opinion to produce a combination of action, and effect all that we desire. The public works must and will be completed, and no power upon earth can prevent it. Let us act under these impressions, and with this conviction, and Baltimore will soon resume her position amongst the Atlantic cities.

The Committee, in obedience to the requisition of the Convention, have had under consideration the proceedings of the citizens of Cumberland, in relation to a proposed Convention, to be held in this city, on the eighth of December next,—and beg leave to submit the following remarks:

The Committee on Internal Improvement, to whom was referred the Resolution requiring them “to enquire into the expediency of recommending to the citizens of Baltimore to assemble in Town Meeting, for the purpose of considering the proceedings of a meeting in Alleghany County, in relation to the Chesapeake and Ohio Canal,” beg leave respectfully to report—that while the field of labor entrusted to their particular care is extensive, and necessarily requires arduous and close investigation, they feel that their labor is very much lightened, and the extension of their investigation much contracted, in consequence of the specific nature of the resolution under which they are called to act. The inquiries which naturally present themselves to the minds of your Committee, in relation to the subject of this resolution, are first, the nature and object of the Chesapeake and Ohio Canal; and second, the relations which the City of Baltimore bears to it.

The Convention is no doubt aware that one of the most serious subjects which ever engaged the attention of the Father of his Country, was the completion of an easy, safe, and speedy communication between the Eastern and Western portions of our land; justly believing that if such an object could be accomplished, it would tend greatly to prevent that alienation of affection among our citizens, which might grow from the circumstance of their being widely separated by the great natural barriers which would exist between them—and at the same time, by an interchange of commercial intercourse, create those sympathies which would naturally bind them to each other by a common interest; with these views his attention was directed to the Valley of the Potomac, as being a route which seemed to present greater facilities for the accomplishment of so desirable an object than any other. The first efforts made for this purpose were to incorporate a Company, who endeavored to improve the bed of the river so as to render it navigable as far as possible above tide water, without incurring the expense and labor of excavating a Canal—and large sums of money were expended, but without producing any important effect. In the year 1824, a Company was incorporated for the purpose of building a Canal along

the banks of the river, from Washington City to the Ohio River, having all the rights and privileges appertaining to the former Company—and in the year 1828, the first earth was removed, in the commencement of this important undertaking. Since that period, it has been gradually progressing, aided by the patronage of the Government of the United States and State of Maryland, and its present terminus is found 8 miles above the town of Williamsport, and 108 miles from Washington City. The work itself, so far as it has been completed, is of the most magnificent character, and well calculated for the important purposes which it is designed to subserve. It is 50 feet wide and 6 feet deep, being considerably larger than any similar work in this country—and when completed, will be capable of receiving and bearing upon its bosom the incalculable wealth of the interior, with more facility and to a greater extent than any similar work in the country. It will be one of those arteries which by the action and re-action of commercial facilities, rendered to the East and to the West, will tend to bind our citizens more closely together, and to diffuse the blessings of prosperity and peace to the most distant portions of our land. But it would appear to be useless to detain this Convention and to occupy its time in enlarging upon the object of this work. So national is its character, and so palpable its object, that “he who runs may read, and the wayfaring man, though a fool, need not err therein.”

Your Committee now approach a more important consideration, viz.: the relation which the City of Baltimore sustains to this important work; and in doing so, it is natural to inquire what are the facilities which she enjoys in comparison with her eastern neighbors, the cities of Philadelphia and New-York, as regards a communication with the West. As respects local situations we see she has decidedly the advantage. The distance from Baltimore to Pittsburgh, on the Ohio River, is about 240 miles; while from Philadelphia it is 300, and from New-York, perhaps, not less than 500 miles. But the advantageous position of Baltimore, in a commercial point of view, will be more readily seen, when we consider the relative price of transportation, by wagons, between it and Pittsburgh, and Philadelphia and Pittsburgh. For many years the difference in favor of Baltimore was from fifty cents to one dollar per hundred pounds—and while she was enabled to present a market for the purchase and sale of such goods as would not bear any accumulation of charge for transportation, such as groceries, domestic goods, hardware, &c. she even caused her eastern neighbors to become tributary to her prospects and to acknowledge her superior position, in regard to the great West, by becoming the place of transit for the goods purchased there. Under these happy circumstances she was rapidly growing into importance, until the successful application of steam in the navigation of the Western waters gave the first severe blow to her prosperity, and transferred to the city of New-Orleans much of that trade, which, until then, belonged to her. But this event only affected her in common with the cities on the eastern seaboard, and left her with all her natural advantages still unimpaired—and had nothing occurred to counteract these advantages, she might, notwithstanding, have gone on a career of substantial and unflinching prosperity. But unfortunately for her prospects, this change has occurred, and unless she can find a remedy, she must see the fountains of her prosperity, one by one, dried up, and eventually become an object of loneliness and desolation to the passing traveller, as he contemplates the remains of her former glory. The State of New-York, under the auspices and energies of one of the most gigantic minds of which our country could ever boast, conceived and executed the magnificent plan of uniting the waters of her own Hudson with those of the far distant Western Lakes, and as a result, her emporium is now deriving the rich returns of so noble and enlightened an enterprise. In consequence of these spirited and successful efforts, the young, though vigorous State of Ohio, finding her interests so deeply involved, undertook to accomplish a similar work from Lake Erie to her Southern Boundary, on the Ohio River, thus affording a continuous Canal, Lake, and River navigation, from the

Ohio River to the City of New-York, a distance of more than 1000 miles, and as a consequence of these stupendous efforts, your Committee would state the singular fact that goods may be delivered at Portsmouth, at the Southern terminus of the Ohio Canal, from the City of New-York, more than 1000 miles, at a less rate of transportation than would be required from Baltimore to Wheeling, a distance of only 290 miles, even at the lowest prices at which our carriers can live and sustain their wagons and teams.

The great State of Pennsylvania, finding herself likely to be outstripped by her northern neighbor, in the race for the golden prize, devised and executed a system of Canal and Railroad transportation from Philadelphia to Pittsburgh. By this means, goods may now be transported from the former city to the latter in the short time of about 10 days, at the rate of \$1 to \$1.25 per hundred pounds; so that her commercial emporium has not only regained all she lost in consequence of the early completion of the New-York and Ohio Canals, but is continually experiencing an accession of trade, derived from one of these very sources. From this view of the case, it will be seen that our natural advantages, without being improved by some artificial means, are no longer of much avail to us in the transportation of goods westwardly. But your Committee would also shew that, as a commercial city, Baltimore is likely to be affected quite as seriously in the other direction. The superior natural advantages of Baltimore were at one time quite as valuable to her in the reception of produce from the West as in the transportation of merchandise towards that quarter. Wagons could always afford to haul much cheaper to her than to Philadelphia, and as a natural consequence, immense quantities of Bacon, Tobacco, Glass, Wool, &c., the products of the West, sought their natural market here, but such, unfortunately for her, is not the fact under existing circumstances; all those articles and many others now find a cheaper mode of transportation to Philadelphia, by the Pennsylvania Canals, and although the Tobacco crop of Ohio is still brought to this market, via the Pennsylvania Canals, in consequence of the facilities rendered by our inspection laws, and from the fact of its being a large market for that article, as the product of this State, yet it cannot be supposed that such can long continue to be the case, but that Philadelphia will soon afford all the facilities which may be necessary both to command and retain the trade.

Your Committee have been thus minute, perhaps prolix, in their detail of the present commercial prospects of our beloved City, in order that they might impress them more forcibly upon the mind of each member of this Convention, and induce him to look more anxiously about for some mode of relief from the ruin which evidently stares us in the face; and without pretending at all to express an opinion as to the comparative importance of the Chesapeake and Ohio Canal, with other projected works of improvement, your Committee would respectfully call the attention of this Convention to the following views in relation to the relief which will be afforded by this work, provided it is completed even as far as Cumberland, and especially if it be completed to its intended termination, viz.: the Ohio River. The distance from the City of Baltimore to the Point of Rocks, by the Baltimore and Ohio Railroad, is about 70 miles, at which point the Baltimore and Ohio Railroad Company will deliver goods at the rate of 20 cents per hundred pounds—thence per Chesapeake and Ohio Canal to Cumberland, 140 miles, upon which distance goods may be transported at the rate of 2 cents per ton per mile, or for 14 cents per hundred pounds for the whole distance—thence to Pittsburgh by wagon, the price of transportation, say 105 miles, cannot exceed 50 cents per hundred pounds, making the cost of transportation the whole distance, 84 cts. and allowing 16 cents more for the cost of freights and agencies in transshipment, it will be seen that the cost will not exceed one dollar per hundred pounds from Baltimore to Pittsburgh. Your Committee believe, moreover, that the rate of transportation, especially upon the Canal, are high—the price charged for toll upon the Pennsylvania Canal, is believed to be only 11 mills per mile, which is but little more than one half the present

rate charged upon the Chesapeake and Ohio Canal; and they have no doubt that when the immense transportation to be done between the East and the West shall have taken this channel, the price will be materially lessened, so that, eventually, goods may be delivered on the Ohio River at perhaps little more than half the foregoing estimate.

The assurance recently given in the late annual report of the Baltimore and Ohio Railroad Company, that the Railroad will eventually take this route, and the prospect that with the completion of the Canal to Cumberland, the Railroad will be also completed across the mountains, is not the least encouraging item in connection with this subject, which your Committee would present for the consideration of this Convention.

The distance from Philadelphia to Pittsburgh, by way of the Union and Pennsylvania Canals, is 440 miles, and by way of the Columbia Railroad and Pennsylvania Canal, 490 miles. The distance from Baltimore to Pittsburgh, via Baltimore and Ohio Railroad and Chesapeake and Ohio Canal to Cumberland, and thence to Pittsburgh, is about 300 to 320 miles, so that our naturally advantageous position will always give us the preference on account of the great cheapness of transportation. Your Committee do not draw the comparison between the Pennsylvania Canal and the Chesapeake and Ohio Canal, &c. from invidious motives; but simply with the view to show our relatively greater natural advantages, and that with those advantages, properly improved, there is no room for despair. No, the great West will give employment to all the channels of communication now opened or in contemplation, and perhaps as many more, and our feelings should rather be those of a family partaking at the same bountiful table, than of rivals, each striving to obtain whatever is within its reach, and greedily grasping at what is not, in order to appropriate it selfishly to himself.

Your Committee have not adverted to the immense advantages to be derived from the transportation of coal, lumber, stone, &c. to be found abundantly distributed along the banks of the Canal, and for which object alone it would be worth all its cost—but have confined their observation to the bearing it has upon the great commercial interests of our city with the West, believing that these fell more especially within the line of the duty devolved upon them, and under the deep and abiding convictions of the truth of the facts and observations recited in the foregoing reports, they submit the following resolutions:

*Resolved*, That it is the true interest and policy of the people of Baltimore and the State, to promote the completion of the Chesapeake and Ohio Canal to the town of Cumberland, in this State.

*Resolved*, That it is the true interest and policy of the people of Baltimore and the State, to extend the Susquehanna Railroad to the Borough of York and the river Susquehanna.

*Resolved*, That this Convention earnestly recommend to the citizens of Baltimore to assemble in town meeting, for the purpose of considering the proceedings of a meeting held in Cumberland, Allegany County, in relation to the extension of the Chesapeake and Ohio Canal, and that the Mayor be and he is hereby requested to call said meeting.

Which were adopted.

*Report of the Probable Revenue of the Chesapeake and Ohio Canal, made to the Baltimore Convention, December, 1834.*

MR. STEWART, from the Committee appointed to report as to the probable amount of tolls receivable on the Chesapeake and Ohio Canal, after it reaches the Coal Mines near Cumberland, and after its completion to Pittsburgh, made the following Report:

That the Committee have given the subject an attentive consideration, and the result is a firm conviction that the Chesapeake and Ohio Canal will afford a more profitable investment of funds than any other similar work of Internal Improvement in the United States; possessing, as it does, advantages in reference to climate, distance,

structure, and sources of revenue, decidedly superior to any other constructed or contemplated. To satisfy the public of the correctness of this position, the Committee will not deal in (what is too common on such occasions) assumed facts and speculative reasoning, but they will content themselves with a brief and plain statement of well known and ascertained facts, about which there can be no controversy, and which they respectfully submit, without comment, leaving an enlightened public to supply the argument and the conclusions.

The object of the Chesapeake and Ohio Canal is to connect the tide water of the Atlantic with the Ohio and Mississippi, and ultimately with the Lakes, and as its revenue must, in some measure, depend upon its ability to maintain a successful competition with other similar works, the Committee will submit, in the first place, a comparative view of the three great lines of communication between the Atlantic and the West,—the New-York, Pennsylvania, and the Chesapeake and Ohio Canals. The Committee are, however, far from indulging the erroneous idea that these works can be properly regarded as rivals, that the one can possibly supersede the other, or that their interests can come materially into conflict; on the contrary, a moment's reflection upon the immense increase of the population and commerce of the West must satisfy every one that the time is not distant when not only these, but additional communications, will be indispensable to give vent to this vast and increasing intercourse.

COMPARATIVE VIEW,

As to distance, time, lockage, dimensions, climate, and cost of transportation, on the New-York, Pennsylvania, and Chesapeake and Ohio Canals, in connection with the Ohio River and the Lakes.

The distance from New-York to the Ohio river, by the New-York and Ohio Canals, is 1,008 miles—670 thereof canal, 145 river, and 193 lake navigation; on this line there is 1,877 feet of lockage—699 on the New-York, and 1,185 on the Ohio Canal; and three transshipments, one at Albany, another at Buffalo, and a third at Cleveland.

From Philadelphia to Pittsburgh, by the Columbia railroad and Pennsylvania canals, is 394 miles—276 by canals and 118 by railroads; the ascent and descent on this route is 5,920 feet; and, by the Schuylkill, Union, and Pennsylvania Canals, the distance is 441 miles, ascent and descent 4,514 feet, 1,944 by locks, and 2,570 by inclined planes; and, as the latter route is found to be the cheapest for transportation, it is adopted for the purpose of this comparison. On this line there are two transshipments, one at Holidaysburg, and the other at Johnstown.

From tide water at Washington City to Pittsburgh, by the Chesapeake and Ohio Canal, is 341 miles continuous canal, lockage 3,215 feet; and when the canal shall have reached Cumberland, the distance from tide, to the navigable waters of the West, will be only 258 miles, viz.: 186 miles by the Chesapeake and Ohio Canal, and 72 from thence, by the Cumberland road, to Brownsville, on the Monongahela, where steamboats now arrive and depart for New-Orleans daily, for several months in the year, and on which the cost of transportation would be \$13 58 per ton, viz.:

By canal 186 miles, at 3 cents per ton, \$5 58  
By Cumberland road to Brownsville, 72 m., 7 00  
By steamboats to Pittsburgh, 1 00

\$13 58

The dimensions of the New-York and Ohio and Pennsylvania Canals, are the same, viz.: 40 feet at water line, 28 at bottom, and 4 feet deep. The Chesapeake and Ohio Canal is 60 feet at water line, 42 at bottom, and 6 feet deep, being 50 per cent. larger than the New-York, Ohio, and Pennsylvania Canals; the cross section of the one is 306 square feet, and the other only 136, and the moving power differs in the ratio of 100 to 171. It is ascertained on the New-York, Ohio, and Pennsylvania Canals, that freight boats travel from 2 1/2 to 3 miles per hour, and having relays of horses, usually travel night and day, making from 60 to 70 miles in 24 hours. For the purposes of this comparison we

will assume 45 miles as the average in 24 hours; the cost of transportation we estimate at 8 cents per ton per mile, (two for tolls and one for freight;) each transshipment is supposed equal to one day's delay, and to cost 12 cents per ton.

The trade of the lakes at Cleveland will have to travel 701 miles to New-York, 623 miles to Philadelphia, and 523 miles to Washington City, by way of Pittsburgh.

Applying the above facts and principles, the result is as follows:

Canal or route	Distance to Ohio river	At 45 miles per day	At 3 cts. per ton per mile	Cost per ton.
N. Y. Canal, 1,008		224	13	\$30 24
Pennsylv'a do. 441		10	13	13 23
Chas. & O. do. 341		71	10	10 22

And it will be observed that the above is the comparative result as to distance, time, and cost, without claiming any thing for the Chesapeake and Ohio Canal, on account of its enlarged dimensions or for its continued navigation for one or two months in the year, after the New-York Canal is closed by ice; nor have the Committee added any thing to the delay or expense of transportation on the New-York and Pennsylvania Canals on account of three transshipments on the one and two on the other, which will certainly more than counterbalance any supposed advantage that can possibly be claimed in any other respect.

As doubts have been expressed as to the practicability of a continuous water communication by the Chesapeake and Ohio Canal, the Committee beg leave to remark, that repeated examinations and measurements, made during the driest seasons of the year by the United States Engineers, as well as those of the Company, have uniformly resulted in demonstrating that the supply of water at the summit level is abundant. Mr. Sullivan, one of the Board of Internal Improvement, affirms, in his report, that the "supply of water capable of being brought to the summit level, is more than treble that required," and that the Canal is competent to the passage of tonnage sufficient to realize tolls, at the usual rates, equal to 5,500,000 dollars per annum, or 30 per cent. upon its estimated cost; and more recent surveys have also demonstrated that the principal coal vein at Savage, and other points where opened, is within 48 feet of the elevation fixed for the tunnel; and from the indications of coal on both sides of the ridge, near the commencement and at the termination of the tunnel, the opinion is entertained that it may pass through a continuous coal vein of fifteen or twenty feet in thickness; if so, the coal would more than compensate for the whole expense of its excavation.

In England there are many tunnels nearly as extensive as that here proposed, and some exceeding it, viz.: The Bridgewater Canal has a tunnel of 4 miles in extent; Huddersfield 3; Derby 2; Ellismere 2; Grand Junction 2; Hereford and Gloucester 2; Kent and Avon 2, &c.

Having thus established, by a statement of facts which it is believed, cannot be controverted, the decided superiority of the Chesapeake and Ohio Canal, in reference to climate, distance, structure, and cost of transportation, it remains for the Committee to submit some facts calculated to show the probable amount of revenue or tolls receivable after the Canal reaches the coal mines, and after it is completed to Pittsburgh; and, in this respect, they think the superiority of the Chesapeake and Ohio Canal will still be more conspicuous.

The sources of revenue relied on are,

motive source of found, in Europe

Canal, and afford-  
ing of revenue on

id at the cheapest  
work  
nd marble, found  
r quality, on the

ic fisheries, equal

ng abundant for  
power.

7th. Agricultural produce from the western and other states, and parts of Virginia, Pennsylvania, and Maryland.

8th. Merchandise, &c. for the western States.

And first, of coal. The Committee lay down this position with perfect confidence, that bituminous coal, of superior quality, can be delivered on tide water for a less sum, by this canal, than it can be delivered at any other port on tide water in the United States. If this be true, it follows as a matter of course, that there will be no limit to the demand for exportation but the capacity of the canal to deliver it.

Let the truth of this be tested by adopting the prices paid for mining, tolls, and transportation, on canals now in operation in Pennsylvania and New-York.

The Chesapeake and Ohio canal will penetrate and pass through coal banks from ten to twenty feet in thickness on the margin of the Potomac above Cumberland, from which the coal can be thrown into the coal boats with a shovel; and to show the inexhaustible supply at the Savage coal mines, the Committee refer to the following extract from the report of one of the Chief Engineers, N. S. Roberts, Esq. in 1833, to the Board of Directors, in which he says, "The coal district thus accommodated, would be not less than five miles wide, covering a surface of more than 900 square miles. Over at least one fifth of this it is believed the thick vein of coal extends, which measures, where it is now opened, at least 13 feet thick. But the coal mines that could be opened, within five miles of Westernport and Savage, would yield coal to an immense amount. As each square mile of the great vein alone would yield more than two hundred millions bushels of coal, or 60,000,000 tons, and if it could be exported at the rate of five hundred tons per day, it would require four hundred years to exhaust one square mile of the great coal vein! Iron ore of excellent quality is said to abound in this coal district; and with the facilities of a canal transportation, together with the cheapness of bituminous coal, charcoal, and subsistence, in a very healthy country, would be an inducement to the enterprising of our citizens to extend the manufacture of iron to a great amount, and thereby improve and give great value to the water power that might easily be created on Savage river and the Potomac, for all the manufacturing and mechanical purposes of a very extensive population."

It is a well known fact, that on the Monongahela river, coal excavated from similar mines is now delivered at thirteen steam mills and factories, at one cent per bushel. It is presumed it will not cost more, under similar circumstances, to deliver it in a coal boat on the Potomac; but let this sum be doubled, and say that coal in boats will cost 2 cts. per bbl.

Tolls.—The tolls charged on the Pennsylvania canal for transportation of coal, is half a cent a ton per mile, which at 30 bushels per ton will be nearly 4 do. do.

Freight.—A boat carrying 1,600 bushels, travelling 2 miles per hour, or 48 miles in 24 hours, (less than the usual speed,) will reach tide in 4 1-2 days; it will require, say 2 men, \$2, a boy and horse 75 cents each, making \$3.50 per day, or \$15.75 for the trip, equal to nearly 1 do. do.

It is presumed that the returning freight from Washington and the Baltimore railroad will at least pay expenses; but suppose there be no return loading, charge as above 1 do. do.

Profits.—Add for profits \$22 per load, more than 25 per cent. on the whole capital employed 2 do. do.

Total at tide 10 cts per bbl.

But suppose the canal to terminate at Cumberland, and the coal to be carried 7 1-2 miles on a railroad, and to cost in the boats 4 1-2 cents instead of 2, as above, difference 2 1-2

12 1-2 cts. per b.

The Committee have thus adopted the most liberal allowances, more than they believe will be the actual cost; and they feel confident that the strictest scrutiny into all the elements of the calculation cannot increase the price they have adopted.

If then the bituminous coal from Cumberland can be delivered at tide, for this sum, of course it can be transported coastwise to all our Atlantic ports and towns cheaper than it can be obtained from any other part of the world; and if so, can there be any assignable limit to the demand?

Let us see whether this position is sustained by facts. The cost of transporting coal from Philadelphia to Washington, (as a regular business and not as ballast,) is \$1 50 per ton, or 5 cents per bushel; to Baltimore, coastwise or by railroad, from Point of Rocks, 4 cents per bushel; to Boston \$2 per ton, or 7 cents per bushel, and it may be carried to Charleston, or the most distant of our seaports for 8 cents per bushel, which is more than is received by importers from Liverpool, viz.: cost at Liverpool 12 1-2, duty 6 cts.; deduct, also, insurance, commissions, wharfage, &c., and it leaves less than 8 cents for freight. Apply these facts, and the cost of Cumberland coal will be in our principal cities as follows, viz.:

In Washington, Alexandria, and Georgetown, (per bushel) 12 1-2 cts  
Present price 67 per ton, or 25

Saving, 12 1-2

In Baltimore it will be 16 cts.,  
viz.: at Washington, 12 1-2  
Freight, 4

16 1-2  
Present price, 25

Saving, 8 1-2

In Philadelphia it will cost 17 1-2  
cts., viz.: at Washington, 12 1-2  
Freight now paid, 5

17 1-2

The price of bituminous coal is now  
\$7 per ton, or 25

Saving, 7 1-2

[At Philadelphia, Anthracite is \$5 per ton, or 17 1-2 cents per bushel; so that the Cumberland will not affect the Anthracite, but merely supply the bituminous coal, required for many uses to which the Anthracite is inapplicable, viz.: gas, coke, smith's shops, steam purposes, &c.]

In Boston it would cost 19 1-2 cts., viz.:  
In Washington City, 19 1-2  
Freight, 7

Present price in Boston \$9 per ton,  
or (per bushel) 35

Saving, 12 1-2

Thus it appears, from well authenticated facts, collected with great pains, that Cumberland coal can be delivered, coastwise, at all our Atlantic cities and towns, cheaper than it can be obtained from any other part of the United States, or Europe; and of course the capacity of the canal to furnish it will be the only limit to the supply required.

What, then, will be the capacity of the canal, and the amount of tolls? It is stated by Sir John Sinclair, in his statistics of Scotland, that there was transported in 1824, to the city of Glasgow, (with a population of 147,043,) on the Monkland Canal alone, 1,690,453 tons of coal, equal to 47,338,284 bushels, which, at the rate of half a cent a ton a mile from Cumberland to Washington City, would amount to \$1,690,453, equal to 30 per cent. upon \$5,000,000, the whole estimated cost of the canal to the coal mines at Cumberland. The dimensions of the Chesapeake and Ohio Canal are greatly superior to those of the Monkland Canal. The tonnage on the Schuylkill Canal, engaged principally in the transportation of coal, was equivalent to 12,483,673 bushels; and the coal actually consumed in Philadelphia, in 1833, (independent of the amount

exported from thence, amounted to 11,565,000 bushels. This amount alone, if transported on the Chesapeake and Ohio canal, would have yielded at a 1.2 cent a ton per mile, \$462,600, nearly 8 per cent. on its entire cost. And it is ascertained that the city of Pittsburgh, with a population, at the last census, of 12,568 souls; consumed, in 1833, 7,665,000 bushels of coal, much of it in her numerous manufacturing establishments. The population to be immediately supplied with Cumberland coal, is as follows:

The District of Columbia,	40,000
The city of Baltimore,	80,630
The counties and towns in Virginia and Maryland, bordering on the Potomac and Chesapeake Bay—population,	557,650

Aggregate, 678,270

Suppose the whole of this population, together with the amount exported to other places, shall not amount to more than thrice the quantity consumed in the city of Pittsburgh, whose population is not one-third of that of the District of Columbia alone, scarcely two-thirds of that of the city of Washington, and the tolls at half a cent a ton per mile, would amount, on this limited quantity, to \$19,336 dollars, equal to 15 per cent. on 6,000,000 dollars, the entire cost of the canal to Cumberland. These calculations may seem extravagant, but the facts on which they are founded are well established; besides the fact is notorious, that the tolls on some of the coal canals in England amount to 40 per cent. upon the capital, and shares of stock of £100 are selling in the market for £725. The Mersey and Irwell canal is an instance of this kind. Coal is, however, but a single item; superadded to this the various other sources of revenue relied on, lime, iron, lumber, marble, merchandises, &c. and who can for a moment doubt that this canal, when it reaches the coal mines, will yield an ample revenue on the capital invested? And can the United States and the States immediately interested, hesitate to extend, at once, the aid necessary to secure the speedy extension of the canal, now two-thirds completed, to the coal mines? And the more especially when it is recollected that they have already invested more than two millions of dollars in this work, which, with three or four millions expended on the Baltimore and Ohio Railroad, must remain, in a great measure, unproductive, until the canal is carried at least to Cumberland.

But these considerations (merely pecuniary) dwindle to a point, when compared with the higher and nobler objects of uniting and binding together by the ties of interest and intercourse, the great geographical divisions of our country; of connecting, by the nearest and best communication that can be devised, the metropolis of Maryland and the seat of the Federal Government, with the great valley of the Mississippi and the Lakes, thereby attracting a portion of their rich and abundant commerce in this direction, and at the same time opening and rendering productive the richest mines of coal and iron in America, now buried and useless in the bowels of the Alleghanies. These objects alone are worth the whole sum required, even if the investment should never yield one dollar of revenue. When the canal reaches the coal mines its completion to Pittsburgh is secure—its practical results, the benefits and blessings it will every where diffuse, will commend it to the favor of all; but independent of this, the high price of the stock in the market, (at least equal to that of the Schuylkill canal, now more than 100 per cent. above par,) would at once secure the subscription by States and individuals, independent of the United States, to the balance of the stock necessary for its entire completion. If the means were now afforded to extend the work to Cumberland, it is confidently asserted by practical engineers, that the work could be completed in 18 months.

Having shown, as they trust satisfactorily, that coal alone will yield an ample revenue, the Committee will notice briefly the other sources of revenue referred to above: the second of which is

2. *Lumber.*—By referring to the various reports descriptive of the country and its resources, through which the canal passes, it will be seen that the finest forests of timber in the world are found skirting the canal for more than 180

miles of its extent, especially on the Virginia shore, where water power is found in abundance on the spot to convert it into lumber. In 1826 there were 150,226 tons of lumber transported on the New-York canal, which if carried 125 miles on the Chesapeake and Ohio canal, at a cent a ton per mile, would yield \$187,780 per annum, equal to three per cent. on the capital.

3. *Lime.*—Lime stone and coal are found together in vast quantities on this canal, under similar circumstances. Lime is made and sold at the kiln in the West for 4 cents per bushel: double this, and say it costs 8 cents, and 6 cents for transportation, the same as coal, and it can be delivered in Washington city for 14 cents per bushel. At this price it would not only supply all the common uses of lime, but constitute the cheapest and best manure to fertilize and restore to the highest state of productiveness the now barren and impoverished lands on the Potomac and Chesapeake, both in Maryland and Virginia, and of course would become a source of immense revenue on the canal, second perhaps only to coal. The amount of tolls on this article we will not attempt to estimate.

4. *Iron, Marble, and other Minerals of the Alleghanies.*—The fact that Iron ore is found in the greatest profusion, and of the best quality, in the coal region, is well ascertained, and that marble of superior quality abounds on the line of the Canal is equally certain. The beautiful marble composing the columns of the Capitol was quarried out of the bed of the Canal, about 42 miles from the city. The tolls on these articles the Committee will not undertake to compute, but it is obvious that they would be very considerable.

5. *The Fisheries.*—The revenue which may accrue from the fisheries cannot be computed with any kind of certainty; but when the facility and cheapness with which they can be transported, and the low rate at which they can be supplied at the Potomac Fisheries, no doubt it would be considerable. The price of herring is said to be 25 cents per 1000, and shad \$1.50 per 100, and the quantity is so great that fish is a common manure to enrich the lands in the vicinity of the fisheries on the Potomac. Fish could be profitably carried to Cumberland as back loading in canal boats for 25 cents per barrel to Cumberland, which is double the amount paid for coal, the weight being only equal to 2½ bushels of coal, the freight and tolls of which are estimated at 5 cents per bushel.

6. *Water Power* will be equal to almost any demand, and its productiveness must depend upon the number of manufacturing establishments which the very reduced price at which fuel, the raw materials, and the subsistence of labor, can be supplied by the canal, will bring into existence along its line, and at its termination.

7th. *The productions of Agriculture.* And 8th. *The transportation of merchandise, passengers, &c.*—The Committee will not extend their report (which they are anxious to make as brief as possible) by going into a detail of the infinite variety of facts, calculated to shew the prolific nature of these very fruitful sources of revenue. It is well known that they alone contribute most of the tolls received on the New York, Pennsylvania, and Ohio canals, deriving, as they do, very little from coal and other minerals abounding on this; besides, when we advert to the other advantages enjoyed by the Chesapeake and Ohio canal, in reference to distance, dimensions, climate, and continuity of canal transportation, no one can doubt that it will enjoy a liberal share of the commerce and trade of the Western States, whose population, judging from the past, will soon exceed that of the East; but, even if this canal were in all respects inferior to those of New York, Ohio, and Pennsylvania, their absolute inadequacy to give vent to the increasing trade and commerce of the West, resulting from its growth in wealth and population, would force upon this work tonnage equal, in time, to its utmost capacity.

Such are the bright prospects to which the patriotic and enlightened contributors to the Chesapeake and Ohio canal may confidently look forward, if the means of its completion are afforded—and the Committee appeal to every candid man to say, whether the facts stated have not fully sustained the declaration with which they set out, that this canal will afford a more profitable investment of funds than any similar work in our coun-

try—justifying an appeal even to private capital, looking alone to profit, to seek the Chesapeake and Ohio canal, as affording a more safe and productive investment of funds than any other now open to them in the United States.

Coal canals have been invariably profitable in all countries, often exceeding in tolls the most sanguine anticipations of the friends of the Chesapeake and Ohio canal. In Great Britain, the profits on coal canals have varied from 10 to 170 per cent. per annum, as appears by the following list, taken from a London price current of canal stocks, of October, 1822:

	Share.	Selling Price.	Div'd
Coventry,	£100	1070	44
Erewash,	100	1000	58
Forth and Clyde,	100	470	20
Loughborough,	100	3500	170
Neath,	100	410	25
Oxford,	100	730	32
Stratford & Worcester-shire,	140	700	40
Stroudwater,	145	995	22
Trent and Mersey,	100	1710	75
Grand Junction,	100	245	10
Leeds and Liverpool,	100	365	12

beside many others mostly employed in the transportation of coal, some of them 130 miles long, and having one-third more lockage than occurs in the Chesapeake and Ohio canal between tide water and Cumberland.

And even in this country they have been already attended with similar results. The Schuylkill canal, in 1825, when it reached the coal regions, after encountering the greatest difficulties and discouragement, its tonnage amounted to only 5,306 tons—yet, after the mines were opened, and railroads constructed to transport the coal to the canal, the tonnage increased in a few years to 445,849 tons, and the tolls to \$28,481 dollars, besides 16,673 dollars for water power, making 345,154 dollars—equal to 12 per cent. on its original cost; and the stock rose from the lowest depression to 160 per cent. above par, viz.: 130 dollars for shares of 50 dollars. The New-York canal, in 1833, after very large reductions on its tolls, yielded 1,422,695 dollars revenue, equal to 15 per cent. on 9,500,000 dollars, its original cost. In 1825 the canal commissioners reported that, according to an estimate made, the tolls would pay the whole cost of the canal in 1836; that the tolls would then amount to one million dollars per annum; that in 1846 they would amount to 2,000,000 dollars, and in 1856 to 4,000,000 dollars; and that if fully employed, they might reach 9,031,000 dollars a year, and thus far this calculation has been more than realized. The debt is already discharged, and although the tolls have been reduced nearly one-third, they amounted, in 1833, to nearly a million and a half of dollars.

Thus has New-York, by a wise policy, not only made herself "the Empire State," by increasing her population and her power, and adding countless millions to the wealth of her people and her metropolis, but she has superadded to all this an annual revenue derived from her canal, free from all charges, sufficient to discharge all the ordinary expenses of her State Government, without levying one cent of tax upon her people. And why shall Maryland and Virginia hesitate to realize similar advantages by the completion of the Chesapeake and Ohio Canal, proved by the clearest testimony to be decidedly superior, being a much shorter, more direct, and central communication from the Atlantic to the west, and possessing, in the coal trade, an inexhaustible source of profit in addition to all those enjoyed on the New-York Canal.

Were this work to be now commenced for the first time, there ought to be no hesitation. And surely, after it has been constructed in the most splendid and durable manner, surpassing any similar work in the world, for more than one hundred miles on its way to the west, shall it be suffered to stop or languish on its journey? Will its early patron, the United States, whose seat of government it connects with the valley of the Mississippi, and the Lakes, constituting an enduring bond of national union, promoting alike the national defence in war, and prosperity in peace—will she, with her ample means, suffer this noble enterprise to be arrested in its progress for want

of that aid which she can so easily afford, without creating one cent of taxation, or one dollar of debt, and the more especially, we ask, can this aid be justly withheld, when it is recollected that the subscription of a million of dollars by the United States, at the commencement of the work, was made with an express understanding, as appears by the report of the Committee, that the United States were to contribute "a moiety of its entire cost." Three millions have been subscribed with this understanding; and after individuals and corporations have been thus induced to contribute their private means to aid in the accomplishment of a great national enterprise, will it not be a violation of every principle of good faith and common honesty to withhold further aid, and thus defeat the work, and ruin the individuals and corporations induced, in this way, to embark their means with the Government in a great national undertaking? These considerations belong to the subject, and cannot be overlooked or disregarded by an enlightened and just government. Let the government, then, influenced by a liberal and wise policy, fulfil its engagements, (implied, if not expressed,) to contribute a sum equal to all others, and the means will be at once afforded to complete the work to Cumberland.

All which is respectfully submitted. In behalf of the Committee,

A. STEWART, Chairman.

The following communication is from a gentleman who is evidently acquainted with the subject upon which he writes. We wish it were as well understood, and as duly appreciated, by the citizens generally of this state, and more especially of this city—for they, more than any others, are interested in the speedy accomplishment of the works now in contemplation.

The request of R. A. J., in his private note, shall be cheerfully attended to, and we hope he will furnish us with communications frequently, in relation to a subject in which we take a deep interest, and which he so well understands.

To the Editor of the Railroad Journal:

SIR,—You have justly remarked in your valuable Journal, that many and important improvements are now in progress in Pennsylvania and some of the western states, the direct tendency of which is to draw away from New-York the immense trade of the West. There is one of these improvements which has that tendency in an eminent degree, of the operation of which, however, the citizens of New-York, and, I believe, the public, are but partially informed. A plan has been for many years maturing for uniting the Ohio and Pennsylvania canals, and the subject has been before the Legislature of those two States in various forms, for a number of years past.

The State of Pennsylvania has now completed her canal from Pittsburgh, (including the railroad portage across the Alleghany ridge,) and from the mouth of Big Beaver up to New Castle, and within about eight miles of the Ohio state line, which has reduced the distance by which this extended line of canal can be united to the Ohio canal, through the Mahoning valley, to about 85 miles. The State of Pennsylvania have declared themselves ready, at any time, to construct the canal to the Ohio line; leaving for the State of Ohio about 76 or 77 miles over a route ascertained to be eminently favorable. This junction canal joins the

Ohio canal at Akron, a very flourishing town at the Portage summit, possessing an immense water power, and destined to be an important town.

This subject is now before the Ohio Legislature, and my attention has been called to it at this time, by meeting with an able report from the Hon. Leicester King, chairman of a committee of the senate of that State, recommending the immediate construction of this important work. The committee quote from a recent report of the canal commissioners of Pennsylvania, in which it is observed, "That a cross cut canal, from Akron, on the Ohio Canal, along the valley of the Mahoning to the Pennsylvania canal, would, in the opinion of the canal commissioners, be highly beneficial to both States. It would open a direct, safe, cheap, and expeditious channel for the citizens of Ohio to send their agricultural productions to a market on the sea-board, and enable them, in return, to receive merchandise from the East. It would, by the additional commerce thrown upon the Pennsylvania and Ohio canals, give activity to trade, employment to capital, and business to merchants, traders, and boatmen; and, consequently, it would stimulate and promote the great primary interests of agriculture. Punctuality is said to be the life of business; but to be punctual to engagements requires certainty in the means by which those engagements are to be fulfilled.

"Therefore, in a contest for the rich trade of the West and North-West, we should, if possible, avoid all risks and delays, and consequently broken voyages, that may arise from either flood or low water, by having a continuous canal, from the Alleghany mountains to Lake Erie, and the Ohio river, below its principal obstructions."

The committee also remark, that the proposed canal "will shorten the distance from the point of its intersection with the Ohio canal to Philadelphia, from what it now is to New-York by the Lake and New-York canal, about two hundred miles—save the expense of a double transshipment—avoid the danger and delay of the Lake navigation—lessen the time consumed in the transmission of goods and produce from one extreme point to the other, and render it certain,—all objects of great importance in mercantile operations."

And, again, in closing their report, they observe, "When we take into view the extensive improvements which are rapidly progressing, and in contemplation, in the western part of this State and Indiana, and consider the immense amount of the productions of that vast region of country, which must accumulate during the winter season, to seek an early eastern market through those avenues in the spring, it must be the height of folly to suppose that it would await the opening of the harbor at Buffalo, when it could take this shorter, safer, and more expeditious route to the sea-board, at least five weeks earlier. Nor can they discover any good reason why it should not be preferred at all seasons of the year."

There can be little doubt that the Legislature of Ohio will order the construction of this canal, and there is nothing that presents more forcibly to the mind the importance to the city and state of New-York of those counteracting and great public works now before the Legislature, than the facts and reasoning of this report: showing not only that the business of Ohio would seek by this route the Philadelphia market, but that a large portion of the entire western trade would find the same channel. It is

manifestly for the interest of the State of New-York, before this immense trade shall have sought for itself other channels, to construct such works as will continue and extend this business through the State to its great commercial mart. And there are no more ready or obvious modes than by the railroad to Lake Erie, through the southern tier of counties—the Olean canal and the ship canal: objects, to the promotion of which, with such prudent foresight and laudable zeal, you have directed so much of your attention.

R. A. J.

The following Report was made by Wm. R. HOPKINS, Esq. to the Canal Commissioners of Canada. It is another evidence of their determination to share with us the business which now flows to this city.

To the Commissioners for improving the Navigation of the River Richelieu.

GENTLEMEN,—Having been requested by you to give my opinion as to the best manner of improving the navigation of the River Richelieu, I have to state—

That I see no other method of improvement besides the three mentioned by Mr. Fleming, that is worthy of your attention; and, in my opinion, you can only choose between the three following plans:

First—To dredge out the channel where it is too shallow, and to put two jetties into the River at St. Denis.

Second—To cut a new channel past St. Denis, as proposed by Mr. Fleming, and to lower the shoals in other parts of the channel.

Third—To put in a dam, with a lock, in some part of the river, and by it to raise the water above all but the very highest obstructions, which are to be lowered by dredging.

I shall proceed to give my views of all these plans, requesting your honorable board to bear in mind, that I depend on the correctness of the maps and levels that have been shown me.

Nothing need be said of other parts of the river besides the shoals near St. Denis; when these are improved, the other obstructions can easily be taken away, or got over by dredging, and by the dam, if one is put up.

I will consider, First—The plan of Mr. Kuper to deepen the channel, and to erect jetties.

To deepen the channel only, would do very well; but I think it would be a tedious and expensive work.

The jetties are different; they are of no use; dangerous, (in point of stability,) and detrimental in their operation. When they are short, they change the current of the river, and cause it to wear the bottom and the banks; they will probably undermine at their outer ends, and be torn away, and by these means partly remedy the evils they have occasioned. When they are long, and occupy most of the width of the river, they will raise a head of water, and act as a dam; but, from having a space left open in the river bed, they will be less secure than a dam, although equally expensive, for when ice is passing in the river, it will crowd with the water into this opening, and will act with great force against the point of the work. From this danger, a dam is exempt.

The plan next in order, is that of Mr. Fleming—No. 2.

This plan is sensible, and easy of execution; and will be, as I think, an effectual improvement.

A canal from the head of the shoal near St. Antoine, to deep water below St. Denis, along the west shore of the river, can have no objection made to it, that will have much weight. I think the following plan rather better, but there is little difference in the plans.

It is objected, that mud from the land drains will fill this cut, but I do not think so; the current will keep it clear in all probability, and the mud that does not go away with the current, can easily be removed with scrapers, before it accumulates to any serious extent.

The last plan is that of a dam and lock—No. 3.

This plan is, I think, the best, all things considered, for two reasons:

1st. It will improve the whole width of the river, more or less.

2d. It is the cheapest mode of effectually improving the river.

As to the place for the dam and lock, I choose the island marked B, on the map, as the best. Here the water is shallowest, making it the least expensive point to erect a dam upon; and as the river divides into two branches, one of which can be shut by a bank of earth, the dam need not be very long.

As the Commissioners have prepared materials, and began works here, it will save cost to continue the works at this point.

Mr. Fleming objects to a dam,—

1st. That it will raise the water and injure the river bank.

2d. That deposits will form in the pool of the dam.

3d. That dams are insecure.

As to the first objection, it will have little weight. It is only proposed to raise the water two feet by the dam, in any, except very low water, when float boards are on the dam to raise two feet more water.

For the greater part of the last five years, the water has been as high as it would have been during the five years before that, had the dam then been in. Yet it does not seem that the banks have fallen rapidly of late years. A dam in high water produces much less effect than it does in low water; for when the water is high, it passes a low dam as it would a shoal in the river bed, without a great break in the current.

As to the second objection,—

The deposit cannot be serious, or it would before this have begun to form mud islands, as there is dead water enough now in the river for them to make in, was there any tendency in this way.

As to the third objection,—

Dams are certainly more exposed to accident than any other works within the range of civil engineering. But with proper care in their construction, they need not fail, when not too high; and four feet is a very low dam.

#### Manner of locating the work.

I would recommend a bank of earth to be carried from the island marked B on the map, to the east shore of the river. (As Mr. Kuper has begun a work there, we may as well follow his line.) This bank must be fifteen feet wide on top, to slope two and a half feet to one horizontal on both sides. The upper side must be protected well with a slope wall.

This bank must be carried from shore to shore, and its top must be two feet above high water mark. This stops the east channel.

The west channel is to be shut by a dam formed of crib work, filled with stone, and

well sheet pited; the top must be covered with four inch plank, on which eyes must be secured, to which the irons of the float boards are to be attached; an apron is to be made below the dam, and all the work done according to the specification and plan forming a part of this Report.

The ends of the dam are to be well secured with abutments of cut stone.

The place for the lock I cannot now permanently fix. I must examine further, if I am to decide this point. By the maps, the place most suitable is on the east side of the island, marked B on the map. I would deepen the water, that boats might pass freely from deep water above the dam to deep water below it, a distance of about the half of a mile. This can be no very serious affair.

The lock will be two hundred feet in the chamber, by fifty feet wide between the gates. It is unnecessary, in a lock like this, to go to all the expense that would be incurred if the lift were greater. I therefore propose to make the lock with cut stone work around the gates only, leaving the chamber walled only with rough stone, laid dry, which will form a very permanent and cheap work.

In the plans I have the honor to submit, and in the above Report, I have meant to lay before you the means of forming a permanent work, and one that will properly connect the waters of the St. Lawrence with the Basin of Chambly, that can be speedily made, and that will need few repairs.

I am, gentlemen, truly, your most obedient humble servant,

WM. R. HOPKINS,  
Civil Engineer.

**RAILROAD MEETING.**—At a numerous and respectable meeting of the inhabitants of the town of Monroe, friendly to the construction of the contemplated New-York and Erie Railroad, convened pursuant to previous notice, at the house of De Witt McGarrah, on the 17th day of January, Joseph R. Andrews was appointed President, Lewis H. Roe, 1st Vice President, James Cromwell, 2d Vice President, and Matthew B. Sweezy, and Jas. Gray, Jr. Secretaries. On motion, the object of the meeting having been stated, it was

Resolved, That E. B. Carpenter, Hudson McFarlan, Genest Roe, Peter Ball, and John Seaman, together with the officers of the meeting, constitute a committee to prepare a memorial to the legislature, and to draft resolutions expressive of the sense of this meeting; who reported the following preamble and resolutions, which were unanimously adopted.

Whereas, the contemplated New-York and Erie Railroad is destined, by its construction, to make a speedy communication between the City of New-York and Lake Erie, and to enlarge the commercial business of that city, by bringing to its market a great portion of the products of the adjoining western States, and which will open a great thoroughfare through the southern tier of counties of this state, now secluded by their local situation from the benefits of a ready market, and not possessing the advantages given by nature or art to most of their sister counties, and whereas we highly approve of the system of Internal Improvement adopted and pursued by the State of New-York, for many years past, which has so much exalted the character of the State, and developed the enterprise and liberality of our citizens, and secured to the present as well as future

generations many important and lasting benefits,—therefore

Resolved, That we highly approve of the contemplated Railroad from Lake Erie to the City of New-York, and that we believe the inhabitants of the respective counties through which it is to pass have just and equitable claims on the liberality and patronage of the State for aid to carry the same into effect.

Resolved, That this meeting approve of the proceedings of the meeting held at Bath, Steuben County, on the 17th of December last, and that we will memorialize the Legislature agreeably to their recommendation.

Resolved, That the representatives in the Legislature from this county be requested to use their exertions to procure the passage of a law authorising subscriptions on the part of the State, of two millions of dollars of stock, or loan their credit to that amount.

Resolved, That it be recommended to the different towns in this county to hold meetings and circulate memorials to be presented to the Legislature, praying for aid agreeably to the recommendation of the Bath convention.

Resolved, That the following persons constitute a committee to circulate memorials for signatures in this town: Hudson McFarlan, E. B. Carpenter, John Seaman, Jas. Ball, Jas. Gray, Jr. Mills, Hughes, T. G. Wilkes, Joseph M. Shuit, Peter Turner, and Samuel Hughes.

Resolved, That the proceedings of this meeting be signed by the officers thereof, and published in the county papers, and Railroad Journal, in the city of New-York.

JOSEPH R. ANDREWS, President.  
LEWIS H. ROE, 1st Vice President.  
JAS. CROMWELL, 2d do.  
MATTHEW B. SWEETZ, } Sec'y.s.  
JAS. GRAY, Jr. }

The Legislature of Louisiana convened on the 5th. Charles Derbigny was elected President of the Senate, having received all the votes except one blank, Alcee Labrousche was unanimously re-elected Speaker of the House. On the 6th, Edward D. White was elected Governor of the State, having received 58 votes,—the whole number except three blanks. Gen. Dawson had declined being considered a candidate.

It appears from the Message of Governor Roman, that the receipts into the State Treasury during the past year, amounted \$582,254; expenditures \$500,867. The value of exports from Louisiana in 1834 amounted to the extraordinary sum of \$35,819,185; which is almost double the value of exports from the whole United States in 1760. The exports in 1835 the Governor estimates at about \$40,000,000, including 500,000 bales of cotton, 100,000 hhds of sugar, and 25,000 hhds of tobacco.

He warmly recommends the system of internal improvements throughout the State, and particularly the contemplated Rail Road from New Orleans to Natchez.

He also strongly recommends (says the New Orleans Bulletin,) that the warehouse system be adopted in New Orleans as in New York; for its advantages are many and certain.

The exports hence to Mexico are valued at nearly \$3,000,000 a year, and the imports at \$6,000,000.

The epidemical sickness of this city, (New Orleans) he attributes to the malaria from the swamp between this place and Lake Ponchartrain, and warmly urges the Assembly to adopt means for draining it.

He thinks that by removing the obstructions on the Alchatalya, the lands on the confines of that river will be increased one million dollars in value; and that Louisiana should not be so public spirited or squeamish as to hesitate longer to ask grants of lands from Congress, as well as other States.

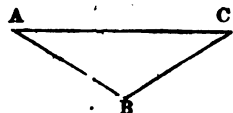

[From the Journal of the Franklin Institute.]

Report to the Board of Directors of the London and Birmingham Railway, on the Formation of a Railway by Undulatory Planes. By ROBERT STEPHENSON, Esq., Engineer. Dated 5th May, 1834.\*

Since the receipt of the memorial to the directors, respecting the formation of railways by undulatory planes, I need scarcely say that I have been so closely occupied, that I found it impossible to reconsider, carefully, the opinions I had formed on the subject several months ago, founded upon some experiments in "The Gallery of Practical Science," with a model prepared by Mr. Badnall. These experiments were considered by several persons conclusive in favor of an undulatory surface for a line of railway.

I drew a different conclusion from them, and made some remarks and calculations at the time, which I considered fully confirmed it. Since that time, I have read the greater part of the controversy, which has been carried on in the "Mechanics' Magazine," and paid especial attention to the experiments made upon the Rainhill plane, with several of the locomotive engines belonging to the Liverpool and Manchester Railway Company, without perceiving any reasons for changing the view I originally took.

The following observations are extracted from those above alluded to, as far as appears necessary for explaining the outline of the arguments upon which I had based my views:

A C, a horizontal plane.

A B, and B C, two inclined planes completing one undulation.

A carriage, in moving over the inclined plane, may be conceived to be acted upon by three forces, viz.

First.—Gravity, varying directly as the sine of the angle of inclination.

Secondly.—Mechanical force, such as a steam-engine, or a spring.

Thirdly.—The uniform retarding force, arising from the friction of the moving parts.

Let  $n$  = sine of angle of inclination.

$g$  = force of gravity.

$m$  = mechanical force applied.

$f$  = retarding force arising from friction.

Then the force resulting from the combined action of these three, will be represented by  $ng + m - f - (m - f)$ ; it is evident that the motion of the body is influenced solely by the remaining force  $ng$ , and is precisely in the same condition as if friction were annihilated.

In this case, it is evident that the body descending the plane A B, would acquire sufficient momentum to carry it up to the similar plane B C; and were there a series of similar undulations, the body would move

forward without interruption, and the velocities in each succeeding undulation would be the same, and the expenditure of mechanical power would be the space passed over, multiplied into the retarding force  $= sm$ , or  $sf$ ,  $s$  being the space passed over.

Instead of moving on an undulating surface, let the body be now placed on the horizontal plane A C; its motion in this condition can be influenced by two forces only, viz. the mechanical force  $m$ , and the retarding force  $f$ . If we suppose, therefore,  $m = f$ , it is obvious that no motion whatever can take place.

At this point of the comparison, a striking difference, and apparently not an unimportant one, exists between the undulatory and horizontal surfaces. In the former, gravity communicates a certain velocity, which is maintained throughout each succeeding undulation; whereas, in the latter, the forces  $m$  and  $f$  merely destroy each other; consequently the body remains stationary.

This explains the experiment which was frequently repeated, and in many cases went far to convince several persons of the advantage of having an undulatory surface. Very little reflection, however, is requisite to perceive that this advantage is merely apparent, and not real: for let us suppose that the body at A, on the horizontal plane, has the mean velocity given to it, which gravity imparts to the body moving down the first inclined plane of the undulatory surface; it will then move uniformly with this velocity from A to C, and arrive at the latter point at the same time that it would have done on the undulatory line; and however the length may be increased, the body will pass over the distances corresponding to each undulation in the same space of time, whether the surface be undulatory or horizontal.

Let  $p$  = power expended in communicating any given velocity to the body on the horizontal surface at A; then the whole power expended in moving the body from A to C, will be  $p + sm$ , or  $p + sf$ .

But when the body arrives at C, it retains its original velocity, and is capable of employing its power, or of moving itself beyond C; whereas, on the undulating surface, the body becomes quite stationary at C. In short, it is a well known law in mechanics, that the velocity which the body possesses, is exactly equal to the power expended in communicating it; we therefore have the absolute expenditure of power in moving the body from A to C  $= sm$  or  $sf$ , which is precisely the same result as on the undulating surface.

Hitherto we have the forces  $m$  and  $f$  equal, by which the friction, or retarding force, was merely neutralized; but in practice,  $m$  must exceed  $f$ , otherwise no motion could ensue on the level plane. When, therefore,  $m$  is greater than  $f$ , the body will be accelerated by the differences of those forces, viz.  $m - f = d$ ; in this case the motion of the body on the undulatory surface is influenced by a force represented by  $ng + d$ .

If  $v$  and  $v''$  represent the velocities generated by the forces  $ng$  and  $d$ , in the same

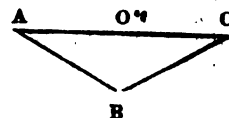

time, then  $v + v''$  will represent the velocity which the joint forces will generate in an equal space of time. But the velocity given by the force  $ng$ , in descending, is lost in ascending; hence, the body will arrive at the summit of each undulation, with the velocity due to the action of the force  $d$ , which is  $\sqrt{2ds}$ .

Now, the velocity acquired by the action of the force  $d$  on the level plane, the body having moved over an equal space, is also  $\sqrt{2ds}$ ; and this equality in velocity must hold, whatever be the nature of the surface over which the bodies move, undulatory or level.

If the body were actually propelled by the force  $d$ , more efficiently on the one surface than on the other, it must arrive at the point C, with different velocities. The readiest mode of showing that this is not the case, is to allow it to expend the momentum by moving along a horizontal plane, or one of a given inclination; in both cases, the momentum is precisely equal. This experiment I repeated several times, and felt perfectly convinced that the results were exactly determined.

It has been urged by some that the undulatory surface has an advantage from the friction being reduced, in consequence of the body being on an inclined surface. A moment's consideration will show that this never can apply in practice, from the smallness of the inclination which is admissible; the reduction in the friction from this cause would be inappreciable.

But even allowing it to operate, the undulating surface is increased in length by a quantity that exactly compensates for the reduction in the friction of the carriage.

Because the diminution of friction is proportioned to the diminution of weight, which is as A B, A O, but the spaces passed over are as A C: A B + B C, or as A O: A B, exactly the reverse of the former proportion; showing, that though the friction may be reduced on the inclined plane, the distance is increased precisely in a ratio to compensate it.

The above considerations lead me to conclude that, theoretically, there is neither advantage nor disadvantage in the use of an undulating surface for a line of railway; the question, therefore, resolves itself into one of practical application. This I have frequently and carefully considered, and, generally, with a strong bias in favor of Mr. Badnall's view, because I saw clearly that its introduction would at least reduce the expense of constructing public lines of railway; but I have invariably been compelled to conclude that its adoption would be attended with greater expense in the carriage, greater uncertainty in the operation, in many cases greater inconvenience, and in all greater risks of accidents, than in a horizontal line of railway, or one approaching to it as nearly as circumstances would permit.

Greater ultimate expense, I conceive,

\* We have received from Mr. Stephenson, in addition to the manuscript now printed, one containing remarks and calculations on the best form for railway bars, &c., the publication of which we propose to commence in the next number.

would arise in part from the additional wear and tear, both upon carriages and engines, from the varying velocities which must be continually taking place throughout the whole length of the line of road.

This objection is considered by many of no weight; I need only refer, however, to practical men, who have been in the habit of observing the destruction of machinery where varying velocities are admitted; indeed, I cannot refer to a better instance than Rainhill and Sutton inclined planes, where the objectionable nature of inclined planes is evident to all conversant with machinery, and from whence (it is probably not too much to say) a very large portion of the wear and tear of the locomotive engines on the Liverpool and Manchester Railway has sprung.

The engines on an undulating line must obviously, at the bottom of each undulation, attain a velocity considerably greater than what is required upon a horizontal line, where it may be nearly uniform.

Now, in locomotive engines, this single circumstance gives rise to three separate objections, neither of which is undeserving of attention, and which are distinct from that of wear and tear arising simply out of velocity.

First.—In the construction of these machines, it is a consideration of the very first importance, to proportion and adapt the relative speeds of the different parts to the velocity at which the engines are intended to travel; and though I am perfectly aware that these engines are worked at different rates of speed, I have seen sufficient to convince me that uniformity in the velocities is extremely desirable, and that they never perform so economically as when the intended velocity is adhered to within very narrow limits, which is quite impracticable on an undulating road.

Secondly.—When the velocity of these engines exceeds that for which they are calculated, the steam acts less forcibly on the pistons, and thus produces an absolute loss of power, or, in other words, an increased consumption of fuel.

Thirdly.—From the present construction of locomotive engines, every different speed of travelling is accompanied with a corresponding increase or diminution of the temperature of the fire, which occasions a continual working amongst the different parts of the boiler, from unequal expansion and contraction, which never fails in a short time to render the boiler more or less leaky.

Every experienced steam-engine builder has had instances brought under his observation, of the destruction of boilers by being exposed to great variations of temperature. In all railways, except such as are perfectly horizontal, this objection applies with more or less force. I therefore only mention it in this place, to show the tendency of the undulating railway would be to aggravate the evil arising from great inequalities in the temperature.

These are my principal reasons for concluding that the expense of carriage would be greater on an undulated line, and the same remarks appear to me to lead to the conclusion, that there would be greater uncertainty in the operation.

Inconvenience would, in my opinion, result from not having the power to halt at any given point on the line of railway. This may be done without inconvenience, on a line of road not possessing inclinations beyond the power of the engines; but where the inclinations of the planes exceed that power, it is clear that some expedient must be contrived to overcome the delay that must ensue. I have only heard of one, which I cannot suppose to have been advanced seriously. I allude to the proposal that an engine, when stopped by any chance on an inclination beyond its power, should be worked backwards and forwards until sufficient momentum be acquired for surmounting the next summit.

This is an operation not only of time, but in many cases would be imminently dangerous, and could not fail to be a continual source of annoyance.

When it is stated that the risk of accident would be increased, it must not be inferred that increase of speed is attended with greater frequency of accident, but rather that such mishaps are likely to be more extensive and serious when they do occur.

I now come to consider more immediately the chief object of the memorial which has been laid before the directors, viz. The expediency of making an experiment on the London and Birmingham Railway, extending over a distance of eight or ten miles, as suggested by Dr. Lardner and Dr. Dalton.

In recommending the directors to make such an experiment, those gentlemen have evidently been influenced by the statement in the memorial, that it would not cost over £500, and that the experiment, should it fail, would be productive of no detriment to the Railway Company.

I have thoroughly considered the expense of such an experiment, and also the probable inconvenience that would arise out of its failure, and supposing the latter result, I am satisfied it could not cost the Railway Company less than £8,000 or £10,000; and this sum may be made to appear without taking into the account many contingencies that would necessarily attend such a circumstance.

The ballasting and laying the rails alone costs from £800 to £1,000 per mile, and this charge must unquestionably be incurred in merely transforming the undulated surface to an uniform one. The embankments would require to be brought to a higher, and excavations to a lower, level; thus interfering with the whole of the bridges, over and under the railway.

In short, you could only prepare for the contingency of a failure, by erecting temporary bridges over the railway, throughout the ten miles, until the utility of the scheme had been determined.

These, and other considerations, connected with the detail of executing the railway, which it would be superfluous to enter into here, and which it would be impossible to render intelligible in a report like the present, fully convince me that it would be at least rash to advise an expensive experiment on the London and Birmingham Railway, which, in any event, could only save a very small sum in the original expenditure.

ture, with the possibility of your not succeeding to your expectations; thus producing a result fraught with mischief to the undertaking generally.

I feel it, however, due to Mr. Badnall, to state that I consider a trial upon some branch road might be made with advantage, as the adoption of his ideas would certainly be productive, in many cases, of considerable saving in the first cost, which, in some branch roads, is of paramount importance.

I must, however, again repeat, that no saving of power could be by any possibility effected.

ROBERT STEPHENSON.

#### GREAT BLAST AT CRAIGLEITH QUARRY.—

The long time in which preparations for a great explosion at this quarry have been going on, and the effects that were expected to result from the experiment, by a great saving of labor and expense, in at once dislodging a great mass of rock, and also lessening, if not altogether removing, the risk which attends the blowing up of small portions of rock from the flying fragments, rendered the experiment which took place on Saturday se'ennight, (18th Oct. 1834,) a subject of much interest both in a public and scientific point of view. It having been intimated by bills that the blast was to take place at three o'clock, long before that hour crowds of people were proceeding along the roads leading to the quarry, and by three o'clock every place which commanded a view of the spot was filled with spectators. At the time when the explosion took place, there was no fewer than ten thousand people on the grounds around the quarry; and curiosity was so much excited, that even on the Castle-hill, and also on the Corstorphine hill, a great many people were collected. At half-past two o'clock, the conductor, enclosed in a block-tin tube, 26 feet long, and half-inch diameter, was introduced into the bore. The depth of the bore was 60 feet, and 7½ inches diameter at top, and 6 at the bottom, and was charged with 500 lb. of Sir Henry Bridge's double-strong blasting powder. At half-past three the match was lighted, and in three minutes the explosion took place. The report was not so loud as from a small piece of ordnance; but the effect that was produced was highly satisfactory to all the scientific gentlemen present, and completely fulfilled the expectations that had been conceived by the projector. At the moment of explosion, the great mass of rock appeared to those at a short distance to be forced upwards, and then, to rend in large and deep fissures. It is calculated that upwards of 20,000 tons of solid rock have been displaced by this experiment. The plan seems to be perfectly safe and practicable, and, we understand, was conducted and carried through by Mr. Millar, who, in 1824, after the great fire in the Parliament Close, suggested and carried into effect the blowing up of the gable of the high land which overlooked the Cow-gate. Among the scientific gentlemen who were present, we observed Mr. Jardine, Mr. Playfair, Professor Wallace, Professor Forbes, Mr. Stevenson, Mr. Buchanan, and Mr. Grainger. —[Edinburgh Observer.]

Without female society, it has been justly said, that the beginning of men's lives would be helpless, the middle without pleasure, and the end without comfort.

He who has found a friend in whom he can unreservedly confide, may consider himself as distinguishedly blessed; for a true friend is the greatest of all possible acquisitions.

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, FEBRUARY 7, 1893.

**ATLANTIC AND NEW ORLEANS SEABOARD LINE COMPANY.**—We had occasion, during the last summer, to refer to this new, contemplated, route to New-Orleans, (see vol. iii., No. 31, Aug. 9, of this Journal)—and, from the information then before us, were disposed to think favorably of it. Some time after, and during a long absence of the Editor in the country, a communication, signed "Civis," was received, in which doubts were expressed as to the feasibility of the route. This communication, which we now publish, (see page 66,) was mistakid, and only recently came to light. We also publish in this number, several other articles relating to the route, with one or two short extracts from the charter of the company, and ask attention to the subject, as it is one in which many of our citizens are much interested.

Books are, we understand, to be opened in this city for subscriptions to the stock, of which the customary notice, we presume, will be given.

**NEW-YORK AND ERIE RAILROAD.**—On the 4th instant, an election took place to fill vacancies in the Board of Directors, after which Mr. JAMES G. KING was elected President in the place of Mr. ELIAHAR LORD, who resigned the office. The following gentlemen now compose the Board of Directors, and they will, we are sure, give character, and ensure success, to the undertaking.

James G. King, John Duer, Gould Hoyt, James Beerman, S. B. Ruggles, Stephen Whitney, P.

G. Stuyvesant, George D. Wickham, Eleazar Lord, Peter Harmony, John G. Coster, Michael Burnham, Elihu Townsend, John Rashbone, jun., J. G. Pearson, Jeremiah H. Pierson, Joshua Whitney.

On the last page may be found an account of the proceedings of the Board at their last meeting.

**AUBURN AND SYRACUSE RAILROAD.**—The following gentlemen were, on the 20th Jan., chosen by the stockholders, directors of this company. They hold their office until the first Monday of June, 1893:

Nathaniel Garrow, Elijah Miller, Geo. B. Throp, John M. Sherwood, Stephen Van Anden, Richard Steele, John Seymour, Abijah Fitch, Edward E. Marvin, Asaph D. Leonard, Vivus W. Smith, Henry Raynor, and Allen Warden.—[Syracuse Constitutional list.]

**IMPORTANT TO MERCHANTS AND TRAVELLERS.**—The Pittsburg Advocate of Thursday last, contains an advertisement, from which we learn that some enterprising gentlemen of that city have determined to establish a daily line of steamboats between Pittsburg and Louisville! Thirteen steamboats will be attached to the line, which will commence regular trips on the 23d of February. A boat will leave Pittsburg daily, at 10 o'clock A. M., Wheeling at 10 P. M., and Cincinnati at 5 P. M. touching, as far as is practicable, at intermediate places, at regular hours.

[From the Albany Argus.]

**AMOUNT OF TAXABLE PROPERTY IN THE STATE, AND THE AMOUNT PAID FROM THE GENERAL FUND TO THE CANAL FUND.**—We copy the following statement taken from a report made to the Senate by the Comptroller, on Saturday, in answer to a resolution of that body:

"The taxable value of the real and personal estates of the people of this State, as ascertained by the assessments for the year 1894, is as follows, viz:

Real estate,	\$345,463,230
Personal estate,	707,599,971

Total, \$1,053,063,201

"The statement marked B. exhibits the amount of capital stock of all the corporations in the State liable to taxation, and the real estate held by each; arranged under the heads of the several counties in which the corporations are situated.

"There may be corporations in the State liable to taxation, which are not included in this list,

although great pains have been taken for the last year to obtain returns from all existing corporations. One, and to get information in relation to those which had become extinct. To effect this object, a list was made out in

found in the session period of 49 years, as such as had not made turns required by the list made out contains portions of every of those now in existence given in the statement and fifty-one. There pike, manufacturing a ration in the State which list reported, for the are not such as to a great number of the ed have become extinct.

"The capital of all the corporations in the State liable to taxation, amounts

\$52,998,918 81

"The amount of stock held by the State, or literary or charitable institutions, amounts to the sum of

\$38,600 00

"Leaving a total amount of stock and real estate liable to taxation, in all the incorporated communities in the State, of

\$52,366,391 81

"The total amount of real estate held by all the corporations which are liable to taxation, is \$3,889,857 78, which sum is embraced in the total of taxable capital as stated above.

"The taxable property of the State may be classed as follows, viz:

Real estate owned by corporations,	\$3,889,857 78
Amount of stock for which corporations are taxed	48,483,534 63
	\$52,366,391 81

Real estate other than that owned by corporations, \$41,520,572 22

Personal estate other than that assessed to corporations, 59,116,486 97

\$40,696,060 19

Total, as shown above, \$43,009,261 00

"The amount of the contributions from the general fund to the Erie and Champlain canal fund, from 1816 to 1894, are as follows, viz:

Vendue duty,	\$9,192,001 61
Salt duty,	1,872,200 00
Avals of land sales, (Grand lot and, &c.)	63,543 00
Appropriations from Treasury,	42,957 00

Total, \$4,172,698 10

**RAILROAD CONVENTION.**—We annex the proceedings of a Railroad Convention held at White Pigeon, M. T. on the 6th of January, 1835, and hope to learn that their application to the War Department for a survey of the route proves successful.

At a meeting of the Railroad Convention, convened at the house of Dr. Rowley, in White Pigeon, on Tuesday, the 6th inst., for the purpose of devising means for uniting Lakes Erie and Michigan by a Railroad, Neil M'Gaffey, was appointed Chairman, and Joseph L. Jernegan, Secretary.

The following named gentlemen appeared and took their seats as Delegates:

From White Pigeon, Neal M'Gaffey, Isaac Adams, Robert Clark, Jr. Mr. Judson, David Clark, Charles Kellogg, and H. Loomis.

From Constantine, W. T. House, and E. P. Clarke.

From Mottville, H. L. Stewart, and Elias Taylor.

From Michigan City, Ia., William Teall, and David Sprague.

From St. Joseph county, Ia., G. W. Fowler.

From Goshen, Ia., Joseph L. Jernegan, James R. M'Cord, and John D. Defrees.

From Elkhart, Ia., George Crawford, William A. Nelson, and P. S. Kenyon.

From Perryburgh, Ohio, Willard V. Way, and Abner N. Olney.

From Lagrange Co. Ia., C. C. Ward, E. Littlefield, and T. Gale.

From Toledo, M. T., Stephen B. Comstock, and Andrew Palmer.

From Bristol, Ia., L. M. Alverson.

The object of the Convention having been explained, it was, on motion,

Resolved, That the importance of a railroad from the navigable waters of Maumee river to the south end of Michigan lake, demands a vigorous effort on the part of those residing in the vicinity of the route.

Resolved, That a committee of five be appointed by the Chairman to draft a memorial to Congress expressive of the views of this Convention, and praying for the survey of the route contemplated by the last resolution.

Resolved, That we view with pleasure the efforts making in New-York to connect the city of New-York with Lake Erie by a Railroad, and that we consider it of great National importance, that a continued road should be made on the shore of Lake Erie, to connect with the contemplated road from the navigable waters of Maumee river to the southern extreme of Lake Michigan.

Resolved, That this Convention solicits the co-operation in this work, of the States of Ohio, Pennsylvania and New-York, and that we will use all suitable means to encourage its commencement and completion.

Resolved, That Philander Chase, Joseph L. Jernegan, and Neal M'Gaffey, be appointed a corresponding committee to communicate with the Secretary of War, and such other persons as may be able to afford assistance in the furtherance of the objects of this Convention.

Resolved, That the proceedings of this Convention be published in the Michigan Statesman, and in such other papers in the states of Ohio, Indiana and Illinois, as may be disposed to promote the objects of this Convention; and that a copy be forwarded to the delegate in Congress from M. T., and to those Representatives in Congress whose constituents are interested in the accomplishment of the work.

N. M'GAFFEY, Chairman.

JOS. L. JERNEGAN, Secretary.

#### Rates of Toll.

At a meeting of the Canal Board, at the Comptroller's office, in the city of Albany, on the 22d January, 1835, the following rates of toll were established, in lieu of the rates heretofore established by this Board.

No.	Provisions.	Cts. m. fr.
1.	On flour, salted beef and pork, butter and cheese, beer and cider, per 1000 pounds, per mile,	0 4 5
2.	On bran and ship stuffs in bulk, per 1000 pounds per mile,	0 4 5
<i>Iron, Minerals, Ores, &amp;c.</i>		
3.	On salt manufactured in this state, per 1000 pounds per mile,	0 2 3
4.	On foreign salt, per 1000 pounds per mile,	3 0 0
5.	On gypsum, the product of this state, per 1000 pounds per mile,	0 2 5
6.	On brick, sand, lime, clay, earth, leached ashes, manure and iron ore, per 1000 pounds per mile,	0 2 5
7.	On pot and pearl ashes, kelp, mineral coal, charcoal, pig iron, broken castings and scrap iron, per 1000 pounds per mile,	0 4 5
8.	On stove and all other iron castings, going to or from tide water, per 1000 pounds per mile,	0 5 0
9.	On copperas and manganese, going towards tide water, per 1000 pounds per mile,	0 5 0
10.	On bar and pig lead, going towards tide water, per 1000 pounds per mile,	0 4 5
<i>Furs, Peltry, Skins, &amp;c.</i>		
11.	On furs and peltry, except deer, buffalo and moose skins, per 1000 pounds per mile,	1 4 0
12.	On deer, buffalo and moose skins, per 1000 pounds per mile,	0 7 5
13.	On sheep skins and other raw hides of domestic animals of the United States, per 1000 pounds per mile,	0 4 5
14.	On imported raw hides of domestic and other animals, per 1000 pounds per mile,	9 9 0
<i>Furniture, &amp;c.</i>		
15.	On household furniture, accompanied by, and actually belonging to, families emigrating, per 1000 pounds per mile,	4 5
16.	On carts, wagons, sleighs, ploughs and mechanics' tools, necessary for the owner's individual use, when accompanied by the owner, emigrating for the purpose of settlement, per 1000 pounds per mile,	0 4 5
<i>Stone, Slate, &amp;c.</i>		
17.	On slate and tile for roofing, and stone ware, per 1000 pounds per mile,	0 5 0
18.	On all stone wrought, or unwrought, per 1000 pounds per mile,	0 2 5
<i>Lumber, Wood, &amp;c.</i>		
19.	On timber, squared and round, per 100 cubic feet per mile, if carried in boats,	0 5 0
20.	On the same, if carried in rafts, per 100 cubic feet per mile,	1 5 0
21.	1st—On boards, plank, scantling, and sawed timber, reduced to inch measure, and all siding, lath, and other sawed stuff less than one inch thick, carried, in boats, (except such as is enumerated in regulations number 23 and 32,) per 1000 feet per mile,	0 5 0
22.	2d—On mahogany, (except veneering,) reduced to inch measure, per 1000 feet per mile,	1 5 0
23.	On the same, if transported in rafts, per 1000 feet per mile,	2 0 0
24.	On sawed lath of less than five feet in length, split lath, hoop poles, hand spikes, rowing oars and broom handles, per 1000 pounds per mile,	0 2 0

24.	On staves and heading, transported in boats, per 1000 pounds per mile,	0 2 0
25.	On the same, if transported in rafts, per 1000 pounds per mile,	0 5 0
26.	On shingles per M. per mile, carried in boats,	0 1 0
27.	On the same, if conveyed in rafts, per M. per mile,	0 4 0
28.	On split posts, and rails for fencing, per M. per mile, carried in boats,	2 0 0
29.	On the same, if conveyed in rafts, per M. per mile,	8 0 0
30.	On wood for fuel, (except such as may be used in the manufacture of salt, which shall be exempt from toll,) and tan bark, per cord per mile,	1 0 0
31.	On the same, if transported in rafts, per cord per mile,	2 0 0
32.	On sawed stuffs for window blinds, not exceeding one-fourth of an inch in thickness, per 1000 pounds per mile,	0 5 0

#### Agricultural Productions, &c.

33.	On cotton, per 1000 pounds per mile,	0 4 5
34.	On live cattle, sheep and hogs, per 1000 lbs. per mile,	0 5 0
35.	On horses, (and each horse when not weighed, to be computed at 900 pounds,) per 1000 pounds per mile,	0 5 0
36.	On rags, per 1000 pounds per mile,	8 4 5
37.	On hemp and tobacco, going towards tide water, per 1000 pounds per mile,	0 4 5
38.	On hemp, going from tide water, per 1000 pounds per mile,	0 4 5
39.	On wheat and all other agricultural productions of the U. States, not particularly specified, and not being merchandize, per 1000 pounds per mile,	0 4 5
40.	On merchandize,	0 9 0

#### Articles not enumerated.

41.	On all articles not enumerated or excepted, passing from tide water, per 1000 pounds per mile,	0 9 0
42.	On all articles not enumerated or excepted, passing towards tide water, per 1000 pounds per mile,	0 4 5

#### Boats and Passengers.

43.	On boats used chiefly for the transportation of persons and navigating the Erie Canal between Schoenectady and Utica, per mile,	11 0 0
44.	On boats used chiefly for the transportation of persons, and navigating the Erie Canal, west of Utica, per mile,	6 0 0
45.	On boats used chiefly for the transportation of persons, and navigating the Champlain or Champlain and Junction Canal, per mile,	6 0 0
46.	On boats used chiefly for the transportation of persons, and navigating the Oswego Canal, per mile,	6 0 0
47.	On boats used chiefly for the transportation of persons, and navigating the Cayuga and Seneca Canal, and the lateral canal to East Cayuga village, or either of them, per mile,	6 0 0
48.	On boats used chiefly for the transportation of persons navigating the Junction Canal, and not connected with regular lines of boats for the transportation of persons on the Erie or Champlain Canals, per mile,	50 0 0
49.	On boats used chiefly for the transportation of property, per mile,	2 0 0
50.	On each person over eight years of age, transported in a boat used chiefly for the transportation of persons, per mile,	0 2 0
51.	On each person over twelve years of age, transported in a boat used	

chiefly for the transportation of property, per mile, 0 2 0  
Resolved, That articles of the manufacture of the United States, coming towards tide water, are to be charged as heretofore, at the rate fixed for non-enumerated articles coming towards tide water.

Resolved, That the foregoing rates of toll be, and they are hereby established; and that the same be hereafter charged and collected on the several canals of this State, in lieu of all rates of toll heretofore established upon any or either of the said canals, or any part thereof.

[From the Asiatic Journal.]

**THE OVERLAND JOURNEY FROM INDIA.**—Dr. James Burnes, who was one of the passengers in the Hugh Lindsay steamer, from Bombay, in letters to his friends, extracts of which are given in a Scotch paper,\* has furnished an account of the voyage and journey, from whence we extract some of the most material circumstances.

The steamer sailed on the 1st February, under the command of Capt. Wilson, with an agreeable party of passengers.† She carried thirteen days' supply of coal; her average sailing was not more than six knots an hour, varying from four and a half to eight, although the weather was fine. From Cape Fartash, which was described on the 9th, the steamer skirted the Arabian shore, along a gloomy and thinly peopled coast. On the 11th, she took in a supply of coals at Maculla, a paltry town of dirty hovels, overlooked by barren mountains of great height, and inhabited by 1,000 or 1,500 half naked savages, most of whom were armed with swords, daggers, and shields. On visiting the Sheikh or governor and his son, whom they found seated on a mat in the corner of a wretched apartment, during the interview, some negroes among the attendants were offered them for sale by persons in the room.

Owing to the rejoicings for the termination of the Ramazaan, the coals could not be got on board till the 13th, when the Hugh Lindsay weighed anchor, and on the 15th entered the Red Sea, the weather being unusually fine; but the next day her progress was checked by a strong N. W. gale off the desert island Jebel Zyghar, and Captain Wilson put back to Mocha. The decline of this celebrated city, owing chiefly to the imbecile and dissolute character of the Iman of Senna, was marked by the absence of ships from its harbor; an American trader and two Egyptian men of war were all that were seen in the roads. The city itself was in the possession of a body of wild Bedouin Arabs, who had seized and sacked it some days before. The streets were a spectacle of desolation, most of the inhabitants having fled to the desert, and nothing being exposed for sale in the bazaars. The rude Arab chief, however, who had established himself as governor, received our countrymen very civilly.

Early on the 18th, the steamer resumed her voyage, and continued to propel against a constant gale till the evening of the 22d, when off Jeddah, though she could not enter

that harbor till next morning, in consequence of the dangerous coral reefs. The streets, markets, and numerous coffee houses of Jeddah were found full of troops,—the head-quarters of Ahmet Pacha, the generalissimo of the army of the Hedjaz, destined for the subjugation of southern Arabia, being then within a few miles of it. The soldiers were armed and disciplined in the French fashion; but were far inferior in every respect to Indian sipahis. There were eight or nine Italian officers with the army; and, strange to say, a St. Simonian Frenchman, who had penetrated into that distant country, with the double purpose of searching for the mere, and disseminating his doctrines. In this lately bigotted city our travellers overtook the Rev. Joseph Wolff, who preached fearlessly with the Bible in his hand, at one of the chief entrances, to a crowd of at least 200, composed chiefly of armed soldiers, who offered him no indignity. The European visitors were most courteously received by Suleiman Aga, the Governor; they walked without molestation through the Medina gate to inspect the tomb of Eve, and the cantonment of the troops; and no objection was made (except by some idle children, who threw a few stones at them,) to their re-entering by the Mecca gate at sunset, so as to witness the departure of the pilgrims, which Dr. B. describes as a most interesting spectacle. That day's caravan (for one leaves Jeddah every evening for Mecca) consisted of 200 or 300 camels, which carried the aged and infirm amongst the pilgrims, most of whom, however, strode boldly forward, barefooted and bareheaded. Amongst them were several Persian and Hindostan Mussulmans; and there were some, who, from their countenances, must have met at this spot from the confines of China and Tartary, and the west coast of Africa.

On the 25th the Hugh Lindsay proceeded on her voyage, and again encountered an almost continual tempest to Cosseir. The decks were constantly wet, and the paddle-boxes broken by the force of the sea, which was so heavy that her speed at one time was reduced to two or three miles an hour. Late on the evening of the 28th the land of Egypt was visible at a distance, and at four o'clock on the 1st of March, she anchored at Cosseir; from whence, after landing some passengers for Thebes, she again sailed on the 2d, and ran a distance of 260 miles over smooth water, in about thirty-nine hours. Early on the 3d she entered the Straits of Jubal, and dropped anchor on the morning of the 4th in Suez roads. The Hugh Lindsay had now completed her voyage; and though struggling for nearly 1000 miles amidst the dangers of the Red Sea, against a strong adverse gale and heavy waves, had run 3242 miles in 31½ days, including stoppages, which amounted to 6½. She is, however, described as a vessel unsuited for long passages; and, in addition to the extra weight of coals, was encumbered with two heavy engines of eighty-horse power to a tonnage of little more than 400.

Suez and Cosseir are miserable towns, composed chiefly of clay-built houses, and almost entirely dependent on the pilgrims who pass through them for Mecca. The Cavendish Bentinck, an English ship, having carried away 500 or 600 of these wanderers from the former, a few days before the steamer arrived, it looked particularly desolate. The streets of Cosseir, however, were full of well-dressed Mahomedans of all nations; and the number of vessels in its port showed it to be a place of considerable resort, though it can never be a populous

town, as it contains no water except what is sold in the bazaars, and which is brought from the banks of the Nile, 125 miles across the desert. At Suez, the water is so bitter as to be scarcely drinkable. On the 5th of March, the passengers disembarked from the steamer, and after taking a slight repast in a room which had been occupied by Bonaparte, about two o'clock commenced their journey across the Isthmus of Suez to Cairo, 75 miles, Capt. Wilson and two of the officers of the Hugh Lindsay having resolved to accompany them. The caravan consisted of twelve gentlemen mounted on dromedaries, attended by Arab guides, and followed by thirty or forty camels, carrying the water, baggage, tents, and requisite supplies. This journey was accomplished in four days, and was attended with few of the usual discomforts, as the party had furnished themselves with most of the comforts and even luxuries of life, in respect to provisions. One had brought London soups and Scotch salmon; another produced a ham and tongues; a third, French bouille, champagne, claret, &c. Fowls, mutton, and bread, were in profusion; and, in fact, there was abundance of every thing except water, which some of the party had neglected to bring in bottles from Bombay, and a quart of which was considered more valuable than wine before the journey was over. On the 8th, they met the poor Dey of Algiers, who, with his harem and attendants, was proceeding to Mecca; and by one o'clock they entered one of the stupendous Saracen gates of Cairo, having, in the course of a short half hour, made a transition from a silent wilderness into the heart of a mighty metropolis, swarming with human beings, and filled with interesting objects.

They remained at Cairo five days, inspecting the curiosities in the city and its neighborhood, and were presented to the Pasha, who, though the war in Yemen appeared to be his favorite topic, declared his intention of making a railroad across the Isthmus of Suez, for which purpose English engineers are already engaged in surveys. On the 13th, Dr. Burnes and some of the party embarked at Boulac, on the Nile, entered the Melmoudieh canal, and arrived at Alexandria, which on the 20th he left, with the Rev. Mr. Wolff, for Malta, where they arrived on the 4th April, and were shut up in the Lazaretto for twenty days.

*Proposed Line of Communication between N. York and N. Orleans, via Savannah, &c.*

To the Editor of the Railroad Journal:

SIR,—I enclose you a Report of a meeting held in Savannah, on the 15th inst., on the subject of the contemplated communication between this city and New-Orleans, via Isthmus of Florida. You may deem it worthy of re-publication in your valuable Journal.

Very truly, &c.

R. P.

Savannah, January 28, 1835.

**ATLANTIC AND NEW-ORLEANS SEABOARD LINE COMPANY.**—At a meeting of merchants and other citizens, favorable to the establishment of a line of communication between New-York and New-Orleans, by the way of Savannah, Florida, &c. held at the City Hotel on the evening of the 15th inst., Joseph Cumming, Esq. was called to the chair, and Wm. Robertson appointed secretary.

The Chairman having briefly explained the object of the meeting, it was addressed by Mr. R. King, who detailed the immense advantages to be derived should the project

\* The Montrose Review.

† See p. 146, As. Intell., &c.

be carried into effect, supported by estimates of the cost, income, &c.; after which, the secretary having read the Charter of the Atlantic and New-Orleans Seaboard Line Company, granted by the Legislature of Georgia, the following resolutions offered by Mr. King, and advocated by the Chairman, and other gentlemen present, were unanimously passed.

Resolved, That this meeting considers the

company; and that R. F. Williams, G. W. Anderson, Peter Mitchell, B. Burroughs, M. H. McAllister, G. Shick, and Geo. Hall, be a committee to assist the commissioners under the charter, in having the said stock subscribed on the first day of the opening of books.

The foregoing proceedings were then ordered to be published in the gazettes of this city, and the meeting adjourned.

JOSEPH CUNNING, Chairman.

WM. ROSSIGNON, Secretary.

Washington City, Aug. 12, 1834.

To the Editor of the Railroad Journal:

Sir,—In your Railroad Journal of the 9th instant, you speak of a plan in contemplation for improving the travelling route from Savannah, Georgia, to Mobile and New-Orleans. This plan proposes to employ steam-boats from Savannah, along the coast to St. John's, then up that river to

Mr. King's estimate of proposed route from New-York to New-Orleans, via Savannah, in eight or nine days:

	Estimate of Cost.
2 New-York steamboats	\$100,000
2 Savannah do.	50,000
2 New-Orleans do.	70,000
10 Stages and Harness.	5,000
150 Horses.	15,000
Opening roads.	10,000
Capital required,	\$250,000

	Supposed Weekly Expenses.
2 New-York boats, each	\$1,250
2 Savannah do.	625
2 New-Orleans do.	1,250
10 Stages, drivers, and keeping 150 horses.	500
Extra expenses.	2,000
	\$6,750

	Supposed Weekly Receipts.
Estimated on a travel of 3000 passengers annually to, and same number from, (in this estimate no allowance is made for way passengers, or carrying the Mail.)	
Average 75 passengers on and 75 from—150.	\$11,250
Deduct weekly expenses.	6,750

Clear gain per week.	\$2,500
Annual gain—\$130,000.	

Black Creek, one of its branches. This latter, it is supposed, has sufficient depth of water for steam-boats for 25 or 30 miles. From the highest point navigable, a road is to be constructed in a line across the Isthmus to the Santafee river; the line then takes down this to the Suwanne, into which it empties—from hence the proposed route to the Gulf is not clearly designated. The Suwanne is no doubt navigable for common steamboats, the greater part of its length from the Santafee to the Gulf, but it becomes more difficult as the Gulf is approached; has no harbor at its mouth, and only three or three and a half feet of water on the bar fronting the estuary; this and for near one hundred miles towards Mobile, there is no harbor into which an ordinary sized coasting vessel could enter and find shelter from the frequent storms of the coast of the gulf. At St. Mark's only could a harbor be formed. This route then may be considered as impracticable.

The line proposed by that eminent engineer, General Bernard, for the canal, after it had reached the Suwanne, and approached within 40 or 60 miles of the Gulf, was to strike off westwardly to St. Mark's, and run nearly parallel with the coast, distance about 70 or 90 miles. If this line is selected for the new road, it will add so much to the land travelling as to make the whole distance not less than about 120 miles, instead of 41, as conjectured by your correspondent.

There are other difficulties opposing the scheme suggested in your paper, which do not appear to have been known to its author. The navigation from the Savannah to St. John's is far from being safe or easy. The entrance into the St. John's, from the Atlantic especially, is regarded as dangerous and uncertain, and no safe shelter for the vessels which enter it for many miles above its mouth.

The author of the above short remarks has been induced to present them to the public with a view to invite more particular inquiry into a subject in which it is deeply interested. A reference to the report made by General Bernard in 1829, and published by order of Congress, would afford much useful information in relation to it. He was employed many months in making the survey, and the accuracy of the results may be confidently relied on. It may be added, that if it was practicable to pass down the Savannah into the Gulf, the difficulties of farther navigation would be almost insurmountable. Mobile is not less than 500 miles west of the mouth of the Savannah, and there is no way to reach it but by direct navigation through the Gulf, the coast, at least for 200 miles, is so shallow that no vessel can approach within many miles of it in all that distance.

Very respectfully, &c.  
CIVIS.

[For the American Railroad Journal.]

Steamboat and Stage Route along the Atlantic, and Gulf Coast, connecting the Principal Commercial Depots, from Charleston to New-Orleans.

From Charleston to the St. John's river, in Florida, there is an inland passage for steamboats drawing not more than 5 ft. water, and approaching the ports of Beaufort, S. C., and those of Savannah, Darien, and St. Mary's, in Georgia, at such convenient distances, that they may be made touching points on the route.

From Charleston to Beaufort,	45 miles.
Beaufort " Savannah,	30 do.
Savannah " Darien,	65 do.
Darien " St. Mary's,	60 do.
St. Mary's " the junction of inland passage with St. John's river,	30 do.

200

The St. John's river is navigable for steamboats of the largest class to Lake George, and to the forks of Black creek, one of its tributaries which approaches nearest to the waters of the Gulf of Mexico.

From the north of inland passage, on the St. John's to Jacksonville, the county seat for Duval,	30 miles.
From Jacksonville to the mouth of Black creek,	20 do.
From Black creek to its forks,	15 do.

55 miles.

From this point to a navigable point on the Santa Fee, a tributary of the Suwanne river, over a high dry ridge, susceptible of a good road, would not, on a straight line, exceed 50 miles. By the present route (somewhat circuitous) travelled, it is 60 miles.

The Santa Fee is not at this time navigable, owing to decayed and falling timber which have obstructed occasionally the passage; General Bernard reported, however, that they were easily removed.

The distance from a navigable point to the Suwanne,	20 do.
From the mouth of the Santa Fee to the mouth of the Suwanne river,	20 do. ?

The Suwanne is obstructed near its mouth by banks of oyster shells, over which not more than 4, or 5 feet of water can be carried. From the mouth of Suwanne to the St. Marks, the coast is a low, flat, marshy shore; no beach, and no breakings of the sea. An outer reef of rocks, &c. protects this part of the coast from the heavings of the ocean, and renders this passage between perfectly safe for steamboats of the smallest class, or least draft of water; barges, and even common flats, have navigated this passage without injury.

From Suwanne to St. Marks,	70 do.
Up the river to the Devil's Elbow, four miles; from thence to St. Mark's town, four,	8 do.
From St. Marks to the mouth of the Apalachicola river,	55 do. *
There is an inland passage through St. George's Sound for the greater part of this distance.	

223 mls.

After describing the present route of travelling from the Appalachicola to Mobile, our informant proceeds thus—

Should it be deemed however more advisable to continue the steamboat route without these land interruptions, a sea steamboat might pass from the mouth of the Appalachicola to Mobile Bay, touching at Pensacola, and unite with the Orleans steamboats at their landing-place, on the rear of Mobile, and opposite Dauphine Island.

The same stages which meet at that

point from Mobile could convey the passengers in either direction. By this route there would be no continuous inland passage, though very fine bays, such as St. Joseph's, St. Andrew's, and Santa Rosa, would afford safe harbors of refuge in case of storms.

Distance from Appalachicola to Pensacola,	140 miles.
Thence to St. Joseph's Bay, 30 miles.	
St. Andrew's, 25 do.	
Santa Rosa, or Choralawhatchie Bay, 50 do.	
Pensacola, through the Santa Rosa Sound, 35.	
From Pensacola to Mobile Bay, 40	
Mobile Bay to point of junction with Orleans steam boats,	25
	205 miles.

In the last distance the boats would have to pass through Pass Heron, a passage between Dauphin Island and the Main, which I do not think is at this time practicable for steam-boats drawing more than three feet water. It is susceptible, however, of improvement, and an appropriation to that effect by Congress was very advantageously expended the last year, but was inadequate to the accomplishment of the object contemplated. The report of the engineer was favorable, however, and there can be no doubt of an additional sum being granted, provided the object of opening the navigation of that pass should become so important, as it would, in connexion with the steam-boat route now in agitation.

WHOLE DISTANCE.	
From Charleston to St. John's, (water,) . . . . .	230 miles.
St. John's to forks of Black Creek, (water,) . . . . .	55
From forks of Black Creek, over-land, to Santa Fee, (land,) . . . . .	50
Santa Fee to mouth Suwanne river . . . . .	40
Suwanne to St. Mark's, (sea coast,) . . . . .	70
To St. Mark's . . . . .	8
Appalachicola . . . . .	55
Pensacola . . . . .	140
Junction with Orleans steam boats . . . . .	65
Total distance, land 50; water, . . . . .	663
Distance from the point of junction with Orleans boats . . . . .	200
Land . . . . .	50
	913 miles.

## EXTRACTS FROM

*An Act to incorporate the Atlantic and New-Orleans Seaboard Line Company.*

Whereas, Joseph Cumming, S. B. Parkman, Geo. Hall, Robert Habersham, Ralph King, Wm. Duncan, and others, have, by their petition, represented that with a view to establish a shorter, more safe, and expeditious route from the Atlantic Seaboard to New-Orleans than the one around the cape of Florida, they have formed themselves into an Association, under the name and style of the Atlantic and New-Orleans Seaboard Line Company, and in order to insure and establish their said association in a permanent and effectual manner, so that the attainment of their object may be more facilitated, have prayed the Legislature to grant them an Act of Incorporation. Be it therefore enacted by the Senate and House of Representatives of the State of

Georgia in General Assembly met, and it is hereby enacted by the authority of the same, That the said Joseph Cumming, S. B. Parkman, Ralph King, Wm. Duncan, and their associates, be, and they are hereby declared a body corporate, by the name and style of the Atlantic and New-Orleans Seaboard Line Company, and by the said name shall have perpetual succession of officers, and members, with power, by their said corporate name, to sue and to be sued, plead and be impleaded, and of using all necessary and lawful means for recovering or defending any property, debts, demands, which they may have or claim in behalf of said Company, to hold real and personal estate, and have and use a common seal, and the same, at pleasure, to alter or change, and with power to make, alter, change, and amend, such by-laws as may be necessary, and agreed upon by the said Company.

Sec. 2. Be it further enacted by the authority aforesaid, That the capital stock of said company shall be the sum of two hundred and fifty thousand dollars, to be divided into shares of five hundred dollars each, with liberty to increase the said capital stock to one million of dollars.

THE SUWANNE.—A new entrance has been discovered to this river. We have seen the gentleman who made the survey. The harbor is behind the Cedar Keys, about ten miles to the southward of the Western Pass. This passage is narrow, but it is not difficult to enter, and will admit vessels 12 or 14 feet draught. From this point there is a channel behind the island, eight or nine feet deep, sufficient for steamboats of any burthen. Opposite to the harbor, on the main land, there is a high bluff shore, affording an eligible site for a town. There is much good land in the immediate vicinity, and on the upper branches of the Suwanne, which extends nearly three hundred miles into the country. To the South, there is an inland channel extending along the coast to the mouth of the Amaxura, a river which has much good land on its shores, but no harbor at its mouth. This will add to the value of the discovery. It was unfortunate that the engineer who formerly made the survey was not attended by a competent pilot. His failure to make any useful discovery at this point, we do not consider detracts anything from his merits as an engineer.—[Tallahassee Floridian.]

[From the London Mechanics' Magazine.]

## The Claims of Mathematical Science.

SIR,—I much regret that, in honoring your pages and myself with some remarks on my recent article on mathematics and the mathematicians, Mr. Exley did not extend his observations to a greater length, for he is well entitled, because he is well qualified, both as a mathematician and a philosopher, both as a man of universal information, of varied learning, and of powerful ratiocination, to pronounce an opinion on the subject in discussion, deserving the most respectful attention. I am the more bound not to withhold a proper tribute to his merits, because I have already taken, and may have further occasion to take, exception in some degree to his theory of physics, and in the present paper intend to offer some strictures in opposition to his remarks. Not that I would deprecate, or admit the necessity of deprecating offence: for so long as ob-

servations are offered in the love of truth, and uncontaminated with that uncanonized and captious spirit which controversialists, (even among your correspondents,) are too apt to evince, I am fully assured they will be received with "that stronger attachment to truth, than to any erroneous system," which he professes to entertain.

I fear, from his too short but pithy remarks, he has imbibed the impression, that I have labored to decry mathematical science, though my observations, he will observe, are on its comparative value and importance. Nay, it is quite in accordance with my views, that even "the mere mathematician is not to be set aside;" for, almost at the very outset, I stated that this class of men "are, doubtless, valuable members of the body scientific, but that some among them (the least generally informed) are sadly inclined to over-estimate the honor of their station, and the comparative value and importance of their labors." Apart, therefore, from and besides its obvious misuses, there is surely sufficient ground for animadversion in the fact, that the excessive reverence for this science, (be it usurped or freely bestowed,) which so much prevails, facilitates with a baneful influence on the best interests of philosophy, a too favorable reception for every thing, however crude, which is presented to us clothed in its forms. It certainly is within the verge of useful discussion to consider, whether the primitive and long acknowledged claims of this science to just respect have not in our day bribed, and even forced our reason, by its inordinate but imposing pretensions, to a false, because extravagant, estimate of its value and importance. It is true, as Mr. Exley says, "that no one will plead for the misuse or misapplication of the science;" but then there are many who will debate what is or is not deserving of that reproach, and, in the general prostration of the mind to mathematical genius, the danger is that we may esteem as legitimate what may prove to be of spurious birth.

In the rapid march of knowledge—the knowledge of nature,—the general mind has been strengthened and freed, in some measure, from this prejudice; but the time was when it was thought no misapplication of mathematical science to apply it to human physiology—when even the fanciful hypothesis of celestial vortices was thought to be illustrated and particularized in man's bodily frame; and the time may be, when applications now accepted may be thought to be a misuse.

When the mathematics was the only science of which mankind had to boast, it was naturally regarded with unbounded veneration. When the vain philosophy of the schools was discarded, it presented fresh claims for admiration and regard. The feeling has descended to our times, though the circumstances which justified it have passed away. Philosophy has entered, and is daily entering, on other domains than those of quantity; and that science is now but auxiliary, and

only occasionally, to more enlarged, and, let me add, more highly intellectual pursuits. Yet an antiquated and almost exclusive admiration still clings, though with a faltering hold, to the public mind, equalled only by one other prejudice—the reverential respect which is yet awarded to classical learning: these have been respectively fostered by the two Universities, once truly the lights of a by-gone age, but which are now visible only in the pervading darkness of their own precincts.

High mathematical knowledge is not to be turned to account in the ordinary walks of life. Besides, even where the sphere of its exercise is not wanting, other higher and rarer endowments of the mind—those which constitute the philosopher—are requisite to enable its possessor to bring it discreetly and powerfully into operation. Is it not infatuation, then, to allow the mere power over an instrument of knowledge to usurp the place in our estimation which should be assigned to its adroit and skilful use in its wise and efficient applications to appropriate and useful objects? And is it any thing better than infatuation, when we hear it said of any one that he is a great mathematician, if he be nothing better than this, to look up to him as being qualified, in virtue thereof, to take the lead in the ways of knowledge, and to ascribe to him pre-eminent intellectual powers? Some mathematicians will not countenance this delusion. It was said of one of the celebrated French analysts, that he expressed his surprise at finding the study of chemistry to be not more difficult than that of the mathematics; and a distinguished living mathematician is accustomed to say of any thing of little difficulty, that "it is as easy as algebra:" an expression which will find a readier acquiescence; but still it shows, that in this gentleman's opinion, this kind of study is not very arduous.

I have just adverted to the two branches of learning which separately distinguishes each University, and which, if not pursued to the entire exclusion of other studies, characterises and gives celebrity to those places respectively, and to which honors more particularly appertain.

Mathematical knowledge and classical literature, it is readily admitted, are of great value, and it would manifest unusual stolidity to deny it.\* It is even proper when peculiar aptitude ensures success, that for the purpose of attaining high excellence some should devote their attention almost exclusively to their study; but in regard to persons in general, among whom it would be folly to expect that Parris and Eulers may abound, and

\* Why should Mr. Frend continue to impute such nonsense to me, by stating my explanations on this point to be unsatisfactory? Is it impossible, then, to a mathematician to take any other than extreme views of a subject, unmodified by influential considerations? or to entertain any other than *ultra* and abstract opinions? To such a course his mind is certainly biased by his studies; and does not Mr. Frend himself furnish a case in point? To persons of this cast, any thing like discrimination carries the appearance of inconsistency or contradiction.

not desirable that they should, it is contended that too much useful time, yea, too many of the world's interests, have been sacrificed to the pursuit of these attainments, which unavailing and unproductive, probably, in their end, have been stimulated only by a false opinion of their all-engrossing importance. The fault consists in allowing brilliant instances of particular and perhaps professional attainments, to seduce our judgment into a magnified estimate of their value, or into a diminished opinion of general acquirements being essential to a liberal education, but which general knowledge, after all, may in many cases be highly conducive to success in the more favored pursuit, and must in most cases be absolutely necessary, in order to render that pursuit, in its application, beneficial to society. Ardent youth is naturally impelled to tread, though with humble steps, the path which men of distinguished talents have irradiated with the halo of their glory. Fired with enthusiasm, all his energies are engaged to follow up the chosen track; he becomes insensible to every thing besides; he is deaf to the voice of wisdom; he responds not to her calls to explore the other avenues of knowledge, but contemptuously regarding them as by-paths, insignificant and obscure, he pushes on, till at last he falters, and finally he falls short of the high object of his aims; meantime he has lost the goodly prospects which awaited him on every hand, he has enjoyed only a few contracted views, he has had some partial glimpses, and which, to his purblind vision, have appeared to be all that was worth a thought in nature's wide expanse, showing that those illustrious men who, not improperly, have been called the lights of the world, may, under some circumstances, truly prove to be lights, also, which "lead to bewilder, and dazzle to blind." Admit that the aspirants to honor and distinction have succeeded to the very stretch of their ambition, and what do we have as the most favorable result, but men of one idea, men of an exclusive theme, men admirably suited to become the professors of their peculiar learning, but who, in the ordinary affairs of life—yea, in the ordinary walks of knowledge,—manifest a simplicity, not to say an imbecility, which makes even the illiterate smile. Their vocation may be honorable, and the sphere of their duties useful; but still it is the sphere of a class of individuals, and for that reason they ought not to be considered as being the exemplars of the course of study befitting the community of the learned. Besides, though well qualified to be instructors, would they be less, or rather, would they not be much better adapted for that office, if they had taken a more varied and extended survey of things? Would they not enlighten, and more intensely interest us, with illustrations and analogies gathered together out of all the territories of knowledge? Would not their observations be more marked with wisdom, their positions advanced with greater discrimination, and their

principles receive that salutary modifying and moderating correction, which enlarged and liberal views fail not to enforce? And, as members of society, would they not be less exacting and less monopolizing of claims to paramount consequence for themselves and their pursuits? Would they not be more moderate, more accommodating, and more distinguished for amenity in general intercourse, and in the transactions of general affairs? In the multifarious concerns of busy life they are manifestly incapable of taking a judicious part. The ruling spirit of their theme mars all their perceptions, sways all their opinions, gives a tinge to all their thoughts, and particularly spoils the faculty of taking a correct estimate of things, for they always refer to their own pursuit as the standard by which they judge of the value of others. The observations contained in this paragraph have been suggested, and may have been illustrated, by some passing events of the day, which it would be indecorous to specify, but the parallel of which most persons will be able to furnish for themselves. I have also to apologise to Mr. Exley for introducing them in this correspondence, for nothing relating thereto, or to him,\* has called them forth. They are also becoming too general, for they apply to other subjects besides the mathematics; let us, therefore, return to that which is more immediately before us.

Mathematical knowledge was the first acquirement of man, as it is of men. This is, as Mr. Exley properly remarks, the order of nature; but it is significant also of the simple and elementary nature of the procedure of the understanding by which it is disciplined to its attainment, and it was for the purpose of showing this that the quotation from Blakey's logic was introduced. That it is not more general—that so many "neglect or reject their birthright," as Mr. Exley considers it to be—must not be attributed then to the strong intellect possessed only by a few, which is requisite for its acquirement, but to the repulsive manner, probably, in addition to its not being in itself very attractive, in which it is first presented to our notice. The point which I wished to establish, and to which the testimony of Mr. Exley is the more valuable, because he is peculiarly competent to give it, is the fact, that the mathematics is quite within the reach of ordinary talent. Though I admit, with Mr. Exley, "that mathematics is the first science in the order of nature," it does not follow that I ought also to admit that it is pre-eminent in honor and utility, which it was the drift of my observations

\* I remember, however, that a paper from Mr. Exley, read before the Royal Society, met with very cavalier treatment, in one quarter, merely, it would seem, because it did not chime in with particular individual pursuits; and we all know what intestine broils existed in that learned body, for want of, not to say mutual assistance, but even mutual toleration, among the respective partisans of the several branches of science, and which, as having occurred many years since, may now be properly adverted to as examples for warning and instruction. Let us hope that the British Association for the Promotion of Science will introduce a new era of harmony and co-operation.

to disprove; for mere priority confers no particular value, else would common arithmetic have pre-eminence over the mathematics itself, to which it is the first or elementary step.

Mr. Exley asks, "Why should mathematics be set in opposition to practice? Had Priestly, Franklin, and all practical men, the inventors of steam-engines, and others, been great mathematicians, could this have made them less practical, or less successful in their practice? Who was more practical than Newton? His optics present a model for all practical men." I would say, in reply, that, in all probability, if these men had been great mathematicians they would not have been what they were—the benefactors of mankind; and in proof of this, I refer to what is indisputable, that the great mathematicians have not been practical men, and that the most eminent and successful men in practice have not been mathematicians. It is a curious fact in psychology, which I have in my previous paper endeavored to explain, that these separate pursuits do not proceed together with an even flow, but that one occupies the mind almost to the entire exclusion of the other. Of course there are exceptions, else would the proposition be not the enunciation of a general fact, but a mere truism. Newton was an illustrious exception, and I had myself referred to him as such. He was more than possessed of practical views; he was an operating experimentalist, and a very ingenious one too, and a clever operative mechanic to boot. May I be permitted to say, that these remarks have been occasioned by one who is also an exception, and therefore it is that those pursuits do not appear to him to be discordant. It is true, as he intimates, that they are not "to be set in opposition," if by that he means irreconcilable opposition to each other, but rather in juxtaposition, by the way of foils and antithesis; but though there is no necessity in the nature of things, there is great probability in the reason of things, that great attainments on either hand should mutually disqualify the mind for the opposite pursuit, and every probability in the course of things that they should incapacitate it—the one for the reception of the other. This view of the subject may appear to some to be better corroborated, by using the converse expression of the fact before stated, that those who have made equal attainments in both pursuits have commonly not been eminent in either. It will be admitted, however, that there have existed an illustrious few, to whom opportunities have not been denied for the exercise of abilities equally rare. The late Dr. Thomas Young was eminently distinguished for practical views; they pervaded and characterised all his studies, and gave a peculiar tone to those which were the most abstract; though, like the gentleman on whose remarks I am now commenting, uncontrollable circumstances may have confined his aims, more than others, to the closet rather than

to the laboratory. If, however, these pursuits, so distinct in themselves, are more commonly pursued apart—a course, be it remembered, which is not recommended—it is surely very properly open to discussion, without setting them injuriously "in opposition to each other," whether the one or the other is the more arduous, the more useful, the more honorable, or the more intellectual. Without pretending to decide in a case where personal predilections will turn the scale, it is enough for me to put in at least an equal claim to these distinctions in favor of practical pursuits, as including those which are observational, inductive, and experimental; or to bar the speculative one, at any rate, from carrying off all the honors—a triumph which it has been too much the custom to concede to it. I have advanced these claims to estimation not particularly on the ground of utility, which is surely undeniable; for geometry of the highest order, and the science of quantity generally, and as applied to the motions of the heavenly bodies in particular, flourished for ages on the Ganges, without any beneficial influence on the interests of mankind, and was reported into, or revived in Greece, without superseding, or even correcting, the Stagirite's logic and philosophy; but I have advanced them more especially on the bolder and less usual plea, of at least equal if not superior intellectual powers, and as much patient and laborious perseverance being required in those pursuits which trace the connection of things, as in that which establishes the connection of ideas—in those pursuits which unravel to the core, as in that where we have the naked essence already formed to our hand—in those pursuits which take the subject matter to disembarass it of its extraneous envelopment of circumstances, as in that where we can conceive of it at will abstractedly, and work with it as such wherewithal—in those pursuits, I say, where, having arrived by an extensive analysis at the elements or principles which are the objects of our research, we have to embrace, in their natural order and degree, the whole circle of combining influences, however diverse in their nature, ere we can erect a philosophic system, or advance a true explanation of phenomena or events, as in that where the materials of a simple though imposing superstructure being called into existence at our bidding, and impressed with qualities at our pleasure, are of one and the same nature, of restricted and homogeneous influence, devoid of interfering and collateral action, and only require for their regular collocation an unembarrassed unilateral proceeding. Besides the reasons now incidentally alluded to, as subsisting in the inherent differences between the separate subjects, I may adduce in proof of my position the indisputable fact, that the speculative science advanced by extensive strides, and was brought to a comparative perfection at a very early period from its foundation; whereas the practical sciences approached to maturity only

by slow degrees, and are yet in progress, showing that the difficulty in one case is of a character to be easily and quickly surmounted, and in the other that it is more formidably intrenched. Again, those rapid advances were made comparatively by a few individuals, and though it seems paradoxical, it is not the less true, it was precisely because the laborers were few, that those advances were rapid, extensive, and broadly seen; for if the nature of a work be so toilsome and different as to require a great number to engage in it, the steps of its progress, though innumerable, must necessarily be minute and scarcely perceptible. The speculative science, therefore, must come more naturally and easily within the compass of our faculties, since a few has sufficed to cope with it, and reduce it to order. The paucity of laborers sufficient to produce great effects, argues also that this science does not demand much more than ordinary talents, since the chance of finding those which are extraordinary is in such case greatly lessened. I cannot, however, go so far as to say with Mr. Exley, "we need not wonder, then, that all men are born mathematicians, though many neglect or reject their birthright." This would be to humble their pretensions, more than any one, besides a mathematician, dares to do.

In my next communication I intend to notice those observations of Mr. Exley which refer to his own theory of physics, and to take a slight review of it.

I am, sir, yours, &c.

BENJAMIN CHEVERTON.

October 20, 1834.

P. S.—Mr. Frend has very unnecessarily occupied your pages in quoting various testimonials in favor of Euler and the Bernoullis, for, unquestionably, they were illustrious mathematicians, and I stated as much. As to the *tractory* curves, which he thinks are improperly named, I can only say they were so called by Euler himself, though they defied even his skill to render them *tractable*. The witicism that Mr. Frend sounds on this poor equivocation, is about as smart as his invitation to me to give the equations of a few of these "*strange curves*," in which attempt even Euler failed. He further allows himself to say, that certain highly useful *experimental* researches, which he enumerates, "are of course, according to the Chevertonian philosophy, mere matters of moonshine." I would respectfully inquire of Mr. Frend, why he thinks it necessary to resort to misrepresentation, and why the calm face of philosophic discussion should be disfigured with the ebullitions of temper? Those who honored my paper with a perusal, will not be induced by any one to believe that its purport was not precisely to establish the superiority of practical and experimental pursuits over those which are speculative. Mr. Frend has discovered an omission in my enumeration of Kepler's laws, which he contends were three. He is perfectly at liberty to consider it to be a law of planetary motion, that the orbits of the planets are ellipses,

though, according to my notions of phraseology, it ought rather to be called a fact in the planetary system. It is not unusual to speak in the dual number of these laws; but it is even more common, perhaps, to use the singular number, and say, Kepler's law. As a foreigner, sensitively jealous of the fair fame of foreigners, it may be allowed to him to be a little captious.

**DR LARDNER'S,  
Second Lecture on Steam.**

*Delivered before the Liverpool Mechanics' Institution.*

The celebrated Leslie has invented a method of producing ice, by the employment of sulphuric acid. This acid has such a strong affinity for water, that if it is presented in an atmosphere filled with vapor, it will immediately arise upon the vapor and incorporate it with itself. He places water in a watch glass under the air pump, with sulphuric acid near it: the air being withdrawn from the pump, the sulphuric acid seizes upon the vapor as it rises from the water, and the water, parting with all its heat to maintain the vapor, is converted into ice. In performing this experiment, it is necessary that the vessel containing the sulphuric acid should not be in contact with the water, otherwise the degree of heat which accompanies the combination of the vapor and the sulphuric acid would prevent congelation taking place.

A very pretty experiment, to prove that the atmospheric pressure is a great agent in preventing water from boiling, can be performed with a flask half filled with boiling water, and closed at the neck. If it is in that state plunged into cold water, it will boil: but the ebullition will cease when plunged in boiling water. This is because the cold water condenses the steam in the upper part of the flask, and, by removing the pressure, allows the water to boil; whilst the hot water keeps up the temperature of the steam, which presses on the surface of the water so as to prevent its boiling.

From these investigations it may be concluded, that a liquid or gaseous state is not essential to the nature of any substance, but that its state is entirely dependent on the supply of heat which that substance has access to. We know that water can be passed through these three states, by the abstraction or the application of heat.—Fluid mercury may be evaporated, and the fact ascertained by passing the vapor through a cold tube, and it will again assume a liquid state: it may also be made solid, so as to take a shape like a metal. The most refractory substances we know of are capable of being converted into liquids by heat. All the metals we know of may be brought into a state of fusion by a proper supply of heat: indeed, all substances, by proper treatment, may be seen in the solid, fluid, and solid state. By turning the rays of the sun, through a lens, upon gold and platinum, we can decompose them, and convert them into gas.—There is only one solid which has not yielded to fusion, and that is carbon, or the diamond; but we can only conceive, that we cannot reduce it, because we cannot command a sufficient quantity of heat to melt it and maintain it in a liquid state. Of all liquids there is only one which has been congealed by the abstraction of heat, and that is alcohol, or spirits of wine.

We can only argue by analogy, that the bodies which exist in the gaseous state can be reduced to liquids or solids; Which leads us to suppose, that the substances known as atmospheric air, oxygen, hydrogen, &c. are, in fact, nothing but the steam of various substances which cannot exist in the liquid state upon the surface of our globe without being deprived of a large portion of heat. This analogy has been confirmed by recent experiments and discoveries, particularly by those of our distinguished countryman Faraday. Neither steam nor any gas can be reduced to a liquid by compression alone, however high the degree of compression applied to it, notwithstanding the assertions of superficial writers, and even of some who are otherwise

well informed, on the subject. But if, by the compression we could squeeze out the heat from the gaseous bodies, we could then liquefy them. Dr. Faraday has substantiated this by actually converting several gases into liquid. For instance: he found, that when carbonic acid gas was submitted to a pressure of 1000 lbs. on the square inch, it became a liquid. It must, however be remarked, that as the pressure is increased the temperature is raised; and it is not until the gas is cooled that liquid is produced. These facts, united with the other analogy afford such a high degree of probability, that, to a reflecting mind, there can be no doubt that every substance in parting with its heat to a certain extent, becomes a solid: and it is possible to conceive, that if, by any circumstances, the temperature of our globe were raised sufficiently, the water of the ocean would no longer be able to exist in a liquid form, but would assume the state of vapor, and mix with the atmospheric air. By the same cause, many of the solids would be converted into liquids, and fill the body of the ocean, so that we should have an atmosphere of steam, and an ocean of metal.—a gold and a silver sea. Then, again, by the process of evaporation, which causes liquids to pass into vapors, we should see the fable of Jupiter descending in a golden shower illustrated in golden and silvery showers. To carry the analogy still further; we know that water cannot exist in a liquid state at the poles. A slight decrease in the temperature of the globe, or a change of distance of the sun, would cause all the water of the earth to become solid: a further decrease would freeze the various gases, so that the air would drop down, and form an ocean of water: and a still further reduction of temperature would convert it into a solid body. These circumstances suggest to a reflecting mind the beautiful adaptation of the different objects on the globe to each other, and to the distance of the earth from the sun. Otherwise, those substances which ought to be liquid, for the sustenance of animals, would subsist in the solid state. It is not at all improbable, that the different planets have different substances in them, suitable to their distances from the sun: for there is no doubt that the temperature is produced by the sun, and depends on the sun's distance from the planets, and its intensity is diminished in proportion to its distance. In the planet Jupiter, the heat is twenty-five times less than it is with us; and water, on such a globe, could not exist in a liquid state, unless heat was supplied from other causes than the sun.

When we consider the prodigious mechanical power which has been obtained, by the mere ability, on our part, to convert a liquor or water into steam, and reconvert that steam into water; when we consider the enormous amount of human civilization which has been produced by the due application of this simple physical effect; when we consider, that it is probable that the relations of the human race may be altered and modified by this application, and the very distances of the different parts of the world be changed by a speedy intercourse, and the prices of the objects of consumption be ultimately affected by it: when all these effects are attained by the mere fact of our availing ourselves of the simple physical effect of converting water into vapour and back again, we naturally say, where there is so large a field, and so many different substances from which the effect may be produced, should we not expect, from the large advances which are making in the generalization of these principles, that this effect may be produced from other substances. Water possesses several properties which render it the most hopeless and unfit for such an experiment. In order to convert it into vapour we, of course, apply heat. The least promising liquid is that which requires the largest application of heat; and, of all liquors, water consumes the largest quantity of heat, requiring 1,000 deges. to raise it from a boiling state to a state of vapour: therefore, *a priori*, a philosopher would say, try spirits of wine or a thousand other things, but do not try water, for this special reason. It may be said, that the cost and difficulty of producing any species of vapour does not depend upon the fuel necessary to produce it, but on the cost of the liquid itself. Supposing, then, we could get fuel for nothing, still water is the most unfit and unpromising agent.—

For instance: in the transport at sea, the source of heat is derived from coals, which are bulky, and are transported in the vessel in order to produce steam: the water at sea costs nothing; and, suppose the fuel costs nothing, still they must be carried, and they impose a limit to the application of the steam engine to the purposes of navigation. A vessel impelled by steam power of 200 horse, consumes one ton of coals per hour, or twenty five tons per day: therefore, to provide for a voyage of twelve days, it would have to carry with it twelve times twenty-five tons of coals.—Thus, therefore, there is a limit to the application of steam navigation. It is generally understood, that a vessel cannot carry more fuel than is necessary for the purpose of propelling it ten or eleven days; consequently, by the present steam impelling power, such a voyage as from Liverpool to New York could not be made for any practical and advantageous purposes.

In considering the prospects of improvement in these respects, we naturally look towards those liquids which are most readily turned into a gaseous form. Ether and alcohol are easily converted into vapor, but in the way in which the steam-power has been applied these liquids are rather expensive. If it was used in a high-pressure engine, the vapor would escape into the air and be lost; whilst, in a condensing engine, although not lost, it would be mixed with so much water that its separation would be attended with considerable expense. There is only one other way in which it is possible to use alcohol, namely, by condensation, in contact with a cold surface. If we introduce the vapor of spirits of wine into a thin shell, formed by two bodies placed one upon another, after working the engine, it will spread over the cold surface of the hollow shell, the steam will be reconverted into a liquid state, and trickle out at the bottom, so as to be warmed over again, and this might be carried on from time to time.

But this great step must be followed by another improvement in the steam-engine, especially for the purposes of transport both by land and by water, which will doubtless be cultivated in our own time. It is the application of the gases, and especially of carbonic acid gas, in a liquid form. If we could obtain carbonic acid in sufficient quantity, and on sufficiently moderate terms, there is no reason why it should not be employed to supersede steam at the present time. This gas takes the liquid form at the common temperature, under a pressure of 1,000 lbs., and in that state exerts a prodigious power, and from its small bulk, would effect a saving of tonnage. The difficulty to its adoption lies in the price of the liquid, the providing of proper air-tight valves and pistons, and in guarding against the corrosion which the carbonic acid would cause in the materials themselves. But all these are matters of detail, and are at present but temporarily difficult, and we may, therefore, look forward to the superseding of coals altogether in the steam engine, by the use of the liquid carbonic acid, as nothing would be necessary except to send it into the receiver, and let the piston of the engine work as with steam; possibly it might be found expedient to apply heat, but a trifling degree only could be applied, as the power of the gas is so great that it has no bounds. Thus we should get rid of the magnitude of the marine boiler, and a thousand other inconveniences which attend it. We may, therefore, look forward to the time when we may send our captains to sea with the wind that is to blow them in their waistcoat pocket; and it is not impossible, that we may get rid of those ugly smoky chimnies, which are at once so unspectacular and unpicturesque, and against which our sailors so bitterly complain, because they deface the surface of our beautiful sea.

A railroad was about to be constructed between Havana and the town of Guines, and a loan of two millions authorized in England, to carry the plan into effect.

*Bridge across the Hudson.*—At a highly respectable meeting held at Albany on Wednesday, Feb. 4th, a committee of 30 was appointed to draw up a petition to the Legislature on the subject of a bridge across the Hudson.

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, FEBRUARY 14, 1835.

**POSTAGE—MISSING NUMBERS.**—It affords us pleasure to supply deficient numbers of the Journal; although great care is taken to put them up so that they will go safe, (and we cannot, of course, guarantee all losses in the post-office,) we cannot, we again repeat, pay postage on letters asking us to supply deficiencies.

Postage must be paid, or the numbers will not be sent.

We owe an apology to Mr. Cushman for the delay in publishing his communication on undulating railways. It should have appeared several weeks since, but it was accidentally omitted—which omission, however, will not, we trust, cause him to omit us as we have, unintentionally, his communication.

We are indebted to an unknown friend for the report of the canal commissioners in relation to the survey of the Black river canal. We shall look at and give some notice of it soon, together with some others before received.

We have also received a copy of the proceedings of a meeting of citizens held at JAMES'S HORSE, in this city, on the evening of the 7th inst., favorable to the Genesee and Allegany canal; a part of which will be given in our next number.

**LA PORT, INDIANA, AND MICHIGAN CITY RAILROAD.**—It is expected, we understand, that a charter will be granted by the Le-

gislature of Indiana, for a railroad from La Port to Michigan City—on Lake Michigan.

The following statement will, we hope, induce others, or "Usus," to give a similar account of cost of transportation on other roads and canals.

To the Editor of the Railroad Journal:

SIR,—Your correspondent from Michigan calls for the charges of conveyance on various railroads, that he and others may judge of the comparative cost of the transportation of heavy articles, long distances on canals and railroads. I will state, in advance, that where speed is not taken into account, that it is my belief that canals are vastly preferable to railroads, for the transportation of all commodities, of whatever name or nature.

Canals cannot, however, be constructed in every place, and therefore I am decidedly in favor of railroads, judiciously located. I believe the charges on the Baltimore and Ohio Railroad will exhibit nearly the minimum prices in comparison with all other roads, and therefore is the most favorable view that ought at present to be taken.

The price for which conveyance is effected on that road, is, for all commodities transported westwardly, six cents per ton per mile; and for the same transported eastwardly, four cents per ton per mile; reckoning the ton at 2,240 lbs. For light, bulky articles, they frequently charge by the cubic foot, counting a certain number of cubic feet to a ton.

The charges on wool, feathers, or furniture, boxed, amounts to a sum much greater than 6 cents per ton per mile. They moreover frequently let their cars to individuals, to be by them laden with light articles; and after the car is so laden, it is rated at two and a half tons. In most cases, they also charge 30 cents per ton for loading and unloading.

The following exhibit may serve to show what it would cost the owner of property to transport country produce eastwardly 363 miles on a railroad, at Baltimore and Ohio Railroad charges, viz.—

At 4 cts. pr. mls.		Total.
2,240 lbs. \$14.52	—charges 30 cts.	\$14.82
2,000 lbs. 12.96	" 27 "	13.23
216 " 1.40	" 3 "	1.43
100 " 84	" 2 "	.67
160 " 58	" 2 "	.41

Therefore, the charges on one bushel of wheat would be 41 cents; on one barrel of flour, \$1 43.

For passengers, the charge is three cents per mile invariably, and sometimes a charge of 12½ cents on each trunk accompanying any passenger 60 miles. As to our Erie Canal, I cannot speak so definitely as to the exact cost of transportation, and would wish therefore that some person may make a table of average prices, including toll, transportation, and charges, and communicate the same to you for insertion.

I however believe that a sum less than two thirds the amount charged on railroads would cover all expenses. It must be borne in mind, too, at the same time that the Erie Canal is paying annually a good interest, and speedily liquidating the debt contracted for its construction; while the Baltimore and Ohio Railroad Company have been scarcely able to pay a dividend of 4 per cent. per annum.†

This last difference is the most astonishing of the whole calculation. However, in favor of the railroad, it may be said that it has not yet been brought to its intended extension and termination, and that it is only in its infancy—yes, barely in embryo.

The tolls received on account of the Erie and Champlain Canals were \$1,318,155 84. The expenses of same for lock tenders, weighmasters, and assistants, repairs, cost of suits, &c. &c., \$458,526 62. Which, deducted from the amount received, will leave \$854,629 22: a sum more than equal to the interest of \$12,206,967, at 7 per cent. per annum.

Should your subscriber in Michigan want more information, and will state his wants in a series of questions, I hope myself, or some one more able, may inform him.

UNUS.

\* The weight of one barrel of flour.

† The weight of one bushel of wheat.

‡ This is not, as the writer admits, a fair comparison. The Baltimore and Ohio Railroad being only one-fourth completed, whilst the canal has been for near 10 years in successful operation, besides its numerous lateral branches and the immense inland sea with which it is connected.—(E. R. J.)

**UNDULATING RAILWAYS.**—This subject seems to attract the attention of engineers in this country as well as in England. It is in our opinion a subject of importance, and we hope to see thoroughly tested.

To the Editor of the Railroad Journal, &c.

SIR,—In a former communication upon the subject of "Undulating Railways," (see Railroad Journal, vol. iii., p. 130,) were offered some strictures confined entirely to the experiments made by Mr. Badnall, upon the Liverpool and Manchester railway, intended to evince that the inferences drawn from those experiments were erroneous and absurd. In that paper, too, was hinted the probability that this projector was deceived by preconceived theoretical notions, believing that his delusion arose in drawing general conclusions from instances which were practically unsusceptible of any useful application in railway economy.

The subject is renewed with reluctance; but, professionally, as credenda of the engineer, as well as in view of a due estimation of the system in other respects, it may be proper. In so doing, it is now proposed to take a wider survey of its merits—a survey embracing the feasibility of the general principle of "undulating railways," upon the plan of Mr. Badnall; for every engineer understands that, to a greater or less extent, undula-

tions exist upon almost every railway, and are indispensable, while the present terrene distribution of hill and valley endures; that, in this way, to surmount acclivities and obstacles, that by canals would be quite infeasible, is, indeed, one of their chief characteristics—one which, in a majority of instances, insures the system of railways' pre-eminence.

Before proceeding to the merits of the question, it will be proper to premise dynamical theorems, by means of which general comparisons of results may be instituted. The two which follow, dependent upon the laws of forces, will suffice for this purpose.

$$s = \phi t + \frac{1}{2} g t^2 \mp q + \mu - m. \quad (1.)$$

$$v = \phi + g t \mp q + \mu - m. \quad (2.)$$

In which  $\phi$  = velocity of projection;  $v$  = velocity at the end of any time;  $t$ , during which the space,  $s$ , has been passed over;  $q$  = sine of inclination of plane, whereon any body, as a car, moves;  $\mu$  = any constant motive force;  $m$  = that portion of resistance from friction which is constant—the two latter quantities being each compared with gravity taken as unity;  $g$  = the velocity acquired by a body at the earth's surface, urged by the force of gravity, at the end of the first second; and the compound expression  $\mp q + \mu - m$  = resultant of all constant forces which influence its motion.

and by the same reasoning, it appears that such increment of power must, at a minimum, be adequate to traverse all other portions of a line of railway.

It is frequently necessary to submit to resistances requiring a motive force of .015. Engines, whose powers do not equal or transcend this force, would have little efficiency upon any general lines of railway that are or may be constructed; the geological features of the globe offering insurmountable impediments to a materially different result.

Thus constrained to employ a motive force equal or near this value, it is highly pertinent to the inquiry to discover what modification results therefrom: the subjoined will be among the most material.

1. It has been shown that, when the motive force is barely equivalent to friction, the disparity between the performance upon the level and upon the inclinations is limitless: reciprocally, when the motive force becomes infinite, the performance upon either would be equal. It follows thence, that, between these extremes, as the motive force is enhanced, the performances approach equality. An approach, at least, towards equality of performance, ought, then, to obtain in consequence of the value of  $\mu$ , necessarily, standing comparatively high.

2. The resistance or assistance from gravity being directly as  $q$ , since a deviation from the assigned limit ought, for reasons already advanced, to be made in diminution of that value, this would obviously further tend to approximate the performances at points where that limit is unattainable.

These considerations alone place the impropriety of general conclusions, from a particular case, in a light to be justly appreciated.

Still there is another consideration, of the highest import to a fair estimation of the principle, as yet untouched.

It has all along been implied that the body at B is at rest; in that case, too, it would cease to move when it should have arrived at D. But this, again, is clearly inadmissible. Alternations of rest and motion in the midst of an unobstructed way are subversive of the very system. Admitting the invincible necessity, practically, of arriving and starting at these points with considerable projectile velocity, it is evident that its effects are substantially the same with the first mentioned—that, as it increases, it favors the level. This, then, is another weighty reason for the disparity of the ratio of performances to vanish.

With these preliminaries we proceed to a comparison of instances. Suppose there were two planes disposed, as in the diagram, whose common sine was .01, and their lengths 1000 feet; and, further, suppose the motive force,  $\mu$ , just sufficient to preserve the dynamical equilibrium up the planes—i. e., rating friction at  $\frac{1}{10}$ , or .0044, to .0144. If, moreover, the projectile velocity at the head of the planes be estimated at the moderate speed, for locomotive power, of 20 feet the second, (nearly 13 miles the hour,) we

Take now the profile A, B, C, D, E, &c., having an undulation B, C, D, and because, with locomotive power, grades steeper than 50 feet to the mile, or thereabouts, are inadmissible, the utmost practical limit for  $g$  may be placed at .01,\* which make the common sine of inclination of the planes BC, CD. Take further the lengths of the planes equal: their altitudes will then be equal, and BD in the same horizontal plane.

In the first instance, supposing we have no force but that of gravity, the following effects would result to a body placed at the summit of the plane CB.

The sine of inclination being greater than the known value of friction, the body will roll down BC; but in consequence of the constant retardative influence of friction, its momentum at C will not equal that due gravitation—it will not therefore suffice to elevate it up the plane CD. Further, because friction continues its influence up CD, the distance it would otherwise ascend upon that plane will be still farther diminished.

\* Thus: the gross load of a train being supposed 40 tons, and its engine 6 tons, and 3-5ths of the weight of the engine upon the drivers—then 3-5ths of 6 = 3 6/10 tons, or 8,064 lbs., will be the absolute weight inconstant upon them. Further, taking the mean adhesion at the liberal estimate of 1-10th, there results, for the absolute value of the adhesion of the peripheries, 806 4-10 lbs. Its force of traction cannot exceed this amount.

Now 40 tons = 89,600 lbs.; consequently, the force of traction due gravity alone, upon a grade whose inclination is .01, is 896 lbs.—about 1-9 greater than the adhesion, without estimating resistance from friction. The above is then quite as great as would be admissible.

Without the application of a motive force, it is, then, impossible to attain any useful result, even if it were possible to concatenate a series of counter-planes, each consecutive pair, at least, having a common altitude. Yet this would be the *ideal* of the "undulating railway."

In gravity, consequently, a motive force, at least equivalent to friction, must be advanced before it would be even possible to elevate the body up the plane CD to D. If this be done, the performance would be infinitely in favor of the inclined profile, because, the motive force being a bare countervail to friction, no performance could result upon the level: that is, it would be thus, if precisely at the point D a declivity commenced, having a correspondent counter-plane, and so on between the termini of the road.

But this is out of the question. Such a structure is entirely visionary. Occasionally in selecting the site for a railway, a conformation of country presents itself where a pair of counter-planes could be constructed; but from the invincible nature of things, the intermedial parts must have different positions; and power, unless adapted to meet and overcome the resistances they offer, would be entirely ineffectual.

Secondly, then, it appears, no useful result can flow from the employment of a force barely equivalent to resistance from friction. Consequently, a power greater than that indicated must be employed;

shall have sound practical values for  $\phi$ ,  $q$ ,  $m$ ,  $\mu$ ; and by the theorems, we at once obtain the comparative performances of two similar trains upon the inclinations, and upon the level: thus—

*Upon the inclinations:*

Time of descent down B C is, (by theorem 1,) 82.75 seconds.

Terminal velocity is, (by theorem 2,) 41.67 feet per second.

Time of traversing both planes is, 65.50 seconds.

Which gives a mean velocity of 30.54 feet the second.

Terminal velocity, (same as projectile,) 20 feet the second.

*Upon the level:*

Time same as upon inclinations, 65.5 seconds.

Distance traversed in that time is, (theo. 1, making  $q = 0$ ), 2,000 feet.

The mean velocity is then the same, 30.54 feet the second.

The terminal velocity is, (theo. 2, making  $q = 0$ ), 29.75 ft. the second.

On comparison of the mean velocities for both systems, can the conclusion be resisted, that—even when only that portion of resistance which is constant is accounted—there is no gain by the system of counter-planes? and that, when the final velocities are considered, there is a decisive loss by that plan, seeing that they stand as 29.75 : 20, nearly  $\frac{3}{4}$  in favor of the level? Were the velocities to become uniform, after the horizontal velocity of 26  $\frac{1}{2}$  miles the hour had been attained, the effect of the latter would be thus: at the instant of absolute time this took place, (65  $\frac{1}{2}$  seconds after passing D,) with the engine which had run upon the inclinations, its fellow, which had run upon the level throughout, would be 487 feet in advance; and so on for every similar subsequent portion of the railroad.

Should the conditions prescribed, obtain in practice, we may assert, in general, the inferiority of the "undulating system" of railways.

Reasons for assigning .01, as about the limit for inclinations, upon that plan, have already been given. In respect to length of plane, safety alone, (to apply the convey, or abate the motive force, is bane to the principle, because acceleration, its sole basis, is thereby checked,) indicates the length assigned above, as near the practical limit wherever the two plans may come in competition: for, in consequence of acceleration, the terminal velocities would be greater than are consistent with safety. On longer planes, by reason of lateral friction, the resistance of the atmosphere, velocity becoming uniform, &c., aside from danger, the effects of acceleration disappear: hence, the case chosen will be near actual limits for all restraints, while, for that reason, it is the most favorable to the "undulating system." The cases falling within these limits, will, of course, be still more opposed to the inclined road.

In what precedes, that portion of resistance which is constant has alone been regarded. There are, however, other

sources very material to a due estimation of the system—as, the atmosphere—the retardation from centrifugal force on curvatures—and the casual infringement of the flanges of wheels against the rails.

Upon long planes the latter operates; indeed, upon all inclined planes, it operates, beyond what obtains on levels, very sensibly in opposing the basis of the system—acceleration.

The exponent of the law of increase of resistance from the atmosphere, at varying velocities, being greater than unity, in all accelerated motions its mean effect will stand far higher upon the inclinations than upon the horizontal way; and therefore against inclinations. The latter remark applies as forcibly to resistances from curvatures.

We should err, then, most egregiously, if neglecting all those highly material resistances, results as favorable to inclinations as our theorems give were anticipated in actual experiment. Of this, look where we may, there will not be found any more striking or decisive confirmation than the experiments conducted by Mr. Badnall upon the Liverpool road. They indicate an inferiority by the counter-plane system, varying from  $\frac{1}{4}$  to nearly  $\frac{1}{2}$ . [Vide Railr. J., vol. iii. p. 130, col. 3.] Reasoning a priori from the known laws of mechanics, leads thus to results perfectly coincident with experiment: the larger diminution of effect in these experiments being satisfactorily accounted for in the exclusion, from our theorems, of the material resistances just recited.

All delusion, it would seem, then, in regard to the demerits of the "undulating railway," consists in the hallucination of inferring general practical results from a particular case, which can only exist in theory. It is a little singular that a gentleman, of the intellectual acumen the reassurer of the old fallacy of undulation has evinced, in many communications to the public upon the subject, should, despite his own experiments, commit so obvious and unphilosophical an oversight.

In our computations, it may be objected no allowance has been made for diminution of friction upon inclinations. True; but even in theory, the difference is entirely insignificant; for, within the limits assigned to the inclinations, the ratio of cosine to radius is almost precisely a ratio of equality—and it is in that ratio that it can alone be lessened. In a practical view, we opine, that even this immaterial quantity disappears, in consequence of the bearing surface being diminished by the larger weight being thrown upon one pair of wheels.

Perhaps exceptions may also be taken to the supposition that the planes are of equal altitudes. The obvious rejoinder is, the inclinations are inferior in the case of a common altitude, which is that most favorable to the plan; therefore, a fortiori, &c.

The expectation of realizing economy of power, with its pecuniary implications, and public and private benefits, appears, upon overlooking the whole grounds we have taken, to be entirely groundless.

There are, however, still other objections yet unenumerated. Besides inferiority in point of power and danger from high speeds, it would be highly destructive to machinery; all intermissive irregular motions are unfavorable to its duration, safety, and economy: especially does this remark apply to the delicate, nicely adjusted machinery of railways.

The road way would depreciate more rapidly in consequence of the larger weight being thrown upon a single pair of wheels.

Concussions between the advance and rear of a train of cars, when passing the apex of the planes, could not be obviated, even though it were rounded to the arc of a circle, or though the entire inclinations were arcs of the circle, or any other curve. Both danger and damage would thence ensue.

The system and locomotive power mutually antagonize; at the high speeds inexorably required by the plan, the elasticity of steam would be largely reduced—a circumstance adverse to acceleration, &c.

The only entity, in the shape of an advantage, the system presents, in contravention of a series of disadvantages—either of which would go far towards countervailing any benefit of this kind—it appears, consists in economy of embankment; and, possibly, at some points, of excavation at those points where the plans come in competition; there is little danger of the skillful, scientific engineer, being deluded by a purblind economy in this respect, where adequate advantages are not clearly secured.

W. M. CUSHMAN, C. E.  
Albany, December 22d, 1834.

NEW-YORK AND ERIE RAILROAD.  
Board of Assistant Aldermen,  
February 4, 1835.

Report of the Special Committee of both Boards, in respect to the New-York and Erie Railroad; adopted, and double the usual number of the report ordered to be printed, together with one hundred of the map which accompanied it. Presented by Wm. S. Johnson.

R. FISHER, Clerk.

Resolution relative to the measures proper to be adopted by the city of New-York to promote the construction of the New-York and Erie Railroad.

Whereas, the immense augmentation which has been experienced in the extent, wealth, and prosperity of the city of New-York, since the completion of the canals of this state, signally demonstrates the value and necessity of artificial channels of commercial communication, connecting the metropolis with the populous and fertile regions of the interior.

And whereas, several works leading into the State of Ohio, from ports on the Atlantic sea-board, south of this city, are now constructing, and are rapidly advancing to completion, under the direction of various companies, incorporated and powerfully patronised by the State of Pennsylvania, Maryland, and Virginia, seeking to divert from the city of New-York the extensive and lucrative commerce which it has heretofore enjoyed with the rich and rapidly increasing States and Territories north of the

Ohio river, and relying for success upon the greater severity of climate experienced in the more northerly latitude of the State of New-York; whereby the navigation of its canals is suspended during a large portion of the year: And whereas, it has become vitally important to the commerce of this metropolis, to obviate the difficulties and disadvantages to which it is thus subjected, which object can only be obtained by constructing additional channels of trade and intercourse, by means of railroads leading directly from the city to the western waters, and available for commercial purposes at all seasons of the year:—

And whereas, the Legislature of this State at their last session directed the route of a railroad to be surveyed under the direction of the Executive, through the southern counties of the State, from the Hudson river to Lake Erie, for the purpose of ascertaining whether the public interest would be promoted by a subscription on the part of the state to a portion of the capital stock of the New-York and Erie Railroad Company, which was incorporated in the year 1832, for the purpose of constructing such road, whereby the Commonwealth at large might participate in the burthens and benefits of that undertaking, or in what other mode the general objects sought to be accomplished by that act of incorporation, might properly be encouraged by the public authorities:—

And whereas, it is now satisfactorily ascertained, by means of that survey, that, in case the State shall co-operate and participate in the enterprise, the whole of the road in question can be completed within four years, from the 1st day of May, 1835, and a communication thereby provided, by which passengers and merchandise may be regularly transported, at all seasons of the year, in less than forty hours, from the city of New-York to the southern shore of Lake Erie, communicating also by means of the Allegany river, directly with the valley of the Ohio:—

And whereas, the inhabitants of this city are deeply interested in the prosecution and speedy accomplishment of this most important undertaking, tending, as it plainly must, to attract and secure forever to this emporium the vast and expanding trade of the most fertile, valuable, and populous portion of the continent, thereby augmenting its commerce, prosperity, and wealth, to an incalculable extent:—

Therefore, resolved, (if the Board of Aldermen concur herewith,) that it be referred to a joint committee of three members of each board, to report resolutions signifying the sense which the Common Council entertain of the necessity, importance, and value of the proposed work, and to inquire and report what measures, if any, the city may properly adopt to promote and secure its speedy execution.

The Special Committee from the Board of Aldermen and Assistant Aldermen of the city of New-York, to whom was referred the resolution of Assistant Alderman Johnson, touching the necessity, importance, and value, of the proposed railroad through the southern counties of this State, from the Hudson River to Lake Erie, respectfully beg leave hereby to report,

That, for the purpose of being more fully informed of the details of the subject thus referred to their consideration, they have summoned before them several of the directors of the New-York and Erie Railroad Company, incorporated in the year 1832, for the purpose of constructing the proposed road; and have also been attended, at their

request, by Benjamin Wright, Esq., and his assistant engineers, under whose care the route of the road has been recently surveyed. From these individuals the Committee received very full and satisfactory explanations; and, nevertheless, the Committee, being conscious of the momentous importance of the subject under examination, felt it also to be their duty to satisfy themselves, as far as was practicable, from auxiliary sources of information, of the accuracy of the details which were elicited on this interesting examination. It fortunately happened that one of the Committee,\* by having been engaged for a considerable time in a work of public improvement, intersected by the route of the proposed road, had become considerably familiar with the topography, and also with the trade and resources of that portion of the country, and was thereby enabled greatly to facilitate the examinations of the Committee.

The Committee, moreover, deemed it proper that they should make no statements affecting a subject so deeply interesting to the community at large, without a full and sufficient scrutiny, and they have therefore pursued their examination with a minuteness of inquiry which has brought them into acquaintance with many interesting details, which they may deem it expedient hereafter to make the subject of a supplemental report.

In the mean time they beg leave to present to the Common Council the present summary statement of the facts which have been ascertained by their examination.

In the first place, then, they report, that after full inspection of the maps and plans returned by Judge Wright, and copious explanations from himself and his assistants, they are entirely satisfied that it is practicable to construct the proposed road, and that it will afford the means of transporting passengers, merchandise and the public mails, at all seasons of the year, in less than 48 hours from the city of New-York to Lake Erie.

The road after leaving Rockland and Orange counties, will follow successively the large vallies of the Delaware, the Susquehanna and the Allegany, and thereby obtain the easy grades of declivity naturally pursued by those streams. The surface of much of the country adjacent to the line is undulating, but the apparent difficulties which are thereby presented, are avoided by the following the water courses.

In the language of Judge Wright, the road "goes *around* instead of *over* the hills." The whole line of the route is 493 miles, capable, however, of being shortened to 460 miles; but it is not comparatively more circuitous than the canals of Pennsylvania. The ascents on much the greatest portion of the route are generally from 5 to 30 feet per mile, and do not exceed 60 feet per mile, except in five or six instances, where the line crosses the natural boundaries of the large vallies. No stationary engine or inclined plane will be necessary on any part of the road, except in one instance, about four miles from Lake Erie, and even that may be dispensed with by altering the grade for eight miles, at a moderate expense. Locomotive engines, drawing passenger cars, may be propelled over every portion of the road (except the inclined plane) with economy and advantage; and at the points where the rate of acclivity exceeds sixty feet to the mile, the passage

\* John Bolton, Esq., late President of the Delaware and Hudson Canal Company.

of burthen cars heavily loaded may be easily and cheaply expedited, either by auxiliary locomotive engines, or an addition of animal power. It is quite certain that passengers may be carried over the road with great celerity and profit, and from the testimony taken before the Committee, and the personal information of one or more of its members, they are entirely satisfied that the road will also serve to transport to tide water the lumber, provisions, live stock, fuel, and agricultural products of the region of country adjacent to the route and its contemplated branches, and carry back merchandize in return, more cheaply and advantageously than can be effected by any other channel of communication.

The road will be intersected by several lateral branches and canals, which will greatly increase its revenue and its importance. In the western part of Orange county, it intersects the Delaware and Hudson Canal: in Broome county, the Chenango Canal: in Tioga county, the Chemung Canal: in Delaware county, it will be connected with a branch leading up to Delhi: in Otsego county, by a very important and valuable branch leading up the valley of the Unadilla to Utica, for which a charter is obtained and the stock already subscribed; a branch will lead through the valley of the Onondaga River, in the county of Cortland, to the Salt Works at Syracuse: at Owego, the railroad, now finished to Ithaca, will immediately connect the main line with the fertile country adjacent to the Cayuga and Seneca Lakes: by the line of steamboat navigation now in preparation on the Susquehanna at Owego, it will be united to the valley of Wyoming and the coal regions of Pennsylvania: the contemplated railroad from Rochester to Danville, if extended a few miles, will intersect the main line in Steuben county: in Allegany county, it will intersect the contemplated route of the Rochester and Olean canal: and it will become connected in Cataraugus county with the Allegany River, and thereby open a direct communication between the city of New-York and the large and populous communities and cities in the valley of the Ohio. The map of the proposed route annexed to this report, fully exhibits these several localities, and is well worthy the attention of the Common Council.

2. The Committee are of opinion that this work will afford immense public benefits to the inhabitants of this metropolis.

The rapid, constant, and regular communication it will insure at all seasons of the year, with the extensive and fertile grazing districts in the counties of Orange and Delaware, and the valley of the Susquehanna, will cheapen the price of subsistence, by affording abundant and uninterrupted supplies of provisions for the public markets; the excellent and valuable timber furnished by the counties of Steuben, Allegany, and Cataraugus, by reducing the cost of building, will accelerate the growth of the city, and at the same time facilitate the operations of ship building; the rapid and regular passage it will secure to the public mails, will insure the speedy transmission of commercial intelligence; it will provide for the public defence, by affording the means of military communication with unparalleled speed between the Atlantic and Western frontiers; while the comfort and health of our citizens will be promoted by obtaining cheap and frequent access to the healthful regions of the interior.

3. The speedy completion of the work has now become an object of transcendent importance to the merchants, traders, and

land owners of this city, in order to preserve and extend its great and lucrative trade with the West.

The important and alarming truth can no longer escape the attention of our municipal authorities, that the intercourse between this city and the great West, to which it owes so large a share of its present prosperity and power, is totally suspended during five months of the year. Availing themselves of that circumstance, the public spirited citizens of Pennsylvania have constructed, and have now recently completed, a line of canals and railroads from Philadelphia to Pittsburgh, which are available for the purposes of trade and intercourse during at least two months of the year, in which the navigation of the New-York canals is suspended by the greater severity of their more northern latitude. The Erie canal is not usually navigable until the 20th of April, and rarely remains open after the 20th of November. The canals of Pennsylvania, favored by a more southern climate, are generally navigable about the 10th of March, and remain so until the 25th of December. The merchants of Philadelphia are thereby enabled to monopolize the western trade during portions of the spring and autumn peculiarly valuable for commercial purposes. Even after the navigation is opened on the Erie canal, the intercourse between New-York and the West is obstructed for a considerable time by the ice accumulated during the months of March and April, in the harbor of Buffalo, while the navigation of the Ohio river being open at Pittsburgh during that important season of the year, the produce of the West finds its way to Philadelphia, and its proceeds are invested in merchandize, and transported into the remotest portions of the interior, before vessels are able to navigate the eastern end of Lake Erie. The intelligent and enterprising merchants of Philadelphia, supported by the spirited efforts of their Board of Trade, are striving to follow up this advantage, by promoting, with great zeal, the construction of lateral canals and railroads by the state of Ohio, and by private companies, extending northwesterly from the Pennsylvania line to the Ohio Canal, for the purpose of effecting a communication between Pittsburgh and the harbor of Cleveland, on Lake Erie; and that too for the avowed object of diverting from the city of New-York the lucrative commerce which it would otherwise enjoy with the northern parts of Ohio, Indiana, Illinois, and Michigan.

There is no mode of successful competition with these efforts of our public-spirited rivals, except by opening a winter communication between this city and the harbors on the wider part of Lake Erie.

The proposed road will accomplish that object by affording the means of transmitting merchandize at all seasons of the year within forty-eight hours from the warehouses of New-York to the harbors of Dunkirk, Portland, or Erie, while its connexion with the cheap descending navigation of the Allegany River, (which is generally available in the latter part of February, and early in March, and is capable, with small expense, of being rendered navigable for steamboats at all seasons of the year,) will enable the merchants of our city to furnish the cities of Pittsburgh, Cincinnati, and the other trading towns in the valley of the Ohio, with their spring supplies, before the opening of navigation on the Pennsylvania Canal. The speedy completion of this road will moreover encourage and hasten its speedy continuation by great

western and southern branches, leading from Lake Erie to various points on the western and south-western waters, whereby passengers, merchandize, and the mail, may be transmitted in six days from New-York to St. Louis: and thus this great central channel of intercourse, lying wholly within the limits of our own state, and subject to its sole jurisdiction, will become the main trunk of a connected system, or series of internal communications, extending from the port of New-York, throughout the populous regions in the vast and fertile valley of the Mississippi.

The statistical particulars of these great lines of western communication, and the important influence they will exert in directing the trade of those vast inland regions into Lake Erie, and thence to the city of New-York, will be found in an interesting letter furnished to the committee by one of the directors of the company, which is annexed to this report, and is recommended to the attention of the Common Council as a document of much importance.

4. The preservation of the trade of these great inland districts, by connecting them closely with this city by means of cheap and rapid channels of communication, has become an object of the deepest solicitude to the landholders of New-York, and every person interested in its permanent prosperity.

The past growth, and in truth the very existence of this metropolis, are wholly owing to the facilities of communication it possesses with the agricultural population of the interior. The Erie Canal opened a channel of intercourse during seven months of the year, between the port of New-York and inland districts containing little more than a million of inhabitants, and yet within ten years from its completion, the assessed value of the landed property of the city was augmented from 52 to 114 millions of dollars. The completion of the proposed road will bring into constant connexion with the city of New-York an increased amount of territory, already containing three, and destined, within six years, to number more than six millions of inhabitants; while the impulse imparted to the agricultural prosperity of those inland communities, by the facilities afforded to them for cheap and expeditious communication with their trading emporium, will augment to a corresponding extent their capabilities of pursuing a profitable commerce with the sea-board.

It has been frequently, and by no means extravagantly, stated, that the construction of the Erie Canal, by diminishing the time and labor expended in transportation, has saved annually to the citizens of this state not less than \$5,000,000, and added at least \$150,000,000, to their aggregate wealth. This immense and rapid augmentation of value will afford a criterion, although imperfect, by which to estimate some portion of the pecuniary benefits to be derived by the public, from the opening of a communication not less cheap, more regular, and far more expeditious than the canal between this metropolis and a district of fertile territory, embracing an area more than eight times as large as the state of New-York, west of Utica. To calculate with any accuracy the value of the vast and illimitable trade which, within twenty years, will be concentrated upon the waters of Lake Erie, destined before the present generation shall pass away, to number more than a thousand vessels, and to bear on its surface the wealth of at least twenty millions of the American people, or to com-

pute the prodigious rise in value which the landed property on the Island of New-York will experience, when the immense and expanding commerce of these great inland communities shall be concentrated within its limits, will not be attempted; but it will be confidently claimed that the increase in the value of the real estate in this city within the first ten years after completing the proposed road, will repay more than tenfold the whole cost of its construction, and that the augmentation in the population and wealth of the immense and fertile regions which will be brought by its completion within four days' travel of the sea-board, will defy all attempts at sober calculation.

5. In what mode, then, can this great enterprise, promising public advantages thus enormous, be most effectually and speedily accomplished?

In the year 1832, the standing committee on internal improvements in the Legislature of this state, after full examination of this and other projects of inland communication, reported that it would not be politic for the state, as such, to construct railroads; and for the obvious reason, that the owners of the road must manage the transportation, and the state could not become common carriers. But the committee recommended the incorporation of companies, whenever individuals should see fit to risk their property in constructing railroads, reserving, however, the right, which is reserved in all other acts of incorporation, to repeal or modify the charters. The committee also recommended that the state should subscribe to portions of stock in this and all the other great leading routes, whereby the public at large might participate, to a certain extent, in their pecuniary profits, (if any,) and at the same time secure the economical management resulting from the vigilant attention of individual proprietors.

The annual message of the Governor to the Legislature at the opening of the session in that year, after stating that the construction of railroads in various parts of the state would "become eminently promotive of the public good," but that "many generations must pass away before the numerous improvements worthy of the state could be undertaken by the public means alone," recommended that companies of individual proprietors be incorporated with power to construct them, reserving, however, to the Legislature, the right secured in all the recent acts of incorporation, to take possession of the roads as public property, on equitable terms.

The Legislature, accordingly, in the year 1832, chartered a company for the purpose of making the proposed road, (subject to the reservations recommended by the Governor,) with leave to issue capital stock to the amount of \$10,000,000, requiring them to expend \$200,000 before April, 1837; to finish one quarter of the work before April, 1842; one half before April, 1847; and the whole before April, 1852; and authorising them to receive donations of lands to aid in the construction of the work. By an amendment, obtained in 1833, the company were empowered to organize themselves, on receiving subscriptions of stock for one million of dollars. That amount was duly subscribed, and is now holden principally by merchants, land-holders, and other inhabitants of this city, deeply interested in its permanent prosperity, and anxious to complete the proposed work with all practicable despatch.

In order to ascertain how far the public interest would be promoted by a subscription to the stock on the part of the State,

the Legislature in May, 1824, authorized the route to be surveyed at the public expense. In the mean time the Directors of the Company have been actively employed in making the inquiries and investigations necessary to the prosecution of their object, adopting measures calculated to secure the confidence of capitalists, and obtaining donations towards their work from large proprietors on the route; and they have met with such success and such encouraging assurances, that they are confident of being enabled to commence the road during the ensuing season, and they believe that in case the legislature should authorize a subscription by the State, for a portion of the stock, or a loan of its credit to the company, they can complete a single track of their road over the whole route within five years.

The expense of the whole work, as estimated by Judge Wright, including the graduation for a double track throughout on solid earth embankments, and laying down a single track ready for use from the Hudson River to Lake Erie, will not exceed \$4,762,000. The graduation of more than one half of the line does not exceed \$4,000 per mile. The whole route is embraced in six large divisions, to wit:

The *First, or Hudson River Division*, extending 73½ miles from a point on the Hudson River, near the southern extremity of Rockland county, (distant 24 miles north of the City Hall of New-York,) to a point in the Deer-park Gap of the Shawangunk mountain near the west line of Orange County, dividing the waters of the Hudson from those of the Delaware:

The *Second, or Delaware Division*, extending 115 miles from the point last mentioned, through the valley of the Delaware and its tributaries, to a point near Bettsburgh, in Chenango County, dividing the waters of the Delaware from those of the Susquehanna:

The *Third, or Susquehanna Division*, extending from the point last mentioned 163½ miles along the valley of the Susquehanna and its branches, to a point near the west line of Steuben county, dividing the waters of the Susquehanna from those of the Genesee:

The *Fourth, or Genesee Division*, extending from the point last mentioned 37 miles, across the valley of the Genesee, to a point near the east line of Cattaraugus county, dividing the waters of the Genesee from those of the Alleghany:

The *Fifth, or Alleghany Division*, extending from the point last mentioned, 83 miles along the valley of the Alleghany and its tributaries, (situated at the northern extremity of the great valley of the Ohio,) to the head of the inclined plane, near Lake Erie:

The *Sixth, or Lake Erie Division*, comprehending the short and rapid descent to the shore of the lake, including the inclined plane and two branches of the road, one to the harbor of Dunkirk, 8½ miles, and one to Portland, 9 miles.

6. The execution of this most valuable and necessary work being thus shown to be free from physical difficulties, and capable of being completed at a moderate expense, the question then arises, of much importance to the public, and one which the Committee deemed it their duty fully to examine, whether the Company now incorporated possess sufficient means and resources to complete the road with the energy and despatch which the public interest requires. The Committee, in prosecuting this inquiry, have personally examined the officers, directors, and books of the

Company, and from that personal inspection they have become entirely satisfied, that the stock of the company is held by individuals greatly interested in the permanent prosperity of the city, deeply conscious of the importance of the proposed road in advancing the general, as well as their individual prosperity, and fully determined to spare no effort to insure its speedy completion. The concerns of the Company are now managed by 17 directors, 14 of whom, to wit: James G. King, the President, Eleazer Lord, the Vice President, Peter G. Stuyvesant, John G. Coster, John Rathbone, jun., Gould Hoyt, Samuel B. Ruggles, J. Green Pearson, Elihu Townsend, Peter Harmony, Stephen Whitney, James Boorman, John Duer, and Michael Burnham, reside in this city, and are well known to their fellow citizens; and the remaining three, to wit: Jeremiah Pierson, George D. Wickham, and Joshua Whitney, reside in the counties along the route, and equally command the confidence of the inhabitants of that part of the State.

The committee have also satisfied themselves, by personal inspection, that the first instalment required on the million of dollars, heretofore subscribed to the stock, has been regularly paid in cash, and that it is now duly deposited upon interest, with the New-York Life Insurance and Trust Company, subject to the joint order of the President and Vice-President of the New-York and Erie Railroad Company.

It was not necessary, nor would it have been at all prudent or expedient, for the Directors to have proceeded in the actual construction of the road, until the route should have been surveyed; and it was also deemed highly desirable that the survey should be finished, which had been ordered by the State, in order more perfectly to secure and confirm the confidence of the large capitalists, whose co-operation was absolutely necessary in the prosecution of so great an enterprise.

The very favorable results ascertained by Judge Wright, and by his report to the Secretary of State, presented about the first of this month, a copy of which is herewith subjoined, have entirely confirmed the belief previously entertained, that the work is perfectly feasible; and that it will be profitable not only to the community, but to the stockholders, who may embark their funds in its construction. The committee are assured that the Directors intend forthwith to open books for private subscriptions, for the additional amount of two millions, and that they entertain the most perfect confidence, that by means of the subscriptions already obtained, and the assurances of valuable donations of lands along the route, tendered to them by the inhabitants (all but unanimously) along the whole route, and of their zealous and hearty co-operation, recently and repeatedly, and at all times expressed in their town and county conventions, the Company will be enabled to commence the actual execution of the work during the ensuing season, and nearly two years before the time allowed for that purpose in the charter; and that in case the State shall loan its credit, or subscribe for the stock to an amount not exceeding one third of the cost of the road, the Company can complete the whole from the Hudson River to Lake Erie, within five years. And the committee are further satisfied, that even if the State shall decline to extend any aid to the Company, and they shall be left to their own unaided resources, they can within two years complete the second or Delaware division of

the road, and thereby divert to this city, through the Delaware and Hudson Canal, a large portion of the exports now passing out of this State, down the Susquehanna River:—and it is moreover confidently believed, that the productiveness of that division, by demonstrating the value of the whole work, will sustain the credit of the stock, and enable the Directors to extend the road without delay to Lake Erie.

The inquiry then arises as to the mode in which it will be proper and expedient for the Common Council to aid in the accomplishment of a work affecting so deeply the prosperity of the city and its inhabitants.

Whether the city, in its corporate capacity, possesses the legal right to make donations of land or money, in aid of this work, or to subscribe its funds to any portion of the stock of the Company, is not necessary now to inquire. It may be well, however, to state, that the municipal authorities of the city of Baltimore deemed it their duty to assist in the construction of the railroad from that city to the Ohio River, by a subscription of \$500,000 to the stock of the Company engaged in its construction. The city of Richmond, with a population of less than 20,000 inhabitants, has recently subscribed \$200,000 to the stock of the Company incorporated for the purpose of opening a communication by canals and railroads, between the Atlantic coast of Virginia and the river Ohio. The Union Canal Company of Pennsylvania has recently been aided by a loan of the credit of that State, authorized by its Legislature: and the Pottsville and Danville Railroad Company, incorporated for the purpose of directing to the city of Philadelphia the trade of the Susquehanna Valley, and avowedly claiming that they will be able through that channel to divert from the city of New-York a large part of the trade of the southern counties of this State, has recently obtained from the State of Pennsylvania a loan of its credit for \$300,000.

In the judgment of the committee, the aid to which the New-York and Erie Railroad Company are justly entitled from the public, ought to be rendered directly by the State. They therefore report, that it will not be expedient for the Common Council at present to aid in the enterprise, except by uniting strongly in the petitions to the Legislature, praying the State to co-operate in the efforts of the Company, and thereby signifying the unanimous sense which the municipal authorities of this city entertain of the public importance of the work.

The city, possessing one third of the taxable property of the State, is consequently interested to that extent in the pecuniary consequences of any subscription by the State at large; and will accordingly gain or lose to that extent, by the profit or loss to result from the investment in that mode of the public funds. The committee, however, do not believe that the State can sustain any pecuniary loss by such subscription, inasmuch as they deem it almost positively certain that the road, when completed, will produce an annual revenue fully equal to the interest on its cost.

The road will cost, when fully completed, much less than the Erie Canal, and in many respects will be far more useful to the public; and consequently will be capable of yielding a much greater revenue.

The fact that it will be open and available, and earning income, during the long interval of five months, in which the Erie Canal is closed; that it will afford facilities

ties for the expeditious transportation of passengers and the public mails, not possessed by the canals; that it will be connected by its lateral branches, and the numerous rivers and canals which it will intersect, with the most fertile and populous parts of the State, and with an extensive district in Pennsylvania and in New-York, abounding in natural resources, and capable of rapid advancement in population, prosperity, and wealth; and, above all, the fact that it will open the most direct and central avenue of trade and intercourse between the Atlantic seaboard and the immense and expanding communities adjacent to the great lakes and waters, and internal communications of the West, will assuredly justify the most confident expectation that the business of the road will yield an income fully equivalent to the interest on its cost, and the risk assumed in its construction; and that the public spirited individuals who may subscribe to the stock (including the State to the full extent to which it may participate) will advance their pecuniary interest, while at the same time they will promote to an incalculable extent the public good.

The Committee therefore beg leave to submit for adoption the following Resolutions:

Resolved, That the speedy construction of the New-York and Erie Railroad has become an object deeply interesting and important to the merchants, mechanics, traders, landholders, and all other inhabitants of this city—and that the efforts of the company who have been incorporated with the power to construct it, merit and ought to receive the zealous support and co-operation of the public authorities.

Resolved, That from the minute and personal examination of the concerns of that Company made by the Committee of the Boards of Aldermen and Assistant Aldermen, and the facts herein above set forth of the situation and prospects of the Company, there can be no reasonable doubt of their inclination and ability to complete the Road with all practicable dispatch, and that the whole can be completed within five years, in case the company shall be aided to a moderate extent by the patronage and co-operation of the state.

Resolved, That it is proper and expedient for the Common Council as representatives of the City and County of New-York, containing one-third of the aggregate amount of taxable property within this state, to petition the Legislature to invest a portion of the public funds in the stock of the Company, or else to facilitate its objects by a loan of the credit of the state, and therefore—

Resolved, That his Honor the Mayor be requested to transmit to the Legislature the petition of the City of New-York under its corporate seal, setting forth the necessity and advantages of this great work and soliciting the Legislature to aid in its speedy completion.

Resolved, That the public authorities of our sister City of Brooklyn, constituting a large and important portion of our commercial emporium, be, and they hereby are respectfully invited to co-operate with the Common Council of this city in such measures as may become necessary to promote the speedy accomplishment of the proposed road.

Resolved, That it be recommended to the citizens at large, assembled either in general meetings, or in their respective wards, to adopt energetic measures to ex-

press to the Legislature their sense of the transcendent importance of the proposed road, in preserving and extending their internal commerce with the west, and thereby augmenting the extent, population and prosperity of this metropolis.

Resolved, That in view of the importance of the proposed route in affording unrivalled facilities for the rapid transmission of commercial intelligence, it will be proper to petition to Congress, or the Post Master General of the United States to adopt such measures as may be necessary to secure the permanent use of the proposed road, for the carriage of the public mails, and that his Honor the Mayor be requested to transmit to Washington such memorial and petition in that respect as may be appropriate.

Resolved, That the members of Assembly, and of Congress from this city at Albany and at Washington, be, and they hereby are respectfully requested to use their best efforts in such mode as to them shall seem proper, to promote the success of the petitions thus to be presented by this city—and that they be furnished by the Mayor with copies of this report and the accompanying resolutions.

New-York, Feb. 4th, 1835.

#### ON THE COMPARATIVE VALUE OF FUEL.

(Continued from page 41.)

These kindling balls may be made so inflammable as to take fire in an instant, and with the smallest spark, by dipping them in a solution of nitre, and then drying them again; and they would neither be expensive nor liable to spoil by long keeping. Perhaps a quantity of pure charcoal, reduced to very fine powder, and mixed with the solution of nitre in which they are dipped, would render them still more inflammable.

[The foregoing meagre account of the relative value of several varieties of fuel, as determined by the heat produced in combustion, comprises about all the information which the labors of Crawford, Lavoisier, Rumford, Watt, Dalton, Clement, Desormes, and other philosophers, have shed upon the subject previous to the publication of Mr. Bull of Philadelphia, entitled "Experiments to Determine the Comparative Value of the Principal Varieties of Fuel used in the United States and in Europe," read before the American Philosophical Society of Philadelphia, in April, 1826. This is by far the most extended, systematic, and successful, effort yet made in this interesting field of experimental inquiry. I am indebted to the politeness of Mr. Bull for permission to transcribe the tabular results of his experiments, and such other portions of his interesting paper as more immediately comports with the practical character and design of this work; but would earnestly recommend the perusal of the whole paper to every scientific manufacturer, or artisan, whose processes involve any considerable consumption of fuel, as well as to enlightened readers of every class; for no subject is more generally interesting

in our cold climate than the most economical means of producing artificial heat.

The general principle on which Mr. Bull's experiments were conducted, for determining the comparative heat evolved in the combustion of the different varieties of fuel operated on, was to burn them in a close room, and note the time that the combustion of a given weight of each would sustain the air of the room at a temperature of 10° above the surrounding medium. To obviate the influence which the ordinary atmospheric changes of temperature and the winds would produce on the results, by furnishing a surrounding "refrigerating medium of inconstant power," the room in which the experiments were performed was surrounded by double walls, and the intermediate space sustained by artificial heat during the experiments, at a uniform temperature, and somewhat higher than the greatest natural temperature of the external atmosphere. The actual temperature of the inner and the outer rooms, during the experiment, was determined by common mercurial thermometers suspended in each, and the difference of temperature by Leslie's differential thermometer, the horizontal part of which traversed the inner wall, or partition, leaving a bulb and upright stem on each side. The combustion was effected in a small upright cylindrical stove furnished with forty-two feet of sheet iron pipe of two inches diameter, having in it several convolutions before it left the room. So completely was the heat generated in the process of combustion dissipated by the pipe, and emitted into the room, that a thermometer, the bulb of which was inserted in the pipe just before it entered the chimney, indicated the same temperature as the one which hung in the room. As the conducting power of air, in relation to caloric, is influenced by its hygrometric state, care was taken to preserve it in a uniform condition in this respect. All the varieties of fuel operated on were dried previous to combustion, at a temperature of 250°, Fahrenheit. Their solid contents were determined in the usual method for irregular bodies, by the volume of water which a given volume by the usual admeasurement displaces, and the specific gravities by the hydrostatic balance. In the latter case, porous substances, which expand by the absorption of water, as the wood, were previously covered with a varnish having exactly the same specific gravity as water; in short, no precaution seems to have been omitted by this laborious and able experimenter, to guard against every source of error, both in the construction of his apparatus, and in the general conduct of his inquiries. The annexed table exhibits the results of his experiments on sixty-six varieties of fuel.

On the first inspection of the annexed table I was surprised, as I presume others have been, at the general aspect of the 10th column in relation to the wood. The difference in the heat produced by the combustion of equal weights of dry woods is much less than I had apprehended, and such as to induce a momentary suspicion

bustion: assuming, therefore, the specific gravity of shell-bark hickory to be 1.000, and its value as 100, the value of the other woods must be in the compound ratio of their respective specific gravities, and the time which a given weight was found to sustain the required temperature, and is given in decimal expressions of this last number. On this subject Mr. Bull observes, "that although shell-bark hickory has been taken, for convenience, as the standard to construct the column of comparative values, the economist should take the cheapest article of fuel in the market, as his standard of comparison."

If we assume the average quantity of charcoal yielded by the dry woods to be 20 per cent. by weight, and the average time that a pound of dry wood sustained a temperature of 10° above the surrounding medium, in Mr. Bull's experiments, to be six hours (both of which terms are below the truth, but which sustain to each other about the ratio which we observe between the 5th and 10th columns in his table,) it results that just 50 per cent. of the heat emitted in the combustion of dry wood is to be attributed to the combustion of the carbon which it contains: for one pound of charcoal sustained the temperature of the room, at the required point, just two and a half times as long as the assumed average time that a pound of wood would do, which yields 20 per cent. of charcoal, and  $.20 \times 2.5 = .500$ .

The following remarks of Mr. Bull are full of interest to the economist of fuel. "From experiments made to ascertain the weight of moisture absorbed by the different woods, which had previously been made perfectly dry, and afterwards exposed in a room in which no fire was made during a period of twelve months, the average absorption by weight, for this period, was found to be 10 per cent. in forty-six different woods, and 8 per cent. in the driest states of the atmosphere; and an unexpected coincidence was found to exist in the weight absorbed by forty-six pieces of charcoal, made from the same kinds of wood, and similarly exposed, the latter being also 8 per cent."

"The quantity of moisture absorbed by the woods individually was not found to diminish with their increase in density; whilst it was found that the green woods in drying uniformly lost less in weight in proportion to their greater density. Hickory wood, taken green, and made absolutely dry, experienced a diminution, in its weight, of 37½ per cent., white oak 41 per cent., and soft maple 48 per cent. A cord of the latter will, therefore, weigh nearly twice as much when green as when dry."

"If we assume the mean quantity of moisture in the woods, when green, as 42 per cent., the great disadvantage of attempting to burn wood in this state must be obvious; as in every 100 pounds of this compound of wood and water, 42 pounds of aqueous matter must be expelled from the wood, and as the capacity of water for absorbing heat is nearly as 4 to 1 when compared with air, and probably

greater during its conversion into vapor, which must be effected before it can escape, the loss of heat must consequently be very great.

"The necessity of speaking thus theoretically, upon this point, is regretted; but it will be apparent that this question of loss cannot be solved by my apparatus, as the vapor would be condensed in the pipe of a stove, and the heat would thereby be imparted to the room, which, under ordinary circumstances, escapes into the chimney."

If we adopt the statement of Mr. Tredgold, that 8.40 pounds of Newcastle coal will convert one cubic foot, or 62½ pounds, of water, into steam, under common pressure of the atmosphere, which is probably correct, Mr. Bull's table furnishes the remaining necessary data for a more accurate determination of the loss sustained in burning green wood. Take, for example, 100 pounds of green white oak, which Mr. Bull found to contain 41 pounds of moisture: according to Mr. Tredgold, 41 pounds of water require 5.51 pounds of Newcastle coal for conversion into vapor. Now we have the relative values of oak wood and Newcastle coal, as it regards their power of producing heat, in the 10th column of Mr. Bull's table: 1 pound of white oak maintained 10° of heat in the room six hours and twenty minutes, and one pound of Newcastle coal nine hours and twenty minutes. We have then this proportion, as 380°: 560°:: 5.51: 8.12 pounds of dry oak, consumed in converting 41 pounds of water into steam; or, in other words, 13½ per cent. of the combustible matter of green oak is employed in boiling away its own water, and, in all ordinary cases, is a dead loss. It is true that arrangements might be made by a very protracted iron pipe, as in the stove used by Mr. Bull in his experiments, and other contrivances, for condensing the steam thus formed from green wood, and recovering both the latent and the sensible heat of the steam; but such an apparatus would be attended with too many inconveniences to be adopted in our dwelling houses, and would be perfectly impracticable in large fires in the arts, where the flue is necessarily kept at a temperature above boiling water, and where, of course, the steam could not condense.

In the foregoing estimate of the loss of heat by the combustion of green wood, I have considered the subject in a theoretical point of view; or, at least, only in relation to those operations which have for their object the diffusion of heat in the air of apartments. But in most of the arts the object is the reverse of this,—to produce a strong and circumscribed heat. In these cases there is not only an entire loss of that portion of caloric which escapes in the steam from most fuel, (for it cannot be recovered, even if subsequently condensed, to any efficient purpose,) but if the temperature fall, in consequence of this loss of caloric in the steam, below the required point, there must be a total loss of the whole fuel. I suspect that it would be quite impossible for our glass

manufacturers and iron founders to procure the intense heat required in their furnaces with the use of green wood. I have noticed at several glass-houses, and the practice is probably general, that the weather seasoned pine wood is dried, or rather baked, by a stove heat, at a temperature that not unfrequently ignites it before it is used. I think it not unlikely that this practice might, in many instances, be profitably extended to the ordinary fuel (pine wood) used for steam boilers in our river boats; or, in other words, that a portion of the fuel might be economically expended in drying the remainder preparatory to use. Mr. Bull estimates the average quantity of moisture, in woods which have been weather seasoned from eight to twelve months, at about 25 per cent. of their weight. It may be objected to this suggestion, that although stove-drying may be indispensable where the attainment of a certain high degree of heat is absolutely necessary to the success of the process, yet where this necessity does not exist, the water may be as cheaply dissipated by the absorption of the caloric in the ordinary combustion, as by burning a portion of the fuel separately for that object. To this it may be replied, that the effective heat imparted to steam boilers is not, as is generally supposed, in a direct ratio to the quantity of caloric emitted by the burning fuel, but more nearly in proportion to the elevation of the temperature in the fire-place above that of the water within the boiler. The vapor formed by a fire that shall only elevate the temperature of the water to within a few degrees of the boiling point, say to 200°, bears a very small proportion to that which is produced at 212°; so that it is quite easy to burn a considerable quantity of fuel under a boiler to almost no practical effect. To pursue this subject into the causes of these results would lead to a theoretical disquisition on the laws which govern the communication of heat, foreign to the object of this work.

The great superiority assigned by Mr. Bull to the Lehigh and other anthracite coals, not only over wood but the best English coals, has also excited some doubt, and particularly with us at the north, of the accuracy of the comparison; but this, it may reasonably be supposed, is attributable to a mistake, against which Mr. Bull has warned us in his treatise, that of comparing his results with common experience derived from the very imperfect arrangements for the consumption of this fuel, both in the arts and in our dwellings. Its introduction is of too recent a date to have diffused correct information on this subject, and doubtless we have yet much to learn as to the best methods of applying it to many purposes in the arts.

"The composition balls of Lehigh coal, charcoal, and fire clay," Mr. Bull observes, "were made for the purpose of ascertaining whether a very economical fuel might not be formed of the culm, or fine portions, of the two former, by combining them with the latter article, as they possess very little value: the same prac-

tice having been adopted with considerable advantage in various parts of Europe. The fire produced by these balls was found to be very clean and beautiful in its appearance. Its superior cleanliness is in consequence of the ashes being retained by the clay, and the balls were found to contain their original shape after they were deprived of the combustible materials. The beauty of the fire is enhanced by the shape and equality in the size of the balls, which during the combustion present uniform luminous faces. No difficulty was found in igniting, or perfectly consuming, the combustible materials, and the loss in heat, when compared with the combustion of the same quantity of each article in their usual states of aggregation, was found to be only three per cent." I think there must be an error, probably a typographical one, in carrying out the result of the combustion of this mixture in Mr. B.'s table: allowing the anthracite and charcoal to yield the same heat as assigned to them when burned separately in the aggregate form, they should have sustained the same temperature only ten hours and twenty minutes.]

*Bridge across the Hudson.*—At a highly respectable meeting held at Albany on Wednesday, Feb. 4th, a committee of 30 was appointed to draw up a petition to the Legislature on the subject of a bridge across the Hudson.

*FARMINGTON CANAL.*—The damages the Farmington Canal has sustained, in consequence of the late freshet are said to be very great. Those in the neighborhood of Westfield, Ma., are estimated from ten to fifteen thousand dollars.

By the annual report of the directors of the WELLAND CANAL, it appears that there have passed through the canal the last season, 570 schooners, 334 boats and scows, and 66 rafts, the amount of tonnage of which was 37,937. The tolls in 1832 amounted to £3,432; in 1833 to £3,618; in 1834, £4,300. The total amount of expenditure on the canal, including the year 1834, was £411,079 6 11 1.2 or nearly \$1,800,000.

The number of steamboats which passed through the Louisville and Portland Canal, during the year 1834, was 938; the number of keel and flat boats 623; the total tonnage was 162,000 tons, and the amount of tolls received thereon \$61,848 17.

*Steam Boat on Crooked Lake.*—We are happy to learn that a contract has been made for the building of a steam boat to run on this lake, and that it will be in operation by the first day of July next. The boat will play daily between Hammond's Port and Penn Yam—a distance of about 23 miles.—[Albany Argus.]

*Curious Historical Fact.*—The first rough model of a steamboat, made by Fulton, in this city, was cut out of a common shingle, shaped like a mackerel, with the paddles placed further before than behind, like the fins of a fish. The paddle wheel had been first put in the rear, on the sculling principle, but was abandoned on consulting with Mr. Greenwood, the well known ingenious dentist of this city, now deceased, in whose possession the model remained for many years. Old Admiral Landais, whom many of our readers recollect as the enemy of Paul Jones, was also in frequent consultation with Greenwood at the time. He recommended the paddle wheel to be placed in the stern, and to be moved by a tunnel shaped sail, that was to catch the wind even when it was directly ahead, and thus communicate the power by reaction to the wheel.—[N. York Star.]

## NEW-YORK AMERICAN.

FEBRUARY 7-12, 1835.

## LITERARY NOTICES.

WORKS OF MRS. SHERWOOD—Uniform Edition, Vol. VIII.: New York, HARPER & BROTHERS.—Another volume of this handsome republication. It contains a variety of stories—some short, others longer—all well told, and inculcating good lessons.

THE BOOK OF NATURE, by JOHN MASON GOOD, M. D., F. R. S., &c. &c.; 1 vol. 8vo: N. York, HARPER & BROTHERS.—We are glad to see this standard book—for as such, by universal consent it is, we believe, received—stereotyped and presented to the American public in so accurate a manner. Delivered originally in the form of lectures, which name, and corresponding division of subjects they yet retain, these essays embrace a systematic and popular survey of the most interesting features of the science of Nature. How great the range thus taken is, will be perceived by the mere mention of the three great heads under which the lectures are arranged.

*Series I*, treats of the nature of the material world, and the scale of organized and unorganized tribes that issue from it.

*Series II*, treats of the nature of the animate world, its peculiar powers and external relations, on the means of communicating ideas, and on the formation of society.

*Series III*, embraces the nature of the mind, its general faculties and furniture.

MECHANIC'S MAGAZINE, &c. &c.: vol. V. Nos. 1 and 2: N. York, D. K. MINOR.—The persevering proprietor, and now sole editor, of this periodical, goes ahead with unabated spirit; although, as we find by a notice in the number before us, his reward from adequate public patronage is yet prospective. Confident, however, that his work merits support, and strong in his reliance upon the intelligence as well as interest of Mechanics generally, not to let an undertaking fail, which is so especially devoted to their benefit, he looks back without regret, and forward without despondency.

FOREIGN CONSPIRACY AGAINST THE LIBERTIES OF THE UNITED STATES—1 vol. New York, LEAVITT, LORD & CO.—A series of numbers which appeared originally in a religious newspaper, the *New York Observer*, have been collected, revised, and with the addition of notes, are republished in a volume under the above title, by the author. The publication is sanctioned by a recommendation from four clergymen, of four different denominations, Episcopal, Presbyterian, Methodist, and Baptist.

The aim of the author is to show, that the Catholic religion has a *political* character, and that those who profess it are subject to *political* influence, adverse to the interests and liberties of America; that this character and this influence are actually arrayed under the control of European despotism and notably that of Austria, against the prosperity and progress of our free institutions; and that as Catholicism spreads in the land, the power of those who would, and can wield it to our political overthrow, is increased.

The author is represented as an American for some years resident on the continent of Europe, and whose attention was first aroused to the subject by what he there saw and heard; and whose

inquiries and observations in Italy, led him to the conclusion that danger existed to his own country, and that duty required him to point out that danger.

The cause, it will be admitted, is an important one. The motives of the writer are, upon this shewing, such as to entitle him to a willing hearing, at least; and the decision at which he arrives such as all Protestants and Patriots will unite in. This is, not that there should be persecution, illwill, or associations against Catholics—but that the Bible should be spread far and wide—religious instruction be made more universal—education generally be more extensively and more carefully disseminated—and, finally, free discussion.

We have said thus much of this little volume, because its title is one calculated to excite attention; and we desired, at once, to explain to our readers its meaning and tendency. We have as yet, however, only read a few of its pages, and reserve, therefore, for another day our opinion as to how the case is made out of "A Foreign Conspiracy against the Liberties of the United States."

LEAVES FROM MY LOG-BOOK: BY FLEXIBLE GRUMMET, P. M. 1 vol. Philadelphia: CAREY, LEA & BLANCHARD.—This is a collection of sea stories, published originally in an English periodical, and now gathered up in a volume. They are attractive, spirited, and, as we judge, full of good seamanship.

THE NORTH AMERICAN REVIEW; No. LXXVI.—Boston, CHARLES BOWEN.—We have read some of the articles in this number with much pleasure, and one—that on Mr. Jefferson—certainly without conviction, and we add not without regret. Of this however we may have more to say hereafter.

We make to-day another extract from the ingenious paper on poisoning. It refers to Leicester's arts.

The arts improve by time and practice, and under the reign of Elizabeth, that of secret poisoning was introduced from Italy, and flourished under the auspices of no less a personage, than the great Earl of Leicester, the most magnificent subject that ever adorned the British court. Among the persons attached to his household, was an Italian secretary, whom he had brought home from his travels, and was the reputed instrument with which he removed his victims. There is no great reason to doubt, that many of the tales which circulated about the secret practices of this arrogant favorite, were the product of envy and political hostility. They were so generally believed, however, that persons dying of a sudden death, were said to have gone off by Leicester's cold; and Camden who wrote his work, under the auspices of the Lord Treasurer Burleigh, gives no doubtful countenance to some of the most atrocious of the insinuations against Leicester. Among his earliest victims was his wife, the gentle Amy Robsart, immortalized by Sir Walter. He married this lady on the 4th of June, 1560; his sovereign, King Edward, was present at the nuptials; and from a passage in his journal, we obtain a knowledge of the somewhat singular bridal festivities of that day. June 4. 1560, Sir Robert Dudley, third son of the Earl of Warwick, married Sir John Robsart's daughter; after which marriage there were certain gentlemen, that did strive, who should first take away a goose's head, which was hanged alive on two cross posts. We commend this extract from the royal journal, to our brethren of the London Quarterly Review, who, a few years since, undertook to found a charge of heathenish barbarity, against the good people of the United States, in consequence of their indulgence, in some part, we forget where, of the western country, in this royal divertimento. After liv-

ing with him ten years, this poor lady disappeared, 'at a very unlucky juncture for the Earl's reputation; because the world at this time conceived it might be much for his convenience, to be without a wife, this island then holding two queens, young without husbands.' She was prevailed upon to visit Cumnor-house, the seat of Antony Foster, one of Leicester's creatures.—There the unfortunate lady became ill,—the consequence of the infernal practices upon her,—which however produced their effect too slowly to answer the desired end. She was importuned by Foster and his tool Varney, to take medicine for her disorder. They, seeing her sad and heavy, as one that knew by her other handling, that her death was not far off, began to persuade her, that her present disease was melancholy, and other humors, and would needs counsel her to take some potion. This she absolutely refusing to do (as suspecting the worst,) they sent a messenger for Dr. Rayly, professor of Physic, in Oxford University, and intreated him to persuade her to take some little potion, by his direction.—They would fetch the same at Oxford, *meaning to have added something of their own for her comfort*, as the doctor, upon just cause and consideration did suspect, seeing their great importunity and the small need the lady had of physic, and therefore he peremptorily denied their request. As well he might, for a part of this ingeniously contrived plan, was to mix a deadly poison with the medicine, which the doctor might prescribe, and thus throw upon him the responsibility of her death.—Her waitresses baffled the attempts at poison, and she perished by arts still more atrocious. The superb and remorseless hypocrite who caused her death, bestowed upon her the honors of a splendid funeral; but his own chaplain, in pronouncing her eulogium, stammering under the load of the dark and universal suspicion of foul play, twice in the course of his address, invoked the sympathy of the audience for the fate of the poor lady 'so sadly murdered.'

The next experiment of Leicester was upon Lord Sheffield, who suddenly died, and, as it was charitably rumored, of a Leicester cold. Leicester shortly after espoused the widow, and under the pretence that the Queen would be offended at the marriage, compelled her to keep it secret. After some time, the more effectually to conceal the connexion, he required her to marry Sir Edward Stafford. This she refused, till under the gentle discipline of Leicester, her hair fell off, and her nails dropped out, and she did what was demanded of her, to save her life.—These facts are certified by her own testimony on oath, and atrocious as they are, incredible as they seem, they are related by Sir Wm. Dugdale, and do not appear to be discredited by Camden.

The Earl of Essex went off in the same way, and for the same cause; but his countess happily survived this western Blue Beard. Besides his two first wives, and the husbands of the two last, there were others who were publicly said to have travelled the same road, by the same conveyance. The Cardinal Chastillon, ambassador from France, was poisoned at Canterbury, on his way homeward, and as was believed, by Leicester, out of revenge for the freedom which which the Cardinal had expostulated with Queen Elizabeth, on the arts with which Leicester defeated her marriage with a foreign prince. Sir Nicholas Throgmorton was seized with a mortal complaint at the Earl of Leicester's table, and died before he could be removed. Thus much appears by a letter of Leicester himself to Walsingham. That he perished, in consequence of poison given him in the salad, rests upon a tradition in the family, purporting to be founded on the dying asseveration of Sir Nicholas. The Earl of Essex, his great rival, was one of his reputed victims. On his death-bed, he gave this warning to his friends: 'I am passing into another world, and must now leave you to your fortunes, and beseech the Queen's grace and goodness, but beware of the gipsy, (Leicester,) for he will be too hard for you all. You know not the beast as well as I do.'—These dark imputations and many others of like import may be believed, when we reflect that Camden states positively, that Leicester proposed in council, that Mary, Queen of Scots, should be removed by poison. The biographer, who records all these facts, adds with commendable

simplicity, that "they must be exaggerated at least, if not false, since the earl at this juncture, (after Lord Shaftesbury's death,) obtained an act of parliament to enable him to erect a hospital at Warwick, which he afterwards did, and plentifully endowed it, that it might bear his name, and preserve his memory, as a most religious person,—the character which, of all others, he most affected,—to succeeding times?" Well done, candor!

## SUMMARY.

### Destruction of the Athenaeum, Baltimore.

This elegant building, we regret to state, was destroyed by fire on Sunday. When the alarm was first given, about an hour before noon, the fire was seen bursting through the windows of the third story near the western end. The flames soon rose to the fourth story and afterwards to the roof, and a strong wind from the north west carried them rapidly to the eastern and southern parts of the edifice. Large flakes of fire were wafted to the roofs of the adjacent houses, and in two or three cases had actually communicated to the shingles, but they were immediately discovered and extinguished.

The fire was happily confined to the premises in which it originated, but the devastation there was complete. From the roof down to the floors of the basement, the flames have devoured every thing combustible. The offices of the Attorneys in the basement and second stories were all cleared of their books, papers and other contents, before the fire reached them. Except the damages incident to so hasty a removal, it is believed that the gentlemen of the Bar have escaped without loss. In the third and fourth stories, however, the loss has been extensive and heavy.

In the fourth story were the rooms occupied by the Maryland Academy of Arts and Sciences. In these were arranged, in costly and elegant cases and fixtures, valuable and interesting cabinets of minerals, shells, insects, birds, and other specimens of Natural History—a collection of fifteen years' formation. There was also a Library of costly works, not so valuable for its extent as for its interest and fitness for the purposes for which it was established. Buffon's Natural History, in 100 volumes, was among them. Added to these was an extensive collection of phrenological casts, imported from Edinburgh, comprising the heads of several hundred celebrated individuals. We learn that the property of the Academy was insured, but the loss, in many respects, is one which money cannot easily replace.

The Baltimore Lyceum Library was in the 3d story. We are informed that this institution had recently purchased the collection of books which was formerly known as the Athenaeum Library. Here, we believe, there was nothing saved.

On the same floor were the Lecturing Hall and Library of the Maryland Institute, and a valuable philosophical apparatus—nothing of which was saved.

The Young Men's Society also occupied a room or two in the building, and it is said their loss in books is several hundred dollars.

The elegant Musical Saloon, so frequently used on public occasions, was the last of the upper rooms destroyed. The frame work which formed its arched and beautifully ornamented ceiling added, for a time, new vigor to the flames. The few movable articles it contained were saved, but there was no time afforded to take down an excellent organ belonging to Mr. R. Shaw, teacher of psalmody, and it was consequently involved in the general destruction. We learn that there is a policy of insurance on the organ for \$1000, which does not, however, cover its value.

The Athenaeum Building is insured in the Equitable Society's office for \$20,000, and we hear that there are policies for \$10,000 each, in two other offices.

DETROIT JANUARY, 22.—Postscript.—The bill authorizing the People of Michigan to form a State Government was passed by the Council this morning. It authorizes the election of delegates to take place on Saturday the 4th of April next, and the time for holding the Convention on the bill are retained. What say the freemen of Michigan to this!—[Journal.]

### Extract of a letter from an Officer in the Dragoons, dated

FORT LEAVENWORTH, JAN. 4, 1835.

I returned on New-Year's eve from a trip across the country to the Kansas Indians, about ninety miles west, having gone there for the purpose of paying them their annuity. I was absent eight days, and had to spend four nights in the woods—not a very pleasant thing at this season of the year. My duties as Paymaster to the Indians and Indian Agents, employ a large portion of my time, and require frequent absence from the post, having four agencies, and a number of tribes to pay, some of them above Council Bluffs. The Kansas are in nearly a wild state, living in lodges composed of dirt or buffalo skins, neatly formed, and the skins beautifully painted. In the same lodge you will frequently find an Indian, with his three wives, and eight or ten children, living in the most perfect harmony. After getting through my business in the day, I generally spent the evening in their lodges, although it was sometimes a severe task, as the fire, which is built in the middle of the floor, would make so great a smoke, that it was almost impossible to breathe. The Indians, being accustomed to it, did not mind it, and I would cross my legs before the fire, on the ground, and stand it as long as I could. In order to have a little sport, I put up a red blanket for the squaws to run for: about a dozen started, stripped, except a piece of cloth around their bodies. The race (about four hundred yards) was well contested, and the winner was carried off in exultation by her band. I made myself quite popular with them, by carrying a paper of red paint in my pocket, and painting a number after their fashion, both their hair and face; and I can assure you it had not a bad effect. I have a pipe and tobacco pouch, which was presented to me by one of the prettiest girls I saw among them. She was about fifteen, and a widow, her husband, the son of the head Chief, having died two years before—the time they wear mourning, or rather, go in sackcloth and ashes, wearing the oldest skins during the whole time, and every morning putting a parcel of ashes on their hair; and as long as the ashes remain on, they cannot either eat or drink, without water is brought by some of their friends to wash it off; and every night and morning they cry most bitterly for about a quarter of an hour. The first morning after we got there, we were awoke by three of the wives of the Chief that had been killed a short time before, crying most hideously by our tent; and there they continued until something was given them, and they then went off. The time of mourning of the young widow being out, her father brought her up, dressed in their richest fashion, in scarlet, and painted, to shake hands with their father, as Major Cummins, the Agent, is called, and the Great White Chief, (myself.) She looked so pretty that I gave her a scarlet blanket, and she, in return, gave me a pipe and pouch—(the pouch is the skin of a skunk.) I told her that I should keep it, and carry it on to my friends that lived three moons (months) travel from there, and that I would tell them that it was given to me by the prettiest girl in the nation, and the daughter of one of their greatest Braves, &c. at which she seemed much pleased.

RAILROAD ACCIDENT.—On Sunday, the 25th ult. a serious accident occurred on the Lexington and Ohio Railroad, near Lexington. The locomotive was propelling instead of dragging, two burden cars and a passenger car of unequal height. The burden cars were filled with people, and no railing around the platform on which they stood to prevent their falling off. In passing a curve, the projecting end of one of the burden cars passed above, instead of meeting plump, the corresponding projection of the next car, and was thereby raised up and thrown off the rail.

The sudden jerk and change of direction, caused a considerable shock and great alarm: some of the passengers on the burden cars attempted to jump off—Those standing on the forward burden car, were, of course, most sensibly affected, having no safe guards; some were thrown backwards and knocked off those

standing near the side, under the wheels of the succeeding car and tender. But for a sloping bank at the point where the accident occurred, most probably, no serious accident would have been the consequence, for all seemed to clear the rails in jumping or falling off.—Lewis Leonard of Lexington, reached the bank, and fell or rolled back under the hind wheel of the near car, which passed over and killed him: his body impeding the front wheel of the tender, and thus, with the instant action of the admirable engineer, preventing the loss of several lives.—The engineer stopped the moment he saw the accident—quicker than a carriage, with horses, could have been halted.—Leonard Taylor, of Lexington, and Daniel Green of Fayette, had each a leg broken.—Alexander Shidel and Samuel Long, Sen. of Lexington, Wm. A. Cocks and Joseph Holt of Louisville, and P. W. Turp-nall of Springfield, were all thrown or knocked under the car by the sudden shock or by the multitude jumping out, and severely bruised.

Mr. Cocks's escape with life was remarkable. In attempting, with his feet, to push himself from the car after he had fallen, the forward wheel of the rear burden car caught his left foot and held it so fast, that it was necessary to cut off his boot and take that side of the car to pieces, before he could be released—another move of the wheel would have been fatal; as it was, his foot was very severely torn.—The presence of mind and promptitude of the Engineer saved him.—[Lexington Journal.]

HOLLAND LAND COMPANY CAUSES.—Another of these causes (against Daniel Kemp) came on to trial in the district court of the United States before Judge Conkling, on Tuesday, the 27th ult. and continued from that time until yesterday, when a verdict was rendered for the plaintiffs.—In this case, we learn that the plaintiffs deduced a title to the lands claimed by them from the State of New York to the State of Massachusetts, and from the latter to Robert Morris. They then relied on a Sheriff's sale under a judgment and execution against Robert Morris, through which the title was transmitted to them. In the course of the trial, the nature of the Indian right came under discussion, and the plaintiffs contended that it was a mere right of occupancy, personal to the Indians, which could not be transmitted, and which could not be set up in bar of an action of ejectment brought by a person having the title of the soil; that it was to be deemed extinguished, from the fact that the country was and for many years had been occupied by the whites: and the plaintiffs also gave in evidence a treaty held with the Senecas in 1797, by which their right to the premises had been extinguished. Numerous exceptions were taken by the defendant's counsel to the decision of the court in the various questions presented. The case was conducted by John C. Spencer and Daniel Cady, Esqrs. for the plaintiffs, and by Joshua A. Spencer and Samuel Stevens, Esqrs. for the defendant.

We learn that a third cause (against Sympster Lock) was commenced yesterday, and that in this the plaintiffs counsel have gone into another chain of title directly from Robert Morris.—[Albany Argus.]

An aged Blanket.—The Boston Transcript says, a boy about six months old, was carried to church to be baptized, the other day, wrapped in a blanket which once belonged to the family of the Cottons; and was brought by John Cotton, from England to this place 199 years ago. The material of which it is formed, appears to be the kind sometimes called cotton flannel, but the cotton furz, or nap, is nearly worn off. The body of the cloth is still tolerably good, and may last with care another century.

Buying a Hat.—"Misther, have ye ever a palm leaf hat?" Yes, sir. "I wad be aither purchasing one, and what will you ax? Nine shillings." "Nine shillings! but that beats the devil intirely I could buy the same for four and sixpence a while since!" Oh well, wait a while till summer is over and you may have this for that price. "True for ye, and what'll cover the head of me the while?" O, by the powers, I'll fix it so that nather of us will be cheated.—I'll take the hat now and pay when the price is down."

**ACCIDENTS ON THE ROAD.**—Mr. Bullard, a much esteemed merchant of Boston, was returning from Ipswich to Boston on the 3d instant in the stage, when it was upset by the driver's running against a wagon. Mr. B., who was on the coachman's seat, was thrown with violence to the ground: the stage fell on him, broke his collar bone, ribs, and otherwise so seriously injured him, that he survived but a few hours. His wife was inside the stage, and escaped uninjured.

On the 4th instant, the stage to Albany on the west side of the River, was upset near Newburg, and Mr. E. Tibbets of this city, a passenger, had two ribs broken.

**Whales in the Sound.**—Capt Marther of the revenue cutter Wolcott, saw a few days since, two large whales in the vicinity of New London light house and Fisher's Island.

**SAILORS' SNUG HARBOR.**—The annual report of the Trustees of the Sailors' Snug Harbor, was made to the Senate yesterday.

The receipts for the year, from rents, dividends and various other sources, were \$34,744.65  
Cash on hand, 31st Dec, 1833, 2,011.96

\$36,756.61  
Disbursements, including \$1,477.49 for erecting a monument to the memory of Mr. Randall, \$33,568.98  
Cash on hand, 31st Dec. 1834, 3,187.63

\$36,756.61  
The vested funds of the institution at par value, the cash on hand, and the outstanding rents and interest, amount to \$103,754.38. The income for 1835, is estimated at \$29,519.74. The President states, that "there are now in the Snug Harbor fifty-four aged and disabled seamen, who are entitled to support under the provisions of Mr. Randall's Will, and the doors are open for farther applicants. These aged men are plentifully fed, comfortably clothed, and supplied with every thing requisite to soothe their declining years."—[Albany Argus.]

**Inspection of Tobacco.**—The first annual report under the law providing for the inspection of leaf tobacco, in the city of New York, was made to the Senate yesterday, by James D. Stevenson, inspector.

The following is the amount inspected from 22d April (the day the law took effect) to the 31st December:

Hhds. tobacco.	Weights.	Probable value.
5791 merch'ble	7,702,030 at 7cts.	\$539,142.10
118 unmerch.	159,433 5	7,971.65
<b>5909</b>	<b>7,861,463</b>	<b>\$547,113.75</b>

Amount of fees for inspection, \$11,818.00  
For storage, 1,556.00

\$13,374.00  
Expenses, officers, deputies, coop-  
era, &c., 11,958.00

\$1,416.00

Appended to the report are a number of letters, from importers and growers of the article, many of whom (the inspector states) opposed the passage of the law, expressing a decided conviction of its beneficial operation. Of the tobacco inspected, 3657 hhds. were the growth of Kentucky, 1754 of Virginia, 413 of Ohio, and 85 of Maryland.—[Albany Argus.]

Henry A. S. Dearborn has been appointed Adjutant General of Massachusetts, and entered upon the duties of his office.

**An honorable Anecdote of Erskine, the eminent lawyer.**—A poor man, in a distant part of Scotland, who wished to obtain redress for a wrong done to him by a wealthy neighbor, being cautioned against contending for his right in such a case, gave his friendly adviser this answer: "Ye dinna ken what ye say, Maister; there's nae pair man in Scotland need to want a friend, or fear an enemy, while Harry Erskine liess!"

**Sudden Death.**—The Rev. Joseph Sanford died in his pew in the Methodist Church in Green street, a few minutes after taking his seat on Sunday morning. He walked to the Church in company with his wife, to whom he had been married but two weeks, from his residence in Mulberry near Bleecker street, and while on the way complained of some slight indisposition.—He was noticed in a kneeling posture in his pew, and after a supplication to his God, rose and fell back lifeless on his seat.

**Propensity of Birds.**—At the recent fire in Spring street a covey of pigeons was observed hovering over the flames at a great height, presenting a beautiful appearance, resembling that of gold, caused by the reflection of the light below. For several minutes they were seen darting in every direction, as if at a loss where to wend their passage. At last they were noticed to follow the propensity ascribed to birds by naturalists, and plunged one by one into the flames, where they perished.—[Com. Adv.]

**Feather Dressing.**—Mr. Philip Wilcox has now in use at his shop a very simple apparatus for cleansing and restoring life to feathers, by means of heat and action in a large revolving cylinder over a coal fire. The feathers are thus purified from all dampness, perspiration and noisome effluvia collected in use, and restored to their original life. Mr. George Reynolds of East Hartford is the inventor. Mr. Wilcox has the last week, dressed twenty or more beds for different families in this town, and the improvement has surprised them.

So says the Litchfield (Ct.) paper; but what sort of life is restored by this process?

**Capture of a Slave.**—The British brig of war Cruiser arrived at Havana on the 18th ult. with a schooner which she had captured, having on board 340 slaves. Four vessels had recently arrived there and landed their cargoes, consisting of 2300 slaves.

**Education in Russia.**—The whole number of pupils of schools in Russia, is 65,589, out of a population of fifty six millions. Is. two to every 1,465 inhabitants!

**Principles and Practice.**—"Give me," said an infidel, to a distinguished French divine, "your principles, and I will be a better man than yourself."

"Begin," replied the believer, with being a better man, and you will soon have my principles. The promise of our gracious Redeemer harmonizes with this sentiment: "If any man will do his will, he shall know of the doctrine whether it be of God."

**ALABAMA.**—The Legislature of this State adjourned on the 10th ult:

Among the acts passed (217 in number!) was one prohibiting the circulation of any bank notes under five dollars, of banks out of the State.

Eleven bills of divorce were granted by this Legislature.

We have recently seen an estimate in the papers, that the number of divorces granted annually in the United States is near two thousand!

What a state of morals does such a fact—if true or approaching to truth—imply?

It becomes our melancholy duty to announce the death of another aged, patriotic and universally esteemed citizen, William Patterson, Esq. He departed this life on Saturday last, in the eighty-third year of his age.—[Balt. Amer.]

**MILITIA APPOINTMENTS.**—By the Governor and Senate of New York.

**Montgomery.**—Benedit Arnold, major general of 2d division of cavalry.

**Niagara.**—Edward Cole, major general of 4th division of artillery.

**Westchester.**—Aaron Ward major general of 4th division of infantry.

**New York.**—Ebenezer Irving, major general of 28th division of infantry.

**Jefferson.**—John W. Edwards, brigade inspector of 4th brigade of infantry.

**Commendable Enterprise.**—We learn from the Philadelphia Inquirer that the sum of fifty thousand dollars has been subscribed for the purpose of establishing a line of steamboats to tow vessels up and down the Delaware. It is a commendable enterprise, and one that will be of great advantage to the commerce of Philadelphia.

**AMERICAN QUARTERLY REVIEW.**—We have before stated that Mr. Robert Walsh with his son as associate, has become the proprietor of this periodical. We may now add that Mr. Martineau Towsky is in this city with a view to obtain subscribers for the new series commencing on 1st proximo. We cordially commend this Review to the patronage of our citizens.

It appears by the annual address of the Mayor of Boston, that the city debt on the 1st Jan. was \$1,265,164, the whole of which, except \$100,000 had been created since the city was incorporated. The annual taxation is \$9 40 on \$1000. The city (says the N. Y. Star,) maintains 72 primary schools, having 4,014 pupils between four and seven years of age; ten grammar, one Latin, and one English High school—in all of which are 4,009 pupils, chiefly from seven to fifteen years of age. Thus the city educates 8,423 children at a cost annually of \$8 each child, exclusive of interest on the buildings. The number of pupils in private schools is about 4,500, which is a total of 12,923 pupils in a population of 70,000. The city owns 20 engines, 25 hose, 4 bucket, and 3 hook and ladder companies, making in all 1,257 members, the expenses of which are \$16,000.—The annual amount of property destroyed by fire the last three years is \$63,000. The fire department is very efficient.

A bill is before the Legislature of New Jersey, to incorporate a Life Insurance and Trust Company, with a capital of 1,000,000 of dollars, to be located at Hoboken! The bill is modelled after the New York Life Insurance and Trust Company's Charter, which gives pretty ample powers and privileges.

**Divorces in New Jersey.**—Matrimony appears really upon the eve of "breaking up house keeping" in New Jersey. The number of applications for divorces to the Legislature now in session, has been beyond all former example. Three petitions were presented in one day, during the last week. We are afraid that bad husbands or bad wives are more plentiful in New Jersey, than they should be.

**Inducement to Matrimony.**—A Texas letter writer states that the tide of emigration to that country from the United States is very great.—Nor can this be a matter of surprise, when it is added that the Mexican government assigns to each settler, if married, a league square, 4446 acres, of land as a bounty. If the emigrant be a single man when he arrives, he gets only 1110 acres—but if he gets married afterwards, he receives the very pretty dowry, not from his bride, but from the Government, of 3336 acres more!—[Com. Adv.]

**A laughable adventure.**—Not long since, a reverend clergyman in New Hampshire, being apprehensive that the accumulated weight of snow upon the roof of his barn might do some damage, resolved to shovel it off. He therefore ascended it, but having first, for fear the snow might all slide off at once, himself with it, fastened to his waist one end of a rope, and giving the other to his wife, he went to work; but fearing still for his safety, "My dear," said he, "tie the rope round your waist." No sooner had she done this, than off went the snow, poor minister and all, and up went his wife. Thus on one side of the barn the astounded and confounded clergyman hung, and on the other side hung his wife, high and dry, in majesty sublime, dinging and dangling at the end of the rope. At that moment, however, a gentleman luckily passing by, delivered them from their perilous situation.

**PREPARATION AND PRECAUTION.**—The Baltimore American of yesterday publishes the annexed extract of a letter from Washington:

"Our squadron in the Mediterranean is ordered to Gibraltar, to prevent sequestration in a French port, or blockade in a Spanish. Commodore Elliot hoists his broad pendant on the Constitution, and proceeds from New York to the Mediterranean. Captain Kennedy is to command the Peacock and Boxer, and proceed to the Chinese seas, for the protection of our commerce in that quarter, and the whole naval establishment is to be put on a war footing."

**COMMERCE WITH FRANCE.**—It is wise to look before we leap, to count the cost of a war before we rush into it. A communication we publish from the Journal of Commerce, will assist our readers in the last process. A letter from the Baltimore American, of which we also insert an extract, seems to look, if authentic, as though our Government apprehended that France might take the initiative of hostilities.

We do not ourselves think this probable, but if she should, it would overwhelm the commerce, and especially the Insurance Companies of this country with ruin. One single company, for instance, in this city, has insurance on property amount to the amount of *twenty millions of dollars*; two thirds of which, at least, would, in the event of instant hostilities, be captured or destroyed.

Let us then pause and prepare—let us not act rashly, to repent at leisure.

[From the Journal of Commerce.]

Our Trade with France.

In order to form a correct notion of our affairs with France, the following statements, taken from the Treasury Report, will serve for a guide:

	Imports.	Cotton exported.
1829	\$9,617,000	\$6,500,000
1830	8,340,000	7,650,000
1831	14,720,000	4,300,000
1832	12,753,000	7,753,000
1833	12,303,000	8,900,000

It will be perceived that the imports are rapidly increasing, being in 1833 about 45 per cent. above the amount of 1829. The average of imports for the last 5 years is about 12 millions.—The export of Cotton has augmented about 30 per cent. within the 5 years ending 1833, and that for 1834 will be much larger than that of the preceding year. The average export of this article, for the 5 years ending 1833 is about 7 millions of dollars. The amount of exports (beyond the cotton) necessary to pay the balance due for the imports, is made up of Rice, Tobacco, Ashes, with some foreign articles, and occasionally Specie is shipped, as in 1829, when 1.34 million dollars, and in 1831 when 3 million dollars were sent. Taking one year with another, 7.8 of our exports to France are of the products of our soil, carried chiefly in American vessels, giving freight and employment to about 130,000 tons of American shipping. Since the reduction of duty, French tonnage entering our ports has increased, and it now stands to the American from France, as one to five.

The following statement will show the leading articles which form our imports from France:

	Silks.	Wool.	Wine & Brandy.	Other.
1829	\$4,285,000	540,000	500,000	1,000,000
1830	3,255,000	485,000	650,000	910,000
1831	7,100,000	1,200,000	1,545,000	914,000
1832	5,000,000	775,000	1,320,000	1,530,000
1833	6,400,000	914,000	1,023,000	1,800,000

The above exhibits a great increase for the last 5 years, and there is reason to expect that if the trade suffers no extraordinary interruption, it will go on augmenting in quite as great a ratio. Silks, which make so large a portion of the imports, are well adapted to our wants, and are become so common an article of clothing, that we are not likely to do without them, even if we have to seek them through indirect channels. The Import of Woollen and Cotton manufactures is destined to be enlarged in proportion as by the existing law our Tariff becomes re-

duced, and although Brandy may be lessened in demand from local causes, yet for the same reason the use of Wine will much increase. It may be too worth considering whether the health and morals of the people are not improved by the use of a wholesome beverage such as mild wines offer, rather than ardent spirits, and whether in any event, the Government would not show wisdom in keeping down the duty on wines for the purpose of a more extensive consumption.

Notwithstanding the duty is still high on manufactures of leather, it will be seen that the importation has kept pace with those articles on which the duty is repealed,—a proof that they are necessary, and we can obtain them from no other source at so cheap a rate. In short, our whole trade is in a flourishing state. The importation of silk and leather manufactures has increased 50 per cent. in five years, while that of woollen and cotton manufactures has nearly doubled within the same period, and there is good reason to expect a further extension in the ratio of our increasing population. Of the whole imports, less than 10 per cent. (as near as can be ascertained,) only is re-exported to the West India and Mexican markets,—which clearly shows, by so large a portion of consumption, that the goods are suited to our wants, and that we cannot supply ourselves with them elsewhere.

The French themselves attach much value to the intercourse with this country, and view with satisfaction the interchange of articles the manufactures and products of the soil of each nation, and which each derives benefit in exporting to the other. But according to data furnished by the French journals, it is apparent they overrate the amount of the trade.

In the debate in the French Chamber of Deputies, April 1834, on the question of the indemnity bill, the Minister of Commerce, Mr. Duchatel, states the exports to the United States as follows:—

	fr. 65 millions.	\$12 millions.
1829	69	13
1830	110	20 1/2
1831	22 (Cholera)	24
1832	106	20

These accounts are from January to December of each year. Besides the disagreement between the French statement and our own for each year, there is a general irregularity in the sums as compared with ours, which is altogether unaccountable. The whole is greatly exaggerated, possibly for effect, the Minister being desirous to impress on the Deputies the loss the nation would sustain by an interruption to the trade, which might arise in consequence of their refusing to pass the bill. The loose and inexact manner the exports are estimated in France, is a cause why no dependence can be placed on the above statement. The method of ascertaining the amount of exports of dry goods, is by weighing them and fixing a rate of export duty per kilo-gramme, which rate has been established many years, without reference to the cost of manufacture. Thus a piece of silk which cost 4f. the ell, will pay the same duty as one which cost 2f. the ell, at the same time the dearer may weigh less than the cheaper piece.

Our statements derived from the Treasury Reports are plain facts, which shew that the trade is advantageous, has been on the increase for several years, and will become still more extensive if the harmony now existing between the two countries be maintained.

"We understand," says the Globe of yesterday, "that information has reached the War Department, stating that several rencounters have taken place between some of the citizens of Georgia and parties of the Creek Indians who crossed from Alabama into that State, and committed many depredations. Persons have been killed and wounded on both sides, and the inhabitants seem much alarmed at the conduct and threats of the Indians, and have called upon the Governor of Georgia for a militia force to protect them—and the Governor has requested the interposition of the President to relieve the citizens of Georgia from this state of things."

**Great age.**—Jennings Allen, a soldier of the revolutionary war, died lately in Fairfield Dis-

trict, S. C. at the age of one hundred and four teen years.

**STRAWBERRIES—EXPENSIVE BREAKFAST.**—

Under date of May 29, 1783, we find this paragraph in one of Miss H. More's letters:

"Did I tell you that the Bishop of Chester's Sermons were out of print in eight days. I hope the age is not so bad as we took it to be; and yet it cannot be very good, when the strawberries at Lady Stormont's breakfast, last Saturday morning, cost one hundred and fifty pounds."

This sum is equal to about \$700, which will support a whole family a year, or buy land enough for a farm.

**MANUAL LABOR AND MENTAL CULTIVATION.**—"My conviction—not lightly taken up, but the result of long and earnest thought—is, that daily occupation with manual labor is in no way incompatible with the highest mental cultivation and refinement; that so far from the exercise of mechanical employment daily, for a moderate time, being detrimental to the mental powers, it has, on the contrary, a decided tendency to strengthen them; and that if those who at present serve the public in the capacity of writers, were to employ several hours a day in mechanical labor, their bodily health would be improved, and their writings would take a character of vigor, startling even to themselves. They would find the workshop a more healthy atmosphere than the drawing room. There is no reason, save ignorance, why any thing like degradation should attach to the character of the working mechanics. There is no reason, save ignorance, why they should not have dwellings as good as their employers, as to all the purposes of comfort. There is no reason, save ignorance, why they should not have refreshing baths, after their daily toil, and abundant change of comely garments conducive to health. There is no reason, save ignorance, why they should not have abundance of good and well-prepared food for the body, and access to books of all kinds for the proper culture of the mind. There is no reason, save ignorance, why they should not have access to theatres, and operas, and lectures of all kinds, and picture and sculpture galleries, and museums, far more imposing than any thing the world has yet beheld. There is no reason, save ignorance, why the great body of the working people should not possess, in addition to all that is necessary for the comfortable maintenance of the body, all the pleasures of mental refinement, which are now only within the grasp of the very rich. There is no reason, save ignorance, why the ruling power of the state should not be in their own hands, and all else, save only the excitements of ostentation and expensive sensuality."—[Tait's Magazine.]

There is much truth and good sense in the preceding paragraph—enough, indeed, to secure comfort, intelligence, and happiness, to thousands, if they will believe, and will it.

The venerable M. D'Ornay, member of the Academy of Sciences of Rouen, died recently at Paris, aged upwards of 100.

**A Legend of Nummernips,  
(A VERY CELEBRATED GERMAN FAIRY.)  
Translated from the German.**

One day as Nummernips was sunning himself in the corner of his old garden, which was now like any other part of the Harz mountain, there came trotting gaily along a woman who attracted his attention. She had one child in her arms, she carried one on her back, she led one by the hand, and a somewhat larger boy bore along a heavy basket, which was to be filled with greens for the cow. A mother, thought Nummernips, is a good creature to be sure, she drags on her four children, waits upon them without a murmur, even if she has the weight of the basket beside her. These thoughts made him wish to have some talk with the good woman. She set the children down on the grass and stripped some leaves from the bushes. In a little while the baby began to grow tired and to cry. The mother left off her work, played and frolicked with the children, took the little one up, jumped about and sang to it, at last rocked it to sleep in her arms and returned to her work. Soon the flies bit the little sleeper and he began to mope again; but the mother did not grow impatient; she went into the woods and picked strawberries and raspberries, and put the smallest child to her breast. This motherly management pleased Nummernips much, but the little crier, who had ridden on his mother's back, would not be contented, he was a naughty, violent boy, threw away the berries that his kind mother offered him, and then cried for them to eat. At last she grew impatient, and called out, come Nummernips and take away this screamer. Immediately Nummernips took the figure of a coal-man, stepped up to the woman and said—Here I am, what would you have? The woman was very much frightened at this sudden appearance, but she was a brave hearted woman, and soon gathered courage. I called you just now, said she, to still the children, but as they are now quiet I do not need you, though I am much obliged to you for your kindness. Do you know, said the old fellow, that people do not call me here unpunished? I held you to your word, give me the screamer that I may eat him, I have not met with so nice a bit for a long time. As he said this, he stretched out his hand to take the boy.

As a hen, when she sees a hawk hovering high in the air, or the wicked wolf creeping into the yard, first calls her chicks into the secure hen coop, then ruffles her feathers, spreads out her wings and begins with her strong foe, an unequal contest, so did the woman seize the black coal-man fiercely by the beard, doubled her fist, and cried out, monster, you must first tear my motherly heart from my body before you take away my child. Nummernips had not expected so violent an attack; he stepped back, having never before felt the strong gripe of a human hand. He smiled kindly on the woman; do not disturb yourself, said he, I am no flesh eater, as you suppose, and will do you and your children no harm, but let me have the boy, I like his look, I will bring him up for my own, I will clothe him in satin and silk, make a brave knight of him, and he shall grow up a brave knight, who one of these days will support his father and brothers. If you ask a hundred crowns for him I will pay you now.

Ha, ha, laughed the woman, you like the boy, do you, he is one of a thousand, that I would not sell for all the treasures in the world.

You fool, answered Nummernips, have you not besides three children who give you trouble and pain, whom you can hardly feed, and who plague you day and night?

Woman—Oh well I am a mother, and must follow my calling, children give pain, but they also give pleasure.

Nummernips—Fine pleasure to bear with their bawling, to drag them and feed them.

Woman—In truth, sir, you do not know a mother's joys, all her labor and fatigue is sweetened by one friendly look, the pretty smiles and lipings of the little innocent creatures. If I look only at the little gold headed fellow as he hangs

on me, the little flatterer, he is not crying now you see. Oh, if I had a hundred hands I would lift and carry any thing in working for you, dear little creatures.

Nummernips—But has your husband no hands to work?

Woman—Oh, indeed he has, I feel them some times.

Nummernips—What, does your husband dare to raise his hands, and against such a wife? I will break him of that trick, the murderer.

Woman—(laughing)—You will have a great many necks to break, if you break the necks of all the husbands who abuse their wives—they are a poor race, and those who wed, take sorrow to bed—but it must be borne, for why was I married.

Nummernips—If indeed you knew that the men were a bad race, you were much to blame when you married.

Woman—May be so, but Stephen was a brave lad, who had a good trade, and I was a poor girl without a dowry. He came to me, and asked me to marry him, gave me a wild man's dollar, and the bargain was made. He afterwards took the dollar away from me, but I have the wild man still.

Nummernips—Perhaps you have made him wild by your obstinacy.

Woman—Oh he has driven that all out of me, I assure you. He is a violent fellow. If I behaved like an angel he would be more furious in the house than you good Nummernips are in the mountain, and then he tells me of my poverty and that stops my tongue. If I had brought with me a portion, I would stand my ground better with him I assure you.

Nummernips—What is your husband's trade?

Woman—He is a glass trader. His calling makes him cross, sometimes. The poor fellow bears his heavy loads from Bohemia, year out and year in. If he breaks a glass on the way I and the poor young ones must suffer, but love blows do no great damage.

Nummernips—But can you love your husband when he abuses you so?

Woman—Why not? Indeed, is he not my children's father. That makes up for all, and they will pay for all our troubles when they grow up.

Nummernips—Poor comfort, children reward their parents with trouble and care indeed! The last drop of comfort will be drained from your cup, when the Emperor sends them far away in his army to be killed by the Turks.

Woman—Oh fie! that does not trouble me:—if they die, 'tis for their Emperor and country, in their proper calling. But if they live, they get booty and gladden their parents' hearts.

Upon this, Nummernips began again to traffic for the boy; but she gave him no answer, crowded the leaves into her basket, tied the little screamer fast to her belt, and Nummernips turned as if he was going to leave her, but as her load was very heavy, she called him back and said, I have called you once before, help me up, and if you would do me any farther kindness, give the boy who pleases you so much a Good Friday penny to buy him a couple of biscuits.—To-morrow the father comes home, and will bring us some white bread from Bohemia. I will help you up, said Nummernips, but if you will not give me the boy, you shall have no penny.—Very well, said the woman, and went her way.

The farther she went, the heavier grew her basket, and every ten steps she had to take breath. She thought something was out of the way, and that perhaps Nummernips had played her a trick, and hid a heavy stone among her leaves. So she put her basket down on the next fence and emptied it. But there fell out leaves only and no stone. Then she filled it half up, and put as many leaves in her apron as it would hold, but soon it grew too heavy again, and she was obliged to throw away some more, which made the stout woman wonder greatly, for she had often carried home much larger quantities of grass, and never felt such fatigue. Nevertheless she set her household in order when she got home, threw the leaves to the goat and little kid, gave her children their supper, put them to sleep, said her evening prayers, and quickly and gaily sunk herself to slumber.

The first red of the morning, and the waking baby, who called for his breakfast with a loud voice, disturbed the healthy slumbers of the busy wife and called her to her daily labor. She went first, according to her custom, with her milk pail to the goat's stall—What a dreadful sight. The good old goat, who nourished the family with milk, lay there stiff and cold, her feet stretched out, already dead, but the kid was rolling its eyes in its head, stretched out its tongue, and shewed by many signs that it was near dying. Such a misfortune had never happened to the good woman since she had been a housekeeper; struck dumb with fear, she sunk down on a bundle of straw, put her apron before her eyes, that she need not see the pain of the dying kid, and sighed deeply. Unhappy woman, thought she, and where will my rude husband begin when he comes home; the blessing of God in this world is gone from me. In a moment she drove this thought from her mind—If the dear goat was thy only blessing from God what is thy Stephen, and what are thy children? She was ashamed that she had been so hasty.—Let all the wealth in the world go, said she, I have my husband and my four children.—The fountain of milk for my nursing is not dried up, and there is water in the well for the rest.—And if Stephen is angry and treats me ill, it is no matter, I shall lose nothing by it. The harvest is near at hand, I can go and reap, and in winter I will spin till late midnight,—so I shall be able to buy another goat, and if I get her, I shall have the kid without doubt.

As she thought thus, she dried up her tears, gained her courage, and as she raised her eyes she saw lying at her feet a leaf which shone as bright and yellow as gold. Quickly she sprang up, ran with it to her neighbor, the Jew's wife, showed her what she had found, with great joy. The Jewess owned it to be pure gold, took the usury and paid her for it two thick dollars down upon the table. Every heart's sorrow was now forgotten. Such a treasure in money the poor woman had never before had in hand. She ran to the baker and bought bread and butter and a shoulder of mutton, that she might prepare supper for Stephen when he came home at night tired and hungry. How the little ones jumped to meet their mother when she came in and brought them such an unusual breakfast. She gave herself up to the joy of feeding hungry children; and then it was her first care to get rid of the goat, which she thought killed by witchcraft, and to hide this family misfortune as long as possible from her husband. But her astonishment exceeded every thing when she by chance looked into the manger and saw a whole heap of golden leaves. If she had read the Greek popular tales she would have quickly supposed that her dear goat had died of an indigestion like that of King Medas; as it was she supposed something of the sort. She sharpened her knife, cut open the dead goat, and found in its stomach a lump of gold as big as a greening apple, and another smaller one in the stomach of the kid.

Now she knew no end to her riches, yet in possessing it, she began to feel a care how she should keep it. She became uneasy, fearful, felt her heart beat, knew not whether she had better put her treasure in the chest, or bury it in the cellar. She began to be afraid of thieves and treasure diggers. She was not willing that Stephen should know all, since she feared that he would be carried away by avarice, take possession of the gold, and leave her and her children to starve. She reflected long how she should manage the matter, but could not come to any conclusion.

The priest of the village was the patron of all good wives who were oppressed—whom he always supported, either out of kindness, or because he considered them the weakest party, he gave them all due honor, and never suffered those husbands who were strikers to misuse his spiritual daughters, but if complaints of such treatment reached his ear he laid a hard penance upon the unruly house tyrant, and always took the side of the wife. Thus he had never spared the staff of penance over the grumbling Stephen, hoping by means of it to drive his ill humor out of the house. The good woman hastened to this comforting soul

curer, repeated to him her adventure with Numbernips, told how he had helped her to a great treasure, and what anxiety she felt about it—she proved the truth of her story by showing the whole treasure which she had brought along with her. The Priest crossed himself at the wonderful occurrence, rejoiced heartily at the fortune of the poor woman, and turned his cap back and forward, to try to find some good counsel, as to how she should keep possession of her wealth, and also to find means to prevent the ill-humored Stephen from getting it into his hands.

After he had considered the matter for some time, he said, listen my daughter, I will give you good counsel. Weigh the gold that I may keep it faithfully for you. I will then write a letter in the Italian language which shall say, that your brother who years ago went into foreign parts was in the Venetian service, and then sailed to India, where he died and left all his wealth by will to you, on condition that the Priest of the parish shall take care of it for you, that it may be for your sole use. I desire neither pay nor thanks from you, only consider that you owe the holy Church a thank offering for the blessing heaven has bestowed upon you, and dedicate a rich mass robe to the vestry. This advice pleased the woman greatly; she promised the Priest the robe, he weighed conscientiously in her presence the gold to the last drachm, placed it in the Church treasury, and the woman took her leave of him with a gay and light heart.

Numbernips was no less the patron of the woman than the parish priest, but it was with this difference—the latter honored the female sex particularly (as he said) because the virgin Mary belonged to it, without having any predilection for any individual maiden, which might have brought reproach on his good name—Numbernips on the other hand, hated the whole human race on account of one girl who had jilted him, though his humor had now taken a mild tone, and induced him to protect and be gracious to one single little woman. As much as the good wife had won his heart by her feelings and her conduct, so much also was he displeased with the rude Stephen, and felt a great longing to revenge the good woman upon him, to play him a trick that would vex and worry him, and thereby make him so humble that the good wife should have her wish and get the upper hand in the house. For this purpose he saddled the morning wind, set himself galloping over mountain and valley, spied like an outsider all the roads and cross paths of Bohemia, and when he saw a wanderer with a load he was behind him and watched him as narrowly as the owner of a basket looks after its contents.—In this way it was impossible for the heavy laden Stephen to escape. At the hour of vespers came along a stout man with a great pack on his back. Under his heavy steady step the burden that he carried was heard to sound. The watcher was rejoiced as he saw him at a distance, that his prey was now secure, and moved himself to de his best. The panting Stephen had nearly gained the top of the mountain, the last swell of it alone remained before him, and then his way home would be all down hill. So he strove to gain the summit, but the mountain was steep and his load heavy. He was forced more than once to rest, and put his knotty staff under the basket to take off its heavy weight while he wiped off the sweat that stood in great drops on his forehead. After stretching his strength to the utmost, he reached the top, and a fine straight path led down the other side. In the middle of the path lay a pine tree, which had been cut down, but the stump was left standing as straight as a candle, and as smooth as the top of a table, and all around it was the green grass. This sight was so inviting to the traveller and so convenient for a resting place, that he immediately deposited his loaded basket on the stump, and stretched himself opposite to it on the soft grass. Here he thought over how much clearer gain his wares would bring him this time, and found after a close calculation, that if he did not spend a single penny in the house, but depended on the skillful hands of his wife for food and clothing, he should make enough to buy him an ass in the Schmeidberg market, and to load him. The thought of how gaily in future he should lead his beast and trudge along by his side, came

to him at the time when his shoulders were smarting under the pain of the load, and was so agreeable to him that he continued the train of it. If I once get an ass said he, a horse will soon follow, and when I get a horse in the stall, I shall soon get a patch of ground to raise his hay upon—from one field I shall come to have two, from two, four, in time a whole acre, and at last a farm, and then shall Eley have a new gown. He had got thus far with his project, when Numbernips raised a whirlwind around him and overthrew at once his basket of glass, so that the broken wares fell into a thousand pieces. This was a thunderbolt to Stephen's heart: at the same time he thought he heard at a distance a loud laugh; perhaps he was deceived, and that it was only the echo giving back the sound of the breaking glass. He thought it was malicious triumph, and as the whirlwind seemed to him supernatural, he easily divided the author of his misfortunes. Oh, complained he, oh Numbernips, what have I done to you that you take away from me my morsel of bread, my bitter sweat and blood—alas I am a man dead while I am yet alive. He then got up in a kind of rage, and uttered all sorts of reproaches to the mountain spirit—villain, said he, come and murder me, since thou hast taken away from me, all that I have in the world. Indeed his life was of no more value to him in that moment than a broken glass. Numbernips however kept out of his sight and hearing. Poor Stephen resolved, if he would not carry his basket home empty, that he must gather up the fragments of glass, that he might exchange them at the glass-house, for at least a pair of glass dishes for the beginning of a new trade. Melancholy as the merchant whose ship and its lading, its men and mice have all been swallowed up in the devouring ocean, he descended the mountain bearing with him many hard thoughts and occupied with many speculations as to how he should make up his loss and continue his business. He at last recollected the goat which his wife had in the stall, yet she loved it like her children, and willingly he knew she would never part with it. He resolved, however, upon this trick to prevent his loss being known at home. He determined not to go back to his house in the daytime, but at midnight to steal in, drive away the goat to the Schmeidberg market, and spend the money for which he sold it in purchasing new wares—but on his return he would reproach and upbraid his wife for having through carelessness suffered the goat to be stolen in his absence.—With this well arranged plot, he threw the broken fragments in a heap near the village in a hedge, and awaited with great anxiety for the hour of midnight in which he might rob himself. When twelve struck, he took his thievish path, climbed over the low gate, opened the inner door and went in with a beating heart to the goat's stall; he was fearful lest his wife should find him engaged in such wicked doings. Contrary to the usual custom, the stall was open, which surprised him, though it gave him pleasure, for he found in the neglect a sort of justification of his designs. But he found the stall all empty and bare; there was nothing there with life and breath, neither goat nor kid. In the first terror he thought some treble adroit thief had been before him, for misfortunes seldom come single.—In astonishment he sunk down upon the straw and a heavy sadness came over him that this last attempt to renew his traffic had failed him.

After the busy Eley had come back from the priest, she had employed herself very carefully in making preparations to receive her husband with a good feast, to which she had invited her friend the priest. He was to take along with him a mug of spiced wine, and at the cheerful feast announce to Stephen the news of his wife's legacy, and upon what conditions she was to share it. Towards evening she looked anxiously out at the window, to see whether Stephen was coming, went out of the door in her impatience, looked up the street with her black eyes, and wondered what kept him so late; and when night came, her care and anxiety followed her into her bedroom; and she thought not of her supper, and no sleep visited her eyes, until morning, when she fell into a restless slumber. Poor Stephen was not less tired and troubled in the stall. He had

so little strength and spirit left, that he dared not knock at the door. At last he aroused himself, knocked, and said in a sad tone—Dear wife, awake and open the door to your husband. As soon as Eley heard his voice, she sprang like a dart from her couch, opened the door, and embraced her husband with joy, but he returned her hearty embraces in a cold and hasty manner; set down his basket, and threw himself sullenly on a bench. When the gay wife saw his sad countenance, it went to her heart. What troubles you, husband, said she, surprised: what is the matter? He answered only by sighs and groans. She continued to question him about the cause of his trouble, and his heart was so full he could not long conceal his misfortune from his trusty wife. When she found that Numbernips had been playing him a trick, she understood the good intentions of the Spirit, and could hardly repress her laughter, which would have displeased poor Stephen. He did not take notice of her seeming gaiety, but asked anxiously about the Goat. This amused the good woman still more, for she saw he had been spying about the house. Why are you concerned about my Goat, said she: you have not yet asked about the children? The goat is carried off to pasture, perhaps—leave off vexing yourself about the malice of Numbernips; who knows but he will still make up your loss to you in some other and better way? You may wait long enough for that, said the desperate man.—Oh! said the wife, good often comes unlooked for—take courage, Stephen, to be sure, you have no glass, and I have no goat, but we have four stout children, and four stout arms to feed them and ourselves: these are all our wealth. God have mercy, cried the sorrowful man, if the goats are gone; then throw the four babies into the water, I can never feed them. Well then, I can, said Eley.

At this moment the good priest came in; he had heard the conversation while he stood at the door. So he took up the word, and preached Stephen a sermon on the text that the love of money is the root of all evil, and after he had with sufficient sharpness explained to him the law, he announced to him the good news of his wife's legacy, took out the Italian letter and interpreted the contents of it, that the present priest of the parish was to be the executor of the will, and that he had already received the money into his safe hands.

Stephen stood stupified at the news, and could do nothing but bow, as the priest from time to time mentioned the mighty Republic of Venice, and took off his cap as he did so; at last he embraced most tenderly his wife, and from that time Stephen was the most pleasant husband, the kindest father, and most careful provider, for idleness had never been his fault.

The honest priest from time to time changed the gold into money, and bought with it a good farm on which Stephen and Eley lived the rest of their life. The remainder of the money he put to interest, and guarded the capital of his parishioner as carefully as the treasures of the church, never taking any reward for his services but the Mass Robes which Eley took care to make so splendid, that an Archbishop would not have been ashamed of them.

This tender and faithful mother lived to a great old age in happiness with her children, and Numbernips' favorite grew to be a brave man, served for a long time in the Emperor's army under Wallenstein in the thirty years' war, and became in time a very celebrated officer.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty six nails, and about forty larger sizes, in a minute, and in the same proportion larger sizes, even to spikes for shingles. The nail is hammered and comes from the machine completely heated to redness, and its capacity for being cleared is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any person who may apply for them, as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his present rights for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh. August 16, 1833. ASD:RM&F

**RAILROAD AND CANAL MAP.**—Price, in pocket-book or morocco cover, with 70 pages of letter-press description, \$2—put up in marble paper cover, with the letter press, so as to be sent by mail, \$1.50. The sheet alone, to be put in the 3d volume of the Journal, \$1.

**LAFAYETTE.**  
THE Eulogy by JOHN QUINCY ADAMS, on the Life and Services of this Benefactor of Mankind; on a beautiful paper and type; with a spirited medallion *pentographic* likeness. Is just published and for sale by  
D. K. MINOR, 35 Wall st.

✶ The subscriber will shortly commence a Saturday evening newspaper—containing all the news of the week, foreign and domestic, worthy of recording, entitled  
**KNIGHTS WEEKLY DISPATCH.**

It will contain much curious matter with illustrative engravings on wood; the price will be three cents per week, and in all cases subscribers will be called upon monthly for the amount of their subscriptions; to those who will pay in advance for 12 months will be given a handsome copper-plate engraving of some distinguished character. An extended prospectus will shortly be issued.

JOHN KNIGHT,  
Editor of the past 4 vols. of the  
Mechanics' Magazine.

**THE CIVIL ENGINEER & MACHINIST—**  
PRACTICAL Treatises of Civil Engineering, Engineer Building, Machinery, Mill Work, Engine Work, Iron Founding, &c. &c. Designed for the use of Engineers, Iron Masters, Manufacturers, and Operative Mechanics. By Charles John Blunt and E. Macdonald Stephenson, Civil Engineers, Architects, &c. &c. Consisting of examples worked through their entire detail of fundamental principle, organization, and progress of execution; and being in every case the known great works of British and Foreign Engineering complete and at length. Exemplifying the Practical application of the Laws of Statics, Dynamics, Hydraulics, Hydrostatics, Pneumatics, and General Mechanics; accompanied by full reports, specifications, estimates, and journals of progress; and illustrated by the formulae, calculations, tables, &c. in use by the first authorities. The working plans and general views of these important subjects are laid down in original drawings of great practical accuracy and careful execution, and occupying upwards of five hundred folio and imperial folio plates. In Divisions, containing from ten to fourteen plates in a folio.—Price one guinea.

Of this great work, the three first Divisions are received and for sale by WM. A. COLMAN, No. 122 Broadway, agent in the United States for the Publisher—who solicits subscriptions and the particular attention of Engineers, Iron Masters, Manufacturers and Operative Mechanics, toward the sale in the United States of this excellent and useful Publication. 11 Feb 31

#### RAILROAD CASTINGS.

MANY & WARD, Proprietors of the Albany Eagle Air Furnace and Machine Shop, will make to order car wheels, chairs and knees, and every other description of castings required for railroads. R-1y 10b1a

#### SUPERIOR GARDEN AND AGRICULTURAL SEEDS.

The Subscriber has now on hand a full supply of Garden and Field seeds, growth of 1834; among which are all the finest cabbages, cauliflower, broccolis, radishes, peas, &c., that are cultivated in England, France, and Holland, together with every sort that can be raised to advantage in our own country, and which are grown expressly for my use from stock furnished and raised by the most experienced gardeners in this country; in short, every article emanating from my store, I warrant genuine and fresh.

Also, skinless oats, potatoo oats, 44 lb. weight to the bushel, perennial rye grass, white clover, lucerne or French clover, orchard grass, Herd's grass, white mulberry, and yellow locust seeds, spring tares or vetches, genuine mangel wuzel, and ruta baga, and field turnip seeds, well worth the attention of farmers.

Canary, Hemp, Rape and other bird seeds; wholesale dealers supplied on accommodating terms. Price lists by the pound and bushel furnished on application, as also catalogues of whole collection.

The flower seed department embraces the choicest variety to be found in this country, in which are included choice double Dahila seed, carnation and choice Pinks, German and China asters, splendid double balsams, with an addition of several new varieties, accompanied with a printed direction for culture and management.

Orders will be punctually attended to and carefully packed and forwarded as directed, but as the collection of distant debts are often troublesome and sometimes impracticable it is desired that satisfactory reference be made to persons in Albany, when the order is not accompanied with the money.

W. THORNBURN,  
347 N. Market st. (opposite Post Office)

\* Mr. Thornburn is also Agent, and will at all times receive subscriptions for the NEW YORK FARMER and AMERICAN GARDENER'S MAGAZINE; QUARTERLY JOURNAL of Agriculture, Mechanics, and Manufactures; MECHANICS' MAGAZINE and Register of Inventions and Improvements; and the AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; published at No. 35 Wall street, N. Y., by D. K. MINOR, F-30b11

**MECHANICS' MAGAZINE**, Nos. 1 and 2 of VOL. 5, for JANUARY and FEBRUARY, 1835.—The two first numbers of volume 5 are now published and for sale at 35 Wall street, and at the principal bookstores. These numbers contain a great number and variety of articles, both useful and entertaining; and are printed in a style altogether superior to any of the preceding numbers of the work, and no efforts will be spared to render the work equal to any other of the kind published. Bound or stitched volumes may be had single, or in complete sets, at the office, No. 35 Wall street, of  
D. K. MINOR.

#### AGENTS FOR NEW PUBLICATIONS.

HENRY G. WOODHULL, of Wheatland, Monroe county, New York, is agent for the following Publications: The New York American Daily, at \$10.00—Tri-Weekly, at \$5.00—Semi-Weekly, at \$4.00 in advance.

The American Railroad Journal, Weekly, at \$3.00 per annum.

The Mechanics' Magazine, two volumes a year, at \$3.00 per annum.

The Quarterly Journal of Agriculture and Mechanics, at \$5.00 per annum, or \$1.50 per number.

The Family Magazine, 416 pages a year, at \$1.50 in advance.

The Monthly Repository and Library of Entertaining Knowledge, of 36 pages a month, at \$1.00 in advance, now in the 5th volume, bound volumes \$1.25.

The Ladies' Companion, of 34 pages a month, at \$3.00 per annum, in advance.

The Rochester Gem, at \$1.50 in advance.

All Communications addressed to me, at Wheatland Monroe county, will be promptly attended to. September 19, 1834.

✶ **TOWNSEND & DUFFEE**, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (with out splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. Co. Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania.

Hudson, Columbia county, New York, {  
January 29, 1835.

#### PATENT HAMMERED SHIP, BOAT, AND RAILROAD SPIKES.

✶ Railroad Spikes of every description required, made at the Albany Spike Factory.

Spikes made at the above Factory are recommended to the public as superior to any thing of the kind now in use. Ship and Boat Spikes made full size under the head, so as not to admit water.

Orders may be addressed to Messrs. ERASTUS CORNING & CO., Albany, or to THOMAS TURNER, at the Factory, Troy, N. Y. sept. 12-1y

#### MILL DAM FOUNDRY FOR SALE,

✶ The Proprietors of the Mill Dam Foundry offer for sale or lease, their well known establishment, situated one mile from Boston. The improvements consist of

No. 1. Boiler House, 50 feet by 30 feet, containing all the necessary machinery for making boilers for Locomotives and other steam Engines.

No. 2. Blacksmith's Shop, 50 feet by 30, fitted with cranes for heavy work.

No. 3. Locomotive House, 54 feet by 25, used for putting together Locomotive Engines. Several of the best Engines in use in the United States have been put in this establishment.

No. 4. A three story brick building, covered with slate, 130 feet by 40, containing two water-wheels, equal to 40 horse power; Machine Shop, filled with lathe, &c.; Pattern Shop; Rolling Mill and Furnaces, capable of rolling 4 tons of iron per diem, exclusive of other work; three Trip-Hammers, one of which is very large; Engine for blowing Cupola Furnaces, moved by water-wheel; one very superior 18 horse Steam Engine, which could be dispensed with; and a variety of other machinery.

No. 5. An Iron Foundry, 80 feet by 45, with a superior air Furnace and two Cupolas, Cranes, &c. fitted for the largest work. Attached to the Foundry is a large ware-house, containing Patterns for the Castings of Hydraulic Frames, Locomotive and other Steam Engines, Lead Mill Rolls, Gearing, Shafts, Bores, Grates, &c. &c. These were made of the most durable materials, under the direction of a very scientific and practical Engineer, and are supposed to be of great value.

No. 6. A building, 65 feet by 35, containing a large stock of chimneys, and furnaces, for making Cast Steel. This building is at present used as a boarding-house, and can accommodate a large number of men.

No. 7. A range of buildings, 300 feet long by 30, containing counting room, several store rooms, a Brass Foundry, room for cleaning castings, a large loft for storing patterns, stable for two horses, &c. &c.

The above establishment being on tide water, presents greater advantages for some kinds of business than any other in the United States. Coal and Iron can be carried from vessels in the harbors of Boston, to the wharf in front of the Factory, at 25 to 30 cents per ton. Some of the largest jobs of Iron work have been completed at this establishment; among others, the great chain and lift pumps for freeing the Dry Dock at the Navy Yard Charleston.

The situation for Railroad work is excellent, being in the angle formed by the crossing of the Providence and Worcester Railroads. The Locomotive "Yankee," now running on the latter road, and the "Jonathan," purchased by the State of Pennsylvania, were built at these works. With the Patterns and Machinery now in the premises, 12 Locomotives and as many tenders, besides a great quantity of cars and wagons, could be made per annum.

For terms, apply to

THOMAS J. ECKLEY, Treasr. &c., Boston, or to  
ROBERT BALSTON, Jr., Philadelphia.  
Boston, Dec. 29, 1834.

#### STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads.

No. 264 Elizabeth street, near Bleeker street, New-York.

✶ RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad now in operation. J35 1f

#### RAILROAD CAR WHEELS AND BOXES, AND OTHER RAILROAD CASTINGS.

✶ Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to.

Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 RUGERS, KETCHUM & GROSVENOR.

#### RAILWAY IRON.

35 tons of 1 inch by 1/2 inch,	Flat Bars in lengths of
300 do. 1 1/2 do. do.	14 to 15 feet, counter sunk
40 do. 1 3/4 do. do.	holes, end cut at an angle
500 do. 2 do. do.	of 45 degrees, with splicing
500 do. 2 1/2 do. do.	plates and axles to suit.

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 20, 22, and 26 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, and 4 1/2 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

A. G. BALSTON.

8 South Front street, Philadelphia. Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them. 471meaw

#### SURVEYORS' INSTRUMENTS.

✶ Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by

E. & G. W. BLUNT, 144 Water street, corner of Maiden lane.

#### SURVEYING AND ENGINEERING INSTRUMENTS.

✶ The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new, among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also a Railroad Goniometer, with two Telescopes—and a Leveling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

W. J. YOUNG.

Mathematical Instrument Maker,  
No. 9 Dock st., Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested. Baltimore, 1835.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES P. STABLER, Supt of Construction  
of Baltimore and Ohio Railroad.

Philadelphia, February, 1835.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

Germantown, February, 1835.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.  
Germantown and Merriam Railroad

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, FEBRUARY 21, 1835.

We give to-day the proceedings of a meeting held at Jessup's Hotel, on the evening of 19th inst., in relation to the Genesee Canal. We consider this Canal as one of the principal veins, which, when completed, will connect two great arteries of the system. It has been surveyed, and should, beyond all question, be promptly and favorably acted upon by the Legislature.

The friends of the Chesapeake and Ohio Canal will no doubt be highly gratified to learn, that one of the greatest obstacles on the whole line, (we allude to the projected tunnel of upwards of three miles in length,) may be partially obviated. Recent explorations in the vicinity of the summit, by persons qualified to judge, have satisfied them that but a short distance from the present site of the tunnel, and at about the same elevation, the waters, east and west of the dividing ridge, may be connected by a tunnel not over a mile in length, having all the advantages with regard to the proposed feeders which the present summit has. Should this, on actual survey and measurement, turn out to be the fact, of which we are assured there can be but little doubt, the greatest obstacles to a continuous water communication between the Chesapeake and Ohio will be removed, and give further stimulus to the friends of this national improvement to persevere in the grand undertaking.—[Somerset Whig.]

Jersey Railroads.—The Common Council of

New Jersey have resolved, 10 to 3, "that the passage of any act by the Legislature, authorizing any Railroad across the State would be impolitic, in violation of the faith of the State, and deeply injurious to the interest of the State.—[Journal of Commerce.]

The Florida Herald of the 17th ult. contains the message of Governor Eaton to the Legislative Council of that Territory. A topic of general interest in it, is the information it gives as to the want of an accurate survey of the coast of Florida. The only charts that the numerous American navigators of the adjacent waters have, are compilations from former French and British research. Governor Eaton thinks himself authorized to assert that statistical investigations will show that nearly one half of the whole export trade of the United States passes through the Gulf of Mexico. And yet this immense amount of trade is guided on a treacherous and dangerous coast, by charts made by foreign nations, and become incorrect from the alterations produced in the bars and in the depth of water by currents. There are two important points where light houses are wanted.

Egypt.—The *Overseers Triestine* gives the following extract from the *Egyptian Monitor*:

"ALEXANDRIA, Nov. 15.

"The Viceroy set out some time ago on his annual journey through Lower Egypt, on which he devotes his attention particularly to agriculture. He will then go to Cairo, and afterwards to Upper Egypt, in order to animate there also the labors of agriculture by his presence. At the time when the Egyptians were carrying on the war in the Morea there were at Alexandria, no more than thirty inexperienced carpenters.—At that time large ships could not enter this port without difficulty. It was necessary to send to Europe for men who were able to second the plans of the Viceroy. Every body knows the success of his persevering efforts. Alexandria now possesses a large arsenal, a well disciplined fleet, commanded by officers who have been educated in France and England, and lastly, a naval school. The officers of the navy now are, 1 general of division, or admiral, 1 brigadier general, or vice-admiral, 1 colonel, or vice-admiral 15 lieutenant colonels, 15 adjutant majors, 15 adjutants, 35 captains of the first class, 41 ditto of the second class, 63 lieutenants, 55 sub-lieutenants, 80 cadets of the first class, 31 of the second, and 55 pupils of the marine. Divine Providence has given to Ali Pasha numerous descendants; these youths are brought up to the use of arms, and initiated in serious and useful studies. The eldest of them, Said Bey, aged eleven years, has already embarked on board the Admiral's ship, the *Saint Jean d'Acres*, as cadet, of the second class. M. Koenig, a Frenchman, acquainted with the Turkish language, accompanies him, to instruct him in French. He has also a Persian master, and eminent masters are expected from Europe, to teach him drawing and the nautical sciences. M. Carrey, one of them, who has already an appointment in the Polytechnic School, came to Alexandria to instruct him in the principal of the other European languages. Twenty-six chosen young men have the honor of being admitted to be the companions of his studies. Uniting theory with practice, he will probably be qualified, in 8 years, to take the command of a man of war. Two months ago he embarked at Alexandria to commence his naval apprenticeship, on the coast of Syria, but has now returned. The disturbances in Syria and Arabia are happily terminated. Some late troubles that broke out in Latakia and the environs, were stopped, as it were, in their birth. The works in cleaning the course of the Nile are continued with unparalleled activity. More than 12,000 workmen are divided into regiments, and distributed in the two branches of the river, of Damietta and Rosetta; their number is daily increased; a vast quantity of earth is already removed, and the materials for the works are accumulating. At the desire of the engineers employed on the works, Carrey Bey lately had a hundred excavating machines made in the arsenal of Alexandria, which were immediately sent and are now at work. Thus a most useful and colossal work is carried on before our eyes in this country which possesses so many monuments of ancient splendor. The prosperity of Egypt must be infinitely increased if, as there is every reason to hope, the plan to regulate the inundation of the river should be successful.—The Pasha, who neglects nothing to accomplish this work has addressed a most flattering letter to Mr. Brunel, the contractor for the Thames tunnel, to induce him to come at least for one or two months to Egypt, in order to examine the banks of the Nile, and to forward the work by his counsel and experience: if Mr. Brunel declines he is requested at least to recommend another engineer. It was Marshal Marmont who suggested this step to the Viceroy. Next in importance to this great work will be the new Railroad, which is to be made from Cairo to Suez. Thus there will be a convenient channel of communication between Europe and India by the Red Sea. Mr. Galloway, on whom the Pasha has conferred the dignity of Bey, is gone to Europe to procure materials for the Railroad.

**GENESSEE AND ALLEGANY CANAL MEETING.**—Agreeably to public notice, a meeting of citizens of New-York, friendly to Internal Improvement, was convened at Colonel Jessup's Union Hall, corner of Greenwich and Courtlandt streets, on Saturday evening, February 7, 1835, Christian Bergh, Esq., was called to the Chair, and Messrs. George F. Hopkins and Edwin Williams were appointed Secretaries.

After a full discussion of the subject, and statements having been made to the Meeting, showing the importance of the proposed Canal, the following resolutions were unanimously adopted.

1. Resolved, That the proposed Canal from Rochester on the Erie Canal to Olean on the Allegany river, through the valleys of the Genesee and Allegany, is an object of great importance to this State, and particularly to this city, as it would open a direct communication with the valleys of the Ohio and Mississippi, and the tide waters of the Hudson.

2. Resolved, That when we consider that the Genesee and Allegany Canal would form a union of the Erie Canal with *twenty thousand miles of navigable rivers*, (the Mississippi and its tributaries,) watering thirteen States and Territories of the American Union, we cannot but view it as *superior* in its advantages to the present connexion of the Erie Canal with the waters of Lake Erie.

3. Resolved, That the great and increasing demand for *lumber*, for ships and habitations in this commercial emporium, forms an additional reason for making the proposed Canal, as in the valleys of the Genesee and Allegany abundant supplies of timber, and other lumber, of the best quality, may be readily obtained.

4. Resolved, That on a deliberate examination of the subject, and when it is considered that the proposed Canal, of about ninety miles in length, is estimated to cost only about seven hundred thousand dollars, we are firmly of opinion that no project of internal improvement promises so great benefits to this city and State, in proportion to the expenditures required.

5. Resolved, That the proposed Genesee and Allegany Canal is the only feasible work of internal improvement, which will insure to this city an advantage over Philadelphia and Baltimore in the trade of the Western States,—an object for which the States of Pennsylvania and Maryland have expended millions of dollars in constructing railroads and canals.

6. Resolved, That money expended in the construction of Railroads and Canals, is so expended to stimulate the industry, and increase the means of sustenance and comfort of the great mass of our citizens; that such improvements, so far from consuming the capital of the country, actually augment it, inasmuch as when they are completed, the money which they cost is still among us, diffused to the uses of those who are best entitled to it,—namely, those who, by the sweat of their brows, have opened channels of intercourse, which experience has taught us, add alike to the moral and physical advantages of the union; while the improvement perfected, remains a perpetual source of income, thus giving us its advantages, by means eminently adapted to the promotion of the best interests of society.

7. Resolved, That the members of the Legislature from this City are hereby earnestly requested to use their best exer-

tions in favor of the passage of a law, at the present session, authorizing the immediate construction of a Canal from Rochester to Olean.

A committee of 100 was appointed to take measures to have this subject properly presented to the Legislature now in session.

TO THE HONORABLE THE LEGISLATURE OF THE STATE OF NEW-YORK.

*The Memorial of the Subscribers, Inhabitants of the City of New-York, respectfully represents:*

That when the Erie and Champlain Canals were completed, (in 1825,) the assessed value of real estate in this city was only about fifty-eight millions of dollars; that the same is now one hundred and twenty-three millions of dollars; that they believe this astonishing increase is attributable in a great measure to the effects of the Erie Canal, which is now, however, only partially completed. Its original projectors contemplated a connexion of our tide waters with the Allegany, the Susquehanna, and the Delaware Rivers. The two latter have been done by means of hundreds of miles of Canals and Railroads, and at a cost of several millions of dollars. For the former, not a cent has been expended, although it requires only about seven hundred thousand dollars to construct it from Rochester to Olean, forming thereby a communication of more than 10,000 miles, with navigable rivers that water thirteen states, opening to our market incalculable quantities of the choicest timber and other lumber, with the rich productions of the tropical regions, and the produce of those great valleys that constitute so large a proportion of the whole area of the U. States. The interest of this city demands that it should be commenced at once; if for no other purpose than to relieve us from the paralyzing scarcity of timber, boards, &c., for our increasing ships and houses, which the demands of commerce and habitations for our growing population require.

Why this apparent neglect? Its importance has been known and long since pressed upon the Legislature in four successive messages by the late Governor Clinton. Why have trifling objects, in comparison, absorbed the attention and the resources of the State? The inhabitants on the line of this proposed Canal have never been outlawed; they are our patriotic fellow citizens, who depreciated their own estates by contributing to the construction of the Erie Canal. If they were not entitled to the common privileges of justice, their sins should not be visited upon your memorialists in this city.

The increased canal revenue, which would follow the increased transportation by means of this great internal opening, should not be forever lost to the State; and delay is every day diverting millions of commodities that would be attracted to our state, and pay tolls to our canals, and enrich and extend our commercial metropolis.

It is computed that the immediate enhancement of value of real estate in this city by the construction of the proposed canal would be at least *five per cent.*, which would amount to over *six millions of dollars.*

Pennsylvania, under all her disadvantages of almost impassable mountains, has already opened a communication, broken by alternate canals and railways, and at an immense cost, has reached the Ohio river, and will fasten on to the trade of the West, and bring it to her own metropolis, if supineness and miscalculation on the part of this State continue to predominate.

Your memorialists, therefore, most respectfully, but most earnestly pray, that a law may be passed the present session which shall require the completion of the Genesee and Allegany Canal, with the least possible delay.

[From the forthcoming number of the *Mechanics' Magazine and Register of Inventions and Improvements.*]

*Specification of the Patent granted to GEORGE CARTER, of Mottingham, in the County of Kent, Gentleman, for certain Improvements in Paddle-Wheels.*

—Sealed June 1, 1833.

To all to whom these presents shall come, &c. &c.—*Now know ye*, that in compliance with the said proviso, I, the said George Carter, do hereby declare the nature of my said invention, and the manner in which the same is to be performed, are fully described and ascertained in and by the following description thereof, reference being had to the drawing hereunto annexed, and to the figures and letters marked thereon (that is to say):

My invention consists of certain valves added to the float-boards of paddle-wheels, whereby the water against which such float-boards are acting is permitted to flow through, so soon as the float-boards would no longer be acting advantageously in propelling the vessel, and at the same time the water will not be lifted by the float-boards as they leave the water, and thus the surge caused by the back-water will be in a great measure avoided. But in order that my invention may be most fully described and understood, I will describe the drawing hereunto annexed.

Fig. 1 shows an edge view of part of a paddle-wheel constructed according to my invention, there being only two sets of float-boards shown; but as the arrangement of the parts are similar to each set of float-boards, the invention will readily be understood by a competent mechanic.

Fig. 2 represents the plan of one set of float-boards, together with the valve between them, in the position at which they are when under water, and exerting their most effective force in propelling the vessel. In each of the figures the same letters indicate similar parts, *a* being the main shaft or axis driven by the engine; *b, b*, are float-boards, which, it will be seen, are set at an angle with respect to each other, leaving a space between the two inner ends, which is to be closed by the valves, *c*, at the time the float-boards are exerting their force against the water; but the valve *c*, turns on the axis or spindle, *d*, so soon as the further holding the water would not be advantageous in propelling the vessel, at which time the water flows freely between the float-boards, *b*, and thus tends to prevent the lifting back-water. The spindle or axis, *d*, turns in bearings on the framing of the wheel, and at the other end there is affixed a crank, *e*, having a connecting rod, *f*, attached thereto, as shown in fig. 1. The connecting rod, *f*, is acted on by two inclined planes

affixed to the side of the vessel, in such manner that the connecting rod is alternately forced outwards and drawn inwards for closing and opening the valve, c. These two inclined planes are shown separately in fig. 3.

Having now described the nature of my invention, and the manner of combining the various parts, I will describe the manner of their action. I will suppose a paddle-wheel constructed, having any determined number of sets of float-boards, fitted and arranged as above described. It will be evident, that motion being communicated to the same by the main shaft, a, the valves, c, will successively be closed by the connecting rods, f, rising up the lower inclined plane, and will be kept close till it arrives to the end of the plane, when it will pass over the upper inclined plane, by which means the connecting rod will be drawn inwards towards the vessels, which will turn the valve, c, edgewise, and thus no longer prevent the water passing between the float-boards. I would observe, that although I have here described the valves, c, as turning on axes, yet it will be evident that in place thereof the same may be caused to slide up and down; nor do I confine myself to the precise arrangement of parts for turning the valves. And I would have it understood that I am aware that paddle-wheels have been before made with angular float-boards; I do not, therefore, lay any claim thereto, but do hereby wish it to be understood that I confine my claim of invention to the placing of valves, c, to stop the water from flowing between such angular float-boards during the time they are advantageously acting on the water to propel the vessel, and opening a way for the passage of the water between them so soon as their action would not be longer advantageous, and thus tending to pre-

vent the lifting the water as above described.—In witness whereof, &c.

Enrolled November 30, 1833:

[From the Journal of the Franklin Institute for Feb.]  
*List of American Patents which issued in July, 1834, with Remarks and Explanations by the Editor.*

1. For a *Saw for sawing Staves for Barrels, &c.*; Aaron Bard, and Simeon Heywood, Lunenburg, Worcester county, Massachusetts, July 8.
2. For a *Machine for Picking Curled Hair*; John Thompson, 3d, Marblehead, Essex county, Massachusetts, July 8.
3. For improvements in the *Crane used for raising and removing heavy bodies*; Hezekiah Bradford, city of New-York, July 8.

This crane is principally intended for raising and removing the earth, or other bodies, in excavating the ground for canals and railroads, and it is so constructed, that the boom which sustains the load can be made to raise it to a considerable height, and deposit it upon a bank in any spot required. The boom is rigged to a mast, and the respective motions are produced through the intervention of tackle. The arrangements have been made with much skill, and so far as a judgment can be formed from the evidence before us, we see no reason why the apparatus should not operate in a very advantageous manner. The whole description has reference to the drawings which accompany it, and these, indeed, seem absolutely necessary to the understanding of its details.

It is stated that, "by the use of the above machine, a horse, or other animal, and one driver, will accomplish the removal and deposit of a greater quantity of coals, or other heavy bodies, from one spot to another, or to and from a wharf, barge, scow, or other vessel; or remove

and deposit in the same manner, from excavations, or in other similar work, a large quantity of earth, or other heavy materials."

"By the arrangements for altering the rake of the mast, I with facility cause the weight that is raised to swing round whilst in the act of raising, and to be carried to the place where it is to be deposited, governing the motion thereof so as to make it more or less rapid, by merely changing the rake of the mast, and the position of the snatch block, so that it shall be farther from, or nearer to, the mast. I cause the emptying of the load, or the dumping, as it is called by the workmen, to be effected by the same power which raised it, and at the moment at which it arrives at its place of destination."

"I do not claim as my invention, or improvement, the introduction of the use of a crane, or boom, for the purpose of raising and removing heavy bodies; nor do I claim as my invention, or improvement, any of the several parts of the above machine. But I claim as my invention and improvement, the combination in all its substantial parts, and the above described new arrangement and adjustment of the parts of said machine to each other, in such a manner as to produce the above results, when applied to the purposes above specified."

4. For a *Portable Furnace*; John Lewis, Derby, New-Haven county, Connecticut, July 8.

5. For a *Cotton Whipping Machine*; Samuel P. Mason, Killingly, Windham county, Connecticut, July 8.

6. For an improvement in the *Construction of Hatters', or other, Kettles*; William Porter, and Abraham Sanger, Waltham, Middlesex county, Connecticut, July 8.

7. For an improvement in the *Fire-place*; Horace Saxton, Erie county, New-York, July 8.

8. For a *Horizontal Straw and Vegetable Cutter*; Paul Moody, city of Philadelphia, July 8.

The straw, or vegetables, to be cut, are placed in a box, or hopper, in which they descend by their own gravity, so as to come into contact with a revolving blade, extending from the centre to the periphery of a horizontal wheel. The patentee says, "I am aware that simply a wheel, with one or more knives, or cutters, screwed on the arms, in a machine for cutting straw, is no new thing. But the peculiar construction of the above described box-wheel in a machine for cutting straw, hay, &c. &c., which, with its regulating bottom, or gauge, the mode of fastening the knife and slitters to it, with the application of the latter in the machine to cut vegetables square, and also the apparatus above described for forcing down and compressing hay, straw, &c. &c., is what I claim as my invention and improvement."

Machines similar in principle have been previously patented and described by us; the claim, therefore, should be only for what are called improvements, the general construction belonging to the original

inventor, and not being usable without his consent.

9. For a *Hammer Hatchet*; Joel Howe, Princeton, Worcester county, Massachusetts, July 8.

If to the hammer part of a shingling hatchet, you add a claw projecting back from the hammer face, in a line with the handle, you have this machine.

10. For a *Plough*; James Jacobs, Maysville, Mason county, Kentucky, July 8.

12. For a *Filtering Apparatus*; Littleton Ayres, city of Baltimore, July 8.

13. For a *Self-balancing Slide Valve for Steam Engines*; John Kirkpatrick, city of Baltimore, July 10.

14. For an improvement on *Bushing the Sheaves of Pulleys*, and on their pins; Moses H. Marshall, Gloucester, Essex county, Massachusetts, July 10.

15. For a *Traverse Sleigh*; Bela Markham, Burlington, Chittenden county, Vermont, July 10.

17. For an improvement in *Railway Carriages*; Isaac Knight, city of Baltimore. First patented March 18th, 1829; patent surrendered, and re-issued upon an amended specification, July 10.

The same mode of sustaining the lateral thrust of the axle which forms the claim of Mr. Knight, was also claimed in one of the patents obtained by Mr. Ross Winans; which of these gentlemen was "the true and original inventor," is not a question for us to determine.

18. For an improvement in the employment of *Water Power*; Ebenezer Barford, Jay, Oxford county, Maine, July 10.

"The specific, new, and superior facilities comprised in the above described improvement, and which I claim as my own invention, are the following: 1st. The construction of the tub-wheel; its peculiar location, being immersed in a reservoir or cistern of water, and consequently not liable to be encumbered with ice; and the manner of its operation, as comprising the wedge power. 2d. The peculiar manner of using the water, so as to double its action upon the terminating wheel, with its full primary force in each action. 3d. The general arrangement and combination of the parts, without specially regarding their size or proportions, or the material of which they are constructed."

Those persons who are well acquainted with hydraulics, will see enough in the foregoing claims to convince them that the inventor has "travelled out of the record." The idea, which is clearly expressed, that the same water, in the same fall, may be twice used, "with the full primary force in each action," is so manifestly fallacious, as not to require to be disproved; if it can be twice used "with the full primary force," it may be so used a hundred times, and a fall of four feet would be as available as one of four hundred.

1. In the plan before us, a wheel, with spiral openings near its periphery, through which the water is to descend, is to be placed horizontally in a trunk, or flume;

and after it has descended through this, it is to be conducted to an undershot, or flutter, wheel; and the shafts of the two wheels are to be connected by straps, or gearing.

19. For a *Steam Bug Destroyer*; Jonathan Howlet, Greensboro', Guilford county, North Carolina, July 8.

Woe to the bed-bugs, should these steam bug destroying machines become as numerous as washing, thrashing, and churning machines, of which there seems to be some danger. This is the second from North Carolina, a State by no means prolific in patented inventions. In vol. xiii., p. 313, we described one from the State of New-York, and, not long since, there was one from the far West; and, what is somewhat curious, they are all alike, and are also all of them similar to such as had been previously described in the English journals. As the bugs are doomed to destruction, it might be some consolation to them in their dying agonies, to know that their enemies will not be able to sustain the right which they claim to their "infernal machines," under the patent laws, the great seal to the contrary notwithstanding.

20. For *Propelling Wheels*; William Kelly, city of Pittsburgh, Pennsylvania, July 10.

21. For propelling machinery by *Horse Power*; Eliakim Briggs, Fort Covington, Franklin county, New-York, July 12.

This is the common, inclined, movable floor, upon which the horse is to walk. The cross slats are to be connected together by staples and links on their under sides, which, by their bearing against each other, as the floor becomes straight, are to sustain it, with the horse, or horses, upon it. The doing this by means of the staples and links, is the part claimed as an improvement. There are at least two existing patents for sustaining such a floor, without ways between the drums at the ends; in both these instances, however, blocks, or stops, attached to, and rising to some height above, the upper sides of the slats, were to be brought into contact by the straightening of the floor. This latter method is undoubtedly preferable to that designated in the foregoing patent, but neither of them can be safely depended upon, with the weight of a horse upon the floor, as it is subjected to a leverage which will, sooner or later, cause them to fail.

22. For a *Chain of Boats*, for inland navigation; Gurdon F. Saltonstall, Darlington District, South Carolina, July 12.

As the title indicates, these boats are to be so constructed that two, three, or more, may be linked together. Those forming the two ends present a sharp bow to the water, whilst the joining ends terminate abruptly, so that, when brought together, and linked, they form one continuous boat. The specification points out the advantages to be derived from boats thus constructed, and the patentee manifestly supposes that the idea of thus connecting boats is altogether new; in this, however, he is mistaken, as will presently appear. He, in fact, seems to think that

the whole arrangement proposed by him is original, as he does not make any claim, or attempt to point out in what respect the invention is to be considered as new.

In vol. xii., p. 235, canal boats are described, for which a patent was obtained, April 6th, 1833. Six, or any other number of sections, were to be joined together, the two end sections being so formed as to cause them to pass readily through the water, the others being square, to admit of their being conveniently linked together, just as in the case before us. It is scarcely necessary to go further back, in order to prove the truth of the assertion above made.

23. For a *Machine for Drawing Boots*; Lewis Dole, and Nathaniel Peckard, Bowley, Essex county, Massachusetts, July 12.

24. For *Locks for Doors*; Simon Pettes, Bellows Falls, Windham county, Vermont, July 12.

25. For an improved *Cider Mill*; Nathan Booth, Cheshire, New-Haven county, Connecticut, July 12.

This cider mill is to be made in the form of the old-fashioned coffee or bark mill, with a conical nut, and a shell adapted to it, both of which are to be made of wood, the grooves or spirals upon them being formed by bars of iron fixed upon each, at an angle of about forty-five degrees. These bars are to be an inch wide, and half an inch thick; they are to project their whole thickness at the upper, or feeding end, but are to be let into the nut and shell, so that, at their lower ends, they shall not rise more than a sixteenth of an inch. The wood between them, at the upper ends, is to be grooved out, so as readily to admit the apples.

26. For an improvement in the mode of manufacturing of *Plates for Gun Barrels*; Harvey Mills, Springfield, Hampden county, Massachusetts, July 12.

The plates are to be prepared for welding, by rolling, instead of by forging, as has been usually done. The rollers are to be somewhat more in circumference than the length of the barrel to be formed, and are to be geared together in the ordinary way.

Flat bars are to be employed, of about three fourths of an inch thick, and wide enough to form the butt of the plate by rolling longitudinally; and in order to give the taper required, both in width and thickness, the bar is first rolled edgewise through eccentric grooves, wide enough to receive it, and is thus reduced to the proper width. It is then rolled flatwise through another groove, or grooves, so formed as to give it the required thickness at the butt, the muzzle, and the intermediate parts. The scarfing is performed in the same way, in suitable grooves, as is likewise the grooving by which it is finally prepared for welding.

27. For a *Pump Gauge*, for ascertaining the depth of the water in the hold of a vessel; James D. Woodside, city of Washington, District of Columbia, July 14.

29. For an improvement in *Railroad*

*Cars*; Joseph S. Kite, city of Philadelphia, July 14.

30. For a *Platform Balance* for weighing; Samuel L. Hay, city of Boston, Massachusetts, July 14.

31. For a *Bedstead for Invalids*; William Leo Woolf, city of New-York, July 15.

28. For a *Cooking Stove*; Samuel W. Phelps, Cincinnati, Hamilton county, Ohio, July 16.

33. For a *Rarefying Oven Cook Stove*; Samuel W. Phelps, Cincinnati, Hamilton county, Ohio, July 16.

34. For a machine for *Cutting Laths*; Dana Hubbard, Wheeling, Ohio county, Virginia, July 18.

A plank, of about eight feet in length, is to be fixed so as to slide backward and forward, horizontally, in grooves made for that purpose, in a strong bench or frame. The plank is to receive its traversing motion of about eight inches, from a pitman, or shackle bar, attached to one end of it, which is acted upon by a crank on a fly-wheel shaft. A knife, the full length of a lath, and from four to six inches wide, is to be fixed upon the sliding plank obliquely, making an angle of about 20 degrees with the edge thereof. The stuff to be cut is first sawed into boards, and then cross-cut to the length of a lath; these boards are dropped edgewise into a groove falling so as to be cut by the knife, the board bearing against a cutting block, faced with steel on its under side. The laths pass, as they are cut, through an opening made in the plank for that purpose.

35. For a *Cheese Press*; Sylvester Kibbe, Schoharie county, New-York, July 18.

36. For a *Steam Fireplace*; John W. Cochran, Lowell, Middlesex county, Massachusetts, July 18.

The apparatus here patented is intended to heat dwelling houses, ships, and other places, by means of steam generated by a fire in a common open fireplace, or caboose, without interfering with the use of the fire for culinary or other purposes.

A boiler of metal is to be made in the form of the back and jams of an ordinary fireplace. The back part of this boiler is to fit against the back of the fireplace, and its ends against the jams; it is not, however, we apprehend, to be in contact with them, but at a sufficient distance to allow heated air and flame to pass between them. The height of this boiler, judging from the drawing, will be about equal to that of the breast of the fireplace, and its depth at bottom about a foot, whence it is to slope back as it ascends; it is to have feet at the bottom, to raise it from the hearth. There are to be two long rectangular cavities in the front, something like ovens, into which the flame is designed to enter, to increase the heating effect, the double plates surrounding these cavities. Water is to be admitted through a pipe at top, and steam is to escape through another pipe, and to be thence conducted around a room, or wherever it may be wanted.

37. For a *Bush for Mill Spindles*; Samuel Merchant, Ohio county, Virginia, July 22.

Metallic wedges are to be so placed in the common wood bush as to form a collar around the neck of the spindle, with a piece of gum elastic, or some similar material, between the wood and the metallic wedge, so as to give elasticity thereto, and thus to relieve it, in some degree, from dead friction.

38. For an *Improvement in Wagons, or other Wheeled Carriages*; Reuben Rich, Albion, Oswego county, New-York, July 22.

The specification of this improvement is somewhat laconic, yet the writer terminates his description as though the few remarks made had been productive of some fatigue. The whole which can be called descriptive is in the following words: "The wheels are the same as common carriages, except the hubs, and the axles in the hubs. The axle in the hubs is a bar of iron through the hub, with the ends made round, sticking out of the hubs about two or three inches, as the case may be. These axles are made permanent in the hubs, and revolve round with the wheels, and the frame is explained in the drawing; so it needs no further explanation about it."

39. For a *Retaining Box for Oil in Upright Journals*; Henry Barton, Rochester, Monroe county, N. Y., July 22.

Below the box in which the upper gudgeon of a vertical shaft revolves, there is to be a cup for containing oil. The box is secured to the framework by a flanch on its upper side, and descends upon the gudgeon so that a cap fastened upon the shaft, just below the box, may have its sides rise so as to surround the said box, without touching it. The cup may then be nearly filled with oil, which, from the height of the rim of the cup, will necessarily flow in between the gudgeon and the box. When the shaft is to have a rapid motion, this, as the cup revolves with it, would tend, by centrifugal force, to throw the oil out of the cup; a recess, or groove, is, therefore, formed round the lower part of the cup, to retain the larger portion of the oil, and thus to counteract its tendency to overflow.

The advantages derived from the application of the retaining box are stated to be, "first, the effectual preservation of all such bearings from becoming dry, heating, and wearing, and deranging their relative positions, prevent fire from friction, which has not unfrequently been the result of rapid motion. Secondly, a great saving of oil, as the cup saves all that is applied. Thirdly, a saving of time, for, with the addition of the retaining cup, once a week will be often enough to apply oil, when, without it, from once to four times a day is required, in most cases. Fourthly, cleanliness in all fine machinery, as nothing can flow down the shaft, or spindle, to foul or otherwise disfigure or injure below."

40. For a machine for *Blocking Horse Collars*; Nathan Post, Norfolk, St. Lawrence county, New-York, July 24.

41. For a *Regulated Pressure Engine*; Daniel Livermore, Civil Engineer, Blairsville, Indiana county, Pennsylvania, July 24.

This is a very ingeniously contrived hydraulic engine, for applying the power of water to drive machinery, by a regulated pressure. The description of it is of great length, and it was our design to have epitomized it, accompanying our account with the necessary cuts. The article is not, however, yet prepared, and as we anticipate the reception of an account of its actual operation from the inventor, who is engaged in carrying it into practical operation, we shall, for a time, postpone the intended publication.

42. For a *Plough*; Henry Peachey, city of Philadelphia, July 25.

43. For a *Thrashing Machine*; Gideon Hotchkins, Windsor, Broome county, New-York, July 25.

Although a very labored description is given of this thrashing machine, and certain distinct claims are made, there still is not, in our apprehension, any thing presented which is new. The machine is of the cylinder and concave kind, with beaters which swing upon bolts passing through circular heads, in a way that is well known.

44. For improvements in the *Process of Tanning*; Edward S. and Daniel Bell, Smithfield, Jefferson county, Virginia, July 28.

45. For a *Female Auger for cutting Wagon Spoke Tenons*; John Lenher, Co-calico township, Lancaster county, Pennsylvania, July 28.

Bits for cutting round tenons, or pins, have been long and well known, and have also been used for tenoning spokes for wheels. So far as we can judge from a very imperfect description, there is nothing new in the one which is the subject of this patent; if there is, it consists merely in a change of shape, without the production of any new effect, or the employment of any improved means.

A patent was obtained for an improvement in augers, or bits, of this kind, by Mr. Abel Conant, in June, 1829, as may be seen by turning to p. 176, vol. iv.; at which time it was not pretended that there was any thing new in the thing itself. The plan, as there proposed, we think decidedly superior to that now offered.

46. For a *Saw Knife*; Lorenzo Graham, Paris, Oneida county, New-York, July 29.

Take a common knife, and cut teeth in the back of it, and you have the patent saw knife, which, we are told, may be used for culinary purposes, for pruning, or for any thing else which may be found suitable.

47. For an improvement in the mode of *Chilling Cast Iron Wheels for Railroad Cars*; Phineas Davis, Civil Engineer, city of Baltimore, July 29.

48. For promoting the *Combustion of Anthracite, in Locomotive and other Steam Engines*; Phineas Davis, Civil Engineer, city of Baltimore, July 29.

[From the London Mechanics' Magazine.]

### Birch's Patent Axletree and Box for Carriages.

Many have been the attempts made to supply that important desideratum in coach-making, namely, a permanently oiled axle, or, to speak more properly, an axle that once supplied with a sufficiency of oil will remain so—if not forever, at least for such a length of time as will obviate the numerous inconveniences with which the necessity of frequent oiling is attended; when travelling, more especially. Mr. Birch, the eminent coach maker, has recently invented and patented an axletree and box, which seems to us to go much farther towards supplying this desideratum than any other invention of the kind with which we are acquainted.

Fig. 1 of the prefixed engravings, represents the arm and shoulder of Mr. Birch's axletree. The arm, which is a perfect cylinder, has a groove cut in it to allow the passage of oil; the end is screwed to receive the nut, and a hole is cut into it for the linch-pin.

Figs. 2 and 3 are two loose cylindrical barrels, made to turn easily on the axle-arm; each is perforated with holes, to allow the free passage of oil, and to receive any grit that may have got on the surface.

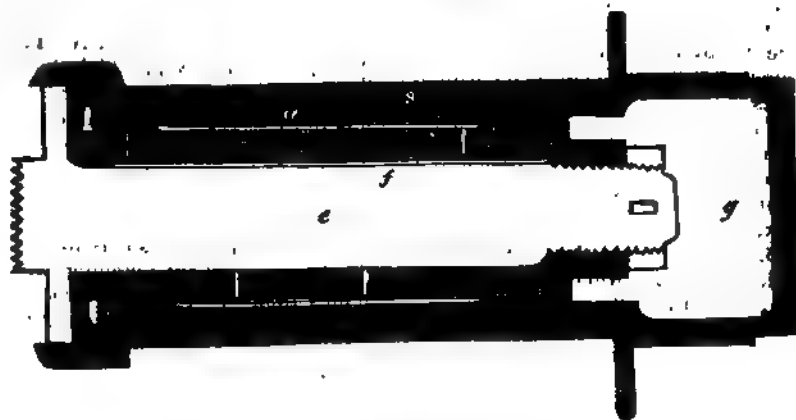

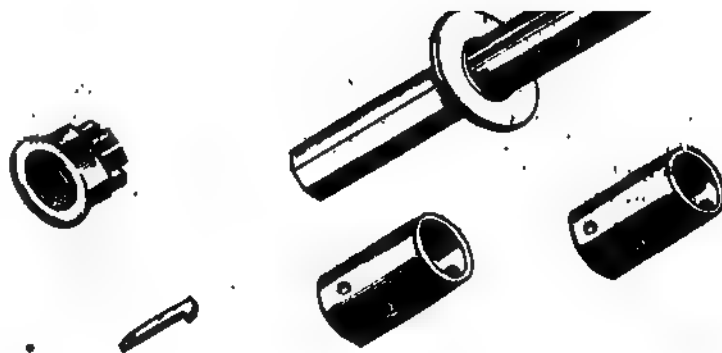

Fig. 4 is the nut, the back of which, or the end that meets the box, is made convex, so as to fit into the concave end of the box and against the cylindrical barrels. The other end of the nut is hexagonal, and cut through the six sides, in order that the linch-pin, fig. 5, may be put in at any of these sides, and the play of the wheel adjusted to a nicety.

Fig. 6 is the cap or reservoir which is screwed into the linch end of the box. Now let us put these parts together. The cylindrical barrels, (figs. 2 and 3,) are put on the arm, (fig. 1,) and, after these are inserted in the box, (which latter, as we shall see by the section, has a chamber in the rear for the oil,) the nut, (fig. 4,) is screwed on, and the linch-pin put in. Having screwed on the cap, the box will be complete, as inserted in the nave, and as shown by fig. 7.

Fig. 8 is a section on a larger scale, to show the connection of the different parts; *a a* is the box which shows the channels for the oil; *b b* the chamber to receive the oil; *c c* the cylindrical barrels; *d d* the nut; *e* the axle arm, showing the channel *f*; and *g* the cap.

Mr. Birch had fitted up a gig with one of these axletrees, one wheel of which being once oiled, was never again disturbed until worn out. The other wheel had the cap taken from it, and ran six hundred miles; the arm, &c. was then well cleaned and polished, and put together without any oil, when, in this state, the wheel ran sixty miles without sticking fast.

Mr. John Conroy, who has the charge of the stables of Her Royal Highness the Duchess of Kent, was the first person to notice the improved axletree, and he has introduced it in some of her Royal High-

ness's travelling carriages, where the improvement has been found to answer remarkably well.

One of these axletrees was put to the cabriolet of John Ramsbottom, Esq., M. P., which went out on the 9th October, 1831. One month afterwards it was examined and refitted up, and was not again touched until the 23d of May, 1832, when it was found quite full of oil. It was again refitted with the same oil, and the cabriolet continued in use until the 12th of May, 1834; when the axletree and wheel were examined, in the presence of Dr. Birkbeck and Mr. Toplis. The latter gentleman has made the following report of this examination:

"Museum of National Manufactures, &c.  
"Leicester square, May 12, 1834.

"I was this day present on the premises of Mr. Birch, coachmaker, Great Queen street, to see the state of a pair of his improved axletree boxes, after the same had been in use above two years and a half since the last replenishment with oil. They were in a cabriolet belonging to John Ramsbottom, Esq., M. P.

"There appeared to have been no partial wear; every part was free and un-

injured. All the rubbing surfaces were well covered with oil, and appeared to have been at all times sufficiently lubricated. The oil had not become glutinous, nor could much have escaped, as there remained still a sufficient quantity to keep the working parts in good order for a considerable time to come. The oil was discolored by the iron, but had no verdigris in it. The wheel was replaced without any further supply of oil.

(Signed) "CHARLES TOPLIS,  
"Director of the Museum."

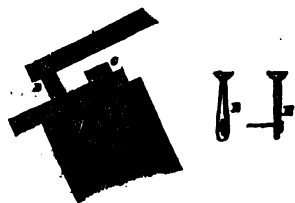

*Specification of the Patent granted to WILLIAM NORTH, of Stangate, Lambeth, in the County of Surrey, Slater, for an Improvement in Roofing or Covering Houses and other Buildings or Places.—Sealed January 29, 1835.*

To all to whom these presents shall come, &c. Now know ye that my said invention is described and ascertained in manner following, (that is to say):

My improvement in roofing or covering houses and other buildings or places, partly consists in laying and retaining upon the wooden or iron rafters of roofs, slates or slabs of slates, each of

which, with the exception of those used in the lower tier of all, is raised at its lower end by means of a fillet of slate, lead, or other metal, or of mastic composition attached to the under side of the slate or slab, which fillet, excepting when laid on slates, or slabs of slates of uneven surface, is scalloped on its under side, more or less, as may be required, so as to admit air from without to the timbers of the roof, and to let steam, heat, and damp, escape from within. My said improvement further consists in laying or retaining upon the wooden or iron rafters of such roofs, slates or slabs of slate, each of which, with the exception of those used in the upper tier of all, has attached to the top side of the upper end of each, a fillet of slate, lead, or other metal, or of mastic composition, smaller than the fillet before described, and the upper end of the slate, or slab, to which the smaller fillet is attached, being overlapped by the lower end of the slate or slab to which the larger fillet is attached, the smaller fillet excludes wet from without, while it does not prevent the air from being admitted to the timbers of the roof from without, or steam, heat, or damps, escaping from within, which completes the horizontal joints. Further, on the under side of each slate or slab, a groove is sunk at each side, the outer edges of which overlap the edges of a slate, or iron bearer, which has a corresponding groove sunk on each side of its upper surface, forming a channel for the discharge of wet that may get into the vertical joint.

And in order that this my specification may be sufficiently clear to enable competent persons, at the expiration of my patent, to practise my invention with the same advantage which I myself now possess, I shall describe the whole process of roofing, or covering houses, and other buildings or places, in the manner which I practise.

**Description of Drawing.**—The slates or slabs of slate are in thickness from 7-8 inch to 1 inch, according to the strength required, in length from 2 feet to 6 feet, the breadth about two-thirds the length. On the under side of each slate or slab, is a groove at each of its sides about 3-4 inch wide and 1-4 inch deep, fig. No. 1, A, A.

On the under side of the lower end of

each slate, excepting those used in the bottom tier, or eave course, is a groove 3-8 inch and 1-8 inch deep, into which is fastened a fillet of slate, lead, or other metal, about 3-8 by 5-8 inch, by means of a seam of mastic or oil cement, having its bottom edge scalloped according as little or much ventilation is required, or not scalloped if the face of the slate upon which it bears is of uneven surface, fig. No. 2, B. And upon the upper side of the top end of each slate, (excepting those used in the upper tier of all,) is laid a fillet of mastic or other composition, or of slate, lead, or other metal, about 1/2 inch wide, 1/4 inch thick, fig. No. 2, C: observing, that I generally use a fillet of lead for the bottom end, on account of its exposure to the weather, and its flexible quality in bending to the unevenness of the slate, and a fillet of mastic for the top end on account of its adhesive quality to the slate, and being partly protected from the weather. The bearers upon which the sides of the slates or slabs bear, forming the vertical joints, are of slate or iron, from 1 to 2 inches thick, of the same length as the slates, and about 3 inches wide, with a groove about 1/2 inch wide and 1/2 inch deep on each side of the upper face, fig. No. 1, D, D, D.

**Method of fixing the improved roofing.**—The wooden or iron rafters must be placed horizontally, of sufficient distance apart to allow of the top end of the slates having 2 inches bearing, and the bottom end to overlap the slate below 2 inches, the principals or binders are about 8 feet apart. The slate or iron bearers are sunk and nailed at the upper ends, a sufficient depth into the rafters to allow of the slates or slabs bearing equally upon the rafters and upon the bearers, the bottom-end overlapping the head of the slate below 2 inches, and the sides of the slates or slabs overlapping the sides of the bearers, fastened at the bottom-ends with metal loops, E, E, countersunk into the face of the slate, and nailed to the rafters.—In witness whereof, &c.

Enrolled July 29, 1833.

*Specification of the Patent granted to JOHN BAPTISTE CONSTANTINE TORASSA, and others, for certain Improvements in Making or Producing the Pigment commonly known by the name of White Lead or Carbonate of Lead. Sealed December 11, 1833.\**

To all to whom these presents shall come, &c. &c. Now know ye, that in compliance with the said proviso, we, the said John Baptiste Constantine Torassa, Paul Isaac Muston, and Henry Walker Wood, do hereby declare the nature of the said invention to consist in making or producing the pigment commonly known by the name of white lead without the use or employment of vinegar, or acetic, or acetous acid, in any other form or under any other name, and without the aid of artificial heat, except for the purpose of drying the white lead, as hereinafter mentioned, by reducing the ordinary lead of commerce, by friction

in water, to a very fine powder, and then exposing the said powder to atmospheric air, so that it may acquire both oxygen and carbonic acid, and thus be converted into the pigment aforesaid.

We cut common sheet lead into very small pieces or grains, or, what is preferable, we form lead into what may be termed shot, in the same manner as patent shot is made, except that no other ingredient is used to cause the lead to cool in a perfect round form. The exact shape of the pieces of lead is immaterial, but the shape of shot is the most convenient. These shots or pieces of lead should be about the size of *duck shot*, and having procured any given quantity, we place them in an open shallow wooden vessel lined with sheet lead, which we call a friction vessel, covering the bottom of the vessel with the shot or pieces of lead to the depth of about one inch, and then add water sufficient to cover them, but not more. We then tip the vessel containing the shot or pieces of lead, from side to side, in such manner as to cause the shots or pieces of lead to roll backwards and forwards on the bottom of the vessel, and thus produce great friction of the pieces of lead, one against the other, and this friction will produce an extremely fine powder of lead mixed with the water, from which it will separate easily, if left to subside. We then remove the moist powder, which is at an early period of the process of a dark color, pass it through a fine sieve, and expose it for about eight or ten days to atmospheric air, whilst the power is still in a moist state, and about the consistence of thick cream, in another shallow open vessel, which we call the carbonating vessel, where we agitate or stir it constantly, in order to expose it as much as possible to the action of the atmospheric air, until it assumes a beautiful white color, and is thus converted into the pigment commonly known by the name of white lead or carbonate of lead. The carbonating vessel may be made of any convenient material, but we prefer wood as nearly colorless as possible. When the white lead is thus produced, if it should still contain any moisture, it should be well dried before it is put into casks for sale.

Now, whereas we do not claim as the said invention the form of the friction or carbonating vessels here given, or the particular manner hereinbefore described of agitating the lead, though the foregoing is the process we usually employ as being the best adapted of any we now know of for the purpose, when engine-power is not used; but we claim as the said invention the following improvements, (that is to say,) making white lead without the use of vinegar or acetous acid, in any other form or under any other name, and without the aid of artificial heat, except for the purposes of drying the white lead, as hereinbefore mentioned, and converting the ordinary

\* The engraving and description of it are omitted. We give merely the process of manufacture.—[Ed. M.]

lead of commerce into the pigment commonly known by the name of white lead or carbonate of lead, by reducing it to a fine powder by friction, as aforesaid, and then converting that powder into the said pigment by exposing it to the action of the atmosphere, as hereinbefore described. And such invention being, to the best of our knowledge and belief, entirely new and never before used, we do hereby declare this to be our specification of the same, and that we do verily believe this our said specification doth comply in all respects fully and without reserve or disguise with the proviso in the said hereinbefore in part recited letters patent contained; wherefore we do hereby claim to maintain exclusive right and privilege to the said invention. In witness whereof, &c.

Enrolled June 10, 1834.

**THE BRICK MACHINE.**—It will probably be recollected by our readers, that in our July number, or at page 26, of volume 4th, we gave a short description of a machine for making bricks. We now give a very minute account of it, with three of the ten drawings which accompanied the pamphlet. If it answers the recommendation accompanying it, even in a slight degree, we hope to see one of them in use in the vicinity of this city.

Fig. 1, a section of the machine.

Fig. 2, a ground view of the machine and wheel-house.

Fig. 3, the front view of a set of irons for one mould, namely, the foot-block, *t*; the piston, *s*; with the wrought iron rods, *u* *v* *w*; the denser, *r* *g*; the levers, *q* *q*; and the head-block, *x*.

The above will suffice for a general description of the different plates. We shall now proceed to give a more particular and detailed description of each part of the machine, by referring to the letters upon the different plates.

**A A**, fig. 1, represent the ends of the posts as connected with the other parts of the structure. These posts must be 20 inches square, and 21 feet 2 inches long. The ends above the cap, and below the sill, must be two feet long; and if the timber be not very firm, they should be rounded at the corners, and banded with good wrought iron.

**B**, fig. 1, represents a cap. This should be framed in two parts. The upper part 50 inches long, 29 inches deep, and 20 inches thick. Into the under edge of the cap two grooves must be cut five inches square. The outer edge of each groove must be 12 1-2 inches from the end of the cap. This will place the grooves fifteen inches apart in the clear. The under part of the cap is 30 inches long, 20 inches wide, and 5 inches deep. Into this part of the cap two mortices must be made, 5 inches long and 3 wide, which, when the two parts of the cap are put together in the frame, will meet the grooves in the upper part of the cap, above described. Both parts of the cap must have a strong tenon at each end, 15 inches long, to go through the posts. The horizontal grooves in the upper part of the cap, as above described, and as seen in the plate, are to receive each two iron wedges, which regulate the thickness of the brick. The mortices in the lower part of the cap are to receive the head-blocks, which press against the under sides of the wedges.

**C**, fig. 1, represents what may be called the Denser Clamp. In the side view, seen in the plates, only one of these clamps are visible. They are 46 inches long, 26 inches deep, and 7 inches thick. They are boxed into the posts; the posts being left full in the centre, (a width of 6 inches,) and the boxing cut in 7 inches wide, and 3 inches deep. These clamps sustain the irons which confine the denser, and keep it in its vertical position. The two clamps are confined together by four bolts, the heads of which are visible in the draft. The top of the denser clamps are 75 inches below the bottom of the cap.

**D**, fig. 1, represents the Mould Clamps.

They are 46 inches long, 18 inches deep, and 7 1-2 inches thick. They are boxed into the posts in the same manner as the denser clamps, leaving a space between them of 5 inches. They are confined together in the same manner as the denser clamps, that is by four bolts, with heads at one end and screws at the other. Care must be taken to place these bolts in the positions represented in the draft, or they will interfere with the irons connected with the piston. Into these clamps the moulds are set, by cutting away in the inside, so that they will fit close when the clamps are put in and screwed firmly together. The moulds are fastened down by a bar of iron running across each end of them, and then turned at right angles, down through the denser clamps, with screws and taps at the bottom to keep them firm. These bars of iron should be three-fourths of an inch square; and the cast iron blocks, which form the ends of the mould, should be three-fourths of an inch narrower than those which form the sides. Thus formed, the bar will, in fact, compose a part of the end of the mould. The bar should be made with a joint or hook at one of the angles, so as to be easily separated, when it may be necessary to take out the moulds. If this be not done, the denser clamps must be taken out before the moulds can be moved, which will always be difficult and troublesome.

**E**, fig. 1, represents the Sill, which is 50 inches long (exclusive of the tenons), 34 inches deep, and 20 inches wide. If it be difficult to obtain timber of the proper size, I can see no special objection to framing the sill in two parts, which will require the pieces to be 17 instead of 34 inches deep. The distance between the sill and mould clamps is 9 inches, between the mould clamps and denser clamps 10 inches, and between the denser clamps and cap 75 inches.

**F**, fig. 1, represents the Driving Wheel Shaft. This, (if the bottom of it be set on a level with the top of the sill,) must be 11 feet 10 inches long.

**G G**, fig. 1 and 2, gives a ground and side view of the Driving Wheel. This, if the cog-work be of wood, should be at least eight feet in diameter; if made of iron, it may be much smaller. It should be strong and firm, as for mill gearing.

**H**, fig. 1 and 2, the Crank Shaft. This must be of the firmest kind of timber, 14 inches diameter, and 15 feet long. One end of this shaft runs on a gudgeon, which rests in a block or gallow, which gallow hangs from the beam *i*. To the other end is attached the crank, by a wing.

**I I**, fig. 1 and 2, represents the Wallower or Pinion. This must be precisely one half the size of the driving wheel, whatever that may be.

**K**, fig. 1 and 2. In fig. 1 and 2 are seen the edge view of the small cog wheel which is attached to the crank shaft near the end next the press.

The wheel *k* 2 is supported by a short shaft, one end of which rests in the beam *d*, and the other in a beam passing between, and supported by, the two small posts last named. Upon the shafts of the wheel *k* 3 are placed four kams, which roll directly under the centre of the wrists. These kams, as they roll round, press down upon the ends of the levers which are attached to the rods of the piston, and thus raise the bottom of the moulds. The fulcrum upon which these levers rest must be precisely two-thirds of the way from the point where the kams act upon them, to the point where they are attached to the rods. The kams being 12 inches long, the bottom of the moulds will raise six inches, which is the proper distance.

**L L L**, fig. 1 and 2, represents the Crank. This is a casting of about four hundred pounds weight; and it is somewhat difficult to give a clear description of it, either in language or by a draft. The end towards the driving wheel is composed of a wing, (such as usually forms a part of a wing-gudgeon,) which goes into the crank shaft. The bearing next the wing must be 8 inches long by four and three-fourths inches in diameter. The first angle, which must be four and one-half inches square, and so long that it will bring the wrist eight and one-half inches from the bearing just described, that is, by counting from the centre of the bearing to the centre of the wrist. The first wrist, which must be four and one-fourth inches diameter and five inches long, in

the clear. The second angle, four and one-fourth inches square and eight and one-half long, counting from the centre of the wrist back to the centre of motion in the crank. The centre bearing, four inches diameter and seven inches long. We have now got through the description of the first half of the crank, (or half next the driving wheel,) with the two first bearings. The second wrist must not be in an opposite direction from the first, but on an angle of 90 degrees from it, taking the centre of motion in the crank as the angular point: or, in other words, when the wrist next the driving wheel is up to the highest point of the circle which the wrist describes, then, and at that moment, the second wrist must be on a level with the respective bearings of the crank.

**M M**, fig. 1 and 2, the pole, or arm to which the team is hitched.

**d d**, fig. 1 and 2. These beams sustain the two outer bearings of the crank. In fig. 1 the ends of these beams only are seen. They should be so framed into the posts that their upper edges shall be 37 in. lower than the bottom of the cap.

**f f**, fig. 1, shows two of the corner posts of the wheel house. These should be one foot square and 13 feet long, (besides the tenons.)

**g g**, fig. 2, the two outside beams of the wheel house. These should be one foot square, and 30 feet long in the clear. **g g**, fig. 1, shows where these beams are inserted in the posts, that is, one foot below the top of the posts.

**h h**, fig. 1 and 2, the plates of the wheel house, 10 inches square, and 32 feet long.

**i i**, fig. 1 and 2. In figure 2 are seen the two centre beams which support the upper end of the driving wheel shaft, and one end of the crank shaft. These beams should be at least 15 inches deep and 12 inches wide. They are two feet apart in the clear, and are framed into the posts on a level with the outer beams.

**k**, fig. 1 and 2, the head block which sustains the upper end of the driving wheel shaft. This block should be 4 feet long, 1 foot square, and boxed into the upper edges of the beams 2 inches.

**l l**, fig. 1 and 2; these are mere braces, to keep the frame firm in its place, so that the gearing will run steady. Too much care cannot well be taken in the construction of the wheel house to make it firm and incapable of swerving.

**m m**, fig. 1; these posts sustain the centre beams; they must be 1 foot square, and 13 feet long in the clear. Braces, of at least 6 feet in length, should be framed from these posts to the centre beams.

**n n**, fig. 1, one of the sills of the wheel house. The sills should be of durable timber, 1 foot square, and long enough to form a square of 30 feet in the clear.

**o o**, fig. 2, the horse track, which must of course be as large as practicable in a square of thirty feet.

**p p**, fig. 2, the four pitman rods which run from the levers to the crank, and serve to straighten and bend the levers.

**q q**, figure 6, the levers and the denser. The bodies of these are 3 inches square, or as near that shape as the patterns can be drawn from the sand; the joints six inches wide, with projections on the outside of the joints to receive the snibils or hooks which hold the levers together, (*q*, 1.) The convex and concave half circles upon which the levers bend, should be one inch in diameter. The manner in which these circles should be cut, is obvious in fig. 7, which represents an edge view of the levers and denser. The levers should be precisely 36 inches long, counting from the angular points, and the denser 41 inches long; this, when the levers are straight, will give a distance of 9 feet 6 inches from the bottom of the cap to the bottom of the denser, (allowing one inch for the head block.)

**r r**, fig. 6, the bottom of the denser and top of the piston. The size of these must be the same as the flat surface of the brick, which size will be regulated by the custom of the place, or the views of the builder. It may be well to remember, however, that a brick 9 inches long, 4 1-2 inches wide, and 2 1-2 inches thick, contains a fraction over 100 cubic inches of clay—whereas, a brick 8 inches long, 4 inches wide, and 2 inches thick, contains only 64 cubic inches. It will therefore take less than two-thirds the force to press a brick of the latter than of the former description.

HARNESSE'S NEWLY INVENTED BRICK-MAKING MACHINE.

Fig. 1.

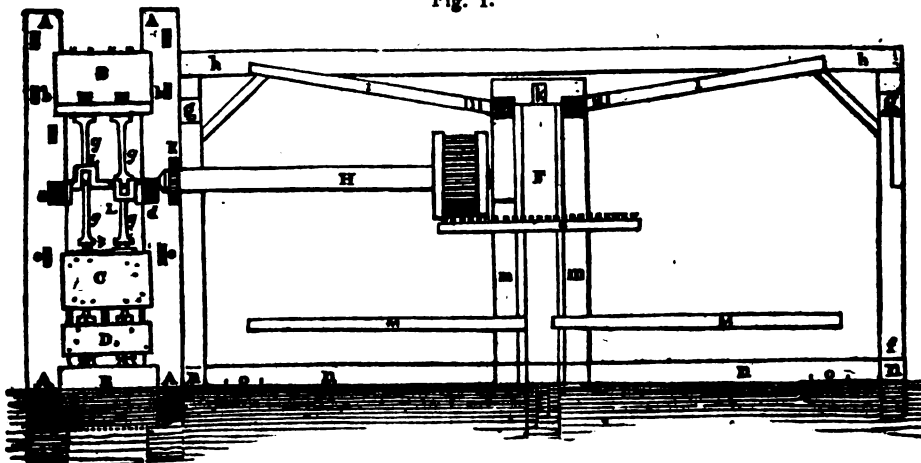

Fig. 2.

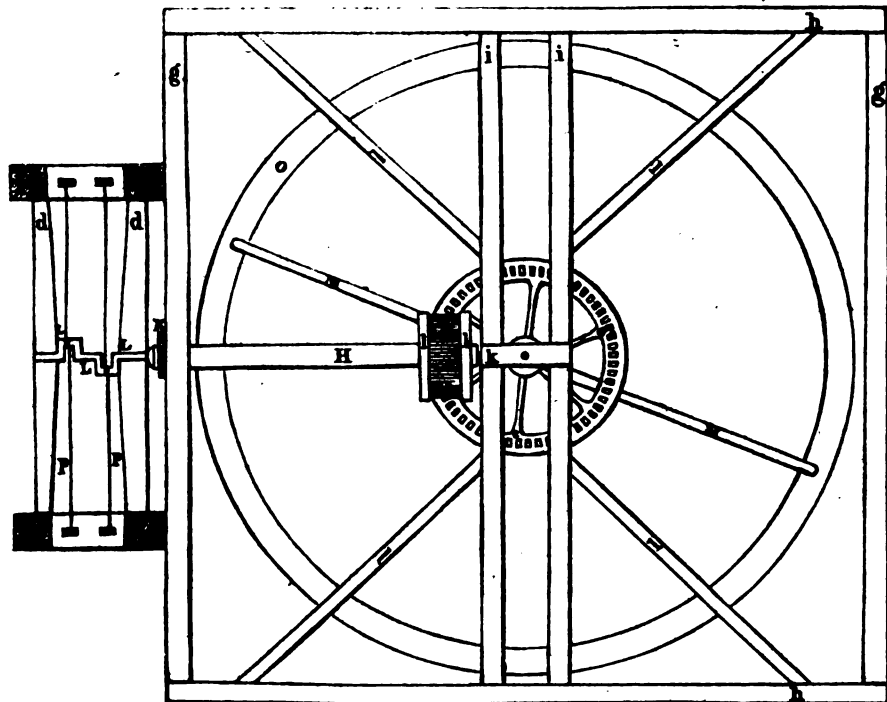

Fig. 6.

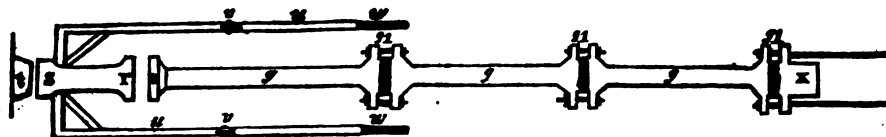

Fig. 6, the bottom of the piston. This should be 6 inches long, and 4 inches wide, with a cavity in the bottom of the right shape to receive a conical projection of the foot block; this conical projection of the foot block should be 2 inches square at the base, and 2 inches high, running to a point in the centre. This shape of the piston and foot block is necessary to make the piston, when it falls, invariably come to the same position. The piston must be cast with a hole through it large enough to receive a cross bar, 2 1/3 inches deep, and 5/8ths of an inch thick. [See fig. 6.] To each end of this cross bar is attached a rod 3/4ths of an inch square. These rods must 19 1/2 inches apart, (from outside to outside,) and firmly braced. There must be a joint in the rods at *v*, and perhaps it may be best to have another immediately below where the rods are attached to the raising levers. The raising levers must be forked near the point where they rest upon the fulcrum, so as to meet the upper ends of the raising rods. In order to have these le-

vers perfectly inflexible, they must be covered on the upper side with a thin bar of iron, which must be spiked or screwed firmly to the wooden part of the lever. The screws at the top of the rods are for the purpose of fastening them to the raising levers, and keeping the work at all times tight and in its proper place. The top of these rods, from the joint at *v*, must be inclined about two inches inward, so as to prevent the raising levers from interfering with each other. *t*, fig. 6, the foot block. This should be 5 inches deep, and a little smaller at the top than the bottom of the piston, so that the clay which may happen to fall through, or round the mould, shall not rest upon the block. The bottom of this block should be at least one foot square; but all, except the part which comes in contact with the piston, may be only 1 inch thick.

A machine with two pair of moulds only, will make from fifty to seventy thousand bricks per week. But if the regular market be large, it can, by using a steam engine of 10 horse

power, work sixteen moulds, (four on each side of the wheel house,) and make two hundred thousand bricks per week. It will probably be the better way, however, to multiply the number of presses, rather than the number of moulds in a press.

In order to make the best quality of brick, the clay must be pulverized, and rendered completely clear of lumps and small stones. This is easily done when the clay has been thrown up during the winter and frozen. All that is necessary to do with frozen clay is to pass it through a coarse wire rolling screen. This screen may either be turned by hand, or attached to a drum connected with the driving wheel. To screen clay by hand is about the same labor as to make it into mortar. Every manufacturer can have his own plan for pulverizing his clay.

The clay, to be worked to advantage, must be in a dry state—not so as to become dust, but so that it will in a measure lose its adhesive qualities. In this state, when pressed, the air will escape out of it, and it will become solid. But if it be moist, it is impossible to press it—or rather, the water renders it so elastic that it will not “stay pressed.” I would advise the manufacturer to connect with his wheel house a large shed, sufficient to protect clay for 150,000 bricks. Into this shed let him wheel clay during the winter, so as to have the whole of it frozen. He will then be able to supply the market in the spring with one kiln of brick as soon as they may be wanted. The balance of the clay required for the season should, during the winter, be thrown up into ridges. It can then be taken into the shed during dry weather, always taking care to have the shed so full that the press may not have to stop during a week of wet weather.

**THE TOMATO.**—Few vegetables of equal value are so little known through this country. None are more readily raised—none better repay the cultivator.

The tomato, or love apple, is a luxury in common use through the south of Europe. In France and Italy, particularly, it is largely employed in culinary preparations. Either raw or stewed, in soups, or fricasees, for gravy, or catsup, as well as for pickles and sweetmeats, its utility is such that it would not readily be dispensed with by those who have given it a fair trial in these various ways. The experience of several years enables me to recommend the tomato to all who desire the acquisition in their gardens of a cheap luxury. For salubrity none can surpass it. It has been constantly used in various forms at almost every meal during the last three or four seasons, by myself and several acquaintances, whose health continued excellent, even when the prevalence of the cholera banished fruits and vegetables generally from most tables.

Should any who are now unacquainted with the tomato, make the experiment of raising a supply, they may add to the simple luxuries of the table by adopting these directions for making tomato catsup:

The tomatoes, when fully ripe, should be bruised and boiled slowly for half an hour—then strained through a cloth, and the liquid boiled for another half hour, after adding salt and spices, but without any admixture of water. The scum should be carefully removed, so as to render the liquid as pure as possible. It should be bottled and kept in a cool place. After it has stood a short time, should any sediment be discovered in the bottles, (and in order to know with certainty, clear glass bottles would be the best for this use,) the liquor should be poured off into other bottles. In this way catsup of excellent quality—preferable, in my judgment, to that from mushroom, and clear as choice Madeira—can be readily made, in greater quantity, and with less trouble, than in the common way. RHO.—[Genesee Farmer.]

## NEW-YORK AMERICAN.

FEBRUARY 14—20, 1838.

## LITERARY NOTICES.

A SERMON PREACHED BEFORE THE GOVERNOR AND LEGISLATURE OF MASSACHUSETTS, ON THE ANNUAL ELECTION, JAN. 7th, 1838, by JONATHAN M. WAINWRIGHT, D. D., Rector of Trinity Church, Boston. Boston: DUTTON & WENTWORTH Printers to the State.—It is in some sort a rule with us, in these occasional literary notices, to confine ourselves, in regard to sermons and other analogous publications, to a mere mention of their title and subject. In the case before us, however, both the topics selected and the manner of treating them, induce us to depart from this rule.

Called to preach, according to a good old custom, the annual sermon before the Government and Legislature of Massachusetts, Dr. Wainwright happily availed himself of the occasion "to exhibit religion in what may be called its temporal aspect, as advancing and sustaining principles essential to the welfare and happiness of civil society." The text he chose was from Deuteronomy xv. ii. "The poor shall never cease out of the land," and the lesson which he thence eloquently inculcated was, that *inequality of individual wealth is the ordinance of Providence, and essential to civilization*. That the preacher acquitted himself ably, it is only matter of course for one who knows him, to say—that he acquitted himself satisfactorily to his auditors, is evinced by the handsome edition of the discourse now before us, published at the request, and by the order, of the Senate of Massachusetts.

We have read this discourse with unfeigned gratification, and wish it could be read by all, whose heads may have been turned by the idle and wicked doctrines—with which selfish and heartless demagogues have so recently excited our happy country—of incompatibility between the rich and the poor. There is no such incompatibility; but, on the contrary, mutual dependence and mutual interests. Nor is this inequality of condition among men, the result of political institutions, though undoubtedly it may be greatly aggravated thereby. It is founded in nature, and sanctioned by revelation; and as by man's wisdom or agency it was not ordained, so neither by man's wisdom or agency can it be abolished. But we are sermonizing ourselves, when a more accustomed and far more capable Preacher invites the attention of our readers.

The scope of the Sermon is—*first*, to interpret accurately the broad assertion of the text; *secondly*, to prove that the inequality of condition which it implies, is essential to the political, intellectual, moral and religious improvement of the human race; and *lastly*, to point out how "the more grievous and repulsive circumstances attending upon this constitution of the social state, may be meliorated, if not entirely removed."

From the second head we make the following extract:

"But follow out the consequences resulting from diversity in the condition of men, and you will see accumulated reasons to assent to, and admire, this ordination of Providence. No one who has for a moment thought of the subject can doubt, that in order to the comfort even, of civilized society, very many different occupations must be performed, and must be carried on at the same time—lands must be tilled, houses must be built, fabrics for clothing must be made, implements of various kinds must be formed, and vessels must be constructed and navigated. It is equally obvi-

ous that the division of labor is essential to giving full effect to these occupations. In addition to these employments, there are various other trades and professions to be filled, and also different offices for the true maintenance of the laws—and without laws, no civilized community can hold together. If you oblige every man to be his own mechanic, farmer, manufacturer and navigator, and to do his share of the magistracy upon some principle of rotation, it is obvious that we can none of us enjoy as many, or as great, advantages as we do under the present system; and it is equally obvious, that all these various occupations, receiving only the divided attention of an individual, must very fast go backward, and the knowledge and dexterity which men now possess in their various employments, in proportion to the undivided attention they give to them, must be constantly and rapidly diminished. I take it for granted that no man, even in very moderate circumstances, would choose to relinquish the comforts and conveniences he now possesses, in his humble habitation. He would not like to be deprived of his glazed windows which let in the light while they exclude the cold, of the various domestic utensils of iron and earthenware in which his simple meals are cooked and served up, or the different fabrics of linen, cotton, silk, woollen and leather, which supply himself and his family with clothing; nor would he choose to exchange his convenient tools of trade, for the stone-axe and the flint knife of the Indian. Yet such would be the inevitable result, were the benign and admirable principle of the division of labor to be banished from society. How then is it to be maintained—how? but by holding forth to every man a stimulus to activity, ingenuity and enterprise, in the hope of bettering his condition.—Many employments essential to the existence of civilized society, are yet so unpleasant in themselves, that no one would undertake them but from the excitement of such a motive. But were all men to be made equal, and were they obliged by the laws of society to continue so, there could be no such animating impulse to the exertion of our bodily or mental powers. Who is so ignorant of himself and of human nature, as not to know, that until we have secured the kind assistance of habit, labor of every description is irksome, and that the hope of advancing ourselves, is the exciting principle that overcomes our natural love of ease, and sharpens all the human faculties. Strike this out of the social state, and we should deteriorate year by year, till we dropped down to the degraded level of savages. Now this important, this essential principle cannot subsist without the distinction of rich and poor."

Thus much for the physical discomforts of the state of equality. The next extract illustrates, by a fine rhetorical figure, the intellectual stagnation it would induce:

Were the circumstances of men equalized, their intellectual and moral faculties would become feeble and sluggish, and the state of the moral world would be analogous to that of our physical earth, were the whole reduced to one unvaried plain. The whole atmosphere then being one dense, unwholesome vapour, the whole land, one dead and dreary flat, the whole ocean, one waveless and stagnant pool, our world would be fit only for those huge misshapen creatures, the next remove from senseless matter, such as geologists have discovered, and such as existed ere the Almighty Architect broke up the fountains of the great deep, and caused the mountains and hills to pierce the skies and condense the vapors for refreshing showers, the healthful winds to blow about them, the joyous rivers to pour down from their summits, carrying verdure and fruitfulness to the humble valleys beneath, and thus rendering it capable of supporting active life, in varied and condense forms of beauty and utility to man.

One only extract more, and we must, though reluctantly, conclude:

The unequal distribution of wealth then, we believe to be not only an unalterable consequence of the nature of man, and the state of being in which he is placed, but also the only system by which his happiness and improvement can be promoted in this state of being. We do not

deny that there are evils attending it, and that in some countries it has been fostered by artificial and injurious regulations, until it has become oppressive and unreasonable. The principle itself is fundamentally true and just, but it may be, and often has been, pushed to such an extreme, as to be detrimental to the best interests of society. When in any country there are only two classes, the very rich and the very poor, or when the tendency of political regulations is to produce this effect, as is the case under all aristocratical governments, the consequences must be bad. The middling class, as it is sometimes called, that is, the portion of the community that lies between the two extremes of riches and poverty, is its strength, intelligence and virtue. Of course we may infer, that that country is the most prosperous and happy which has the greatest proportion of this class of citizens. It is one evil, and we may assert it to be the strongest, of the value of our public institutions, that they have produced this effect, and that in no country on the face of the earth, is the middling class relatively as large as in our own. How then are we to maintain ourselves in this enviable condition? Or if, as is feared by some, we are gradually declining from it, and individuals amongst us are becoming too rich, by the accumulation of capital, and others getting to be too poor and threatening to become burdens upon society, how are we to remedy the evil and prevent its recurrence?—These are momentous questions. Can we accomplish the object, and keep the happy medium through legislative interference, by checking the increase of capital, by forcing the wealthy under a process of unequal taxation to give up a portion of their superabundance, or by an agrarian system of the division of property? None but a madman, an ignorant enthusiast, or an unprincipled demagogue could propose this latter remedy. Nor will the others be tolerated for a moment by sound and enlightened judgment. As to an equal division of property by some act of legalized violence, it would avail just as much as a child's play in drawing squares and circles upon a sandy beach; the returning tide of human passions, enterprise and industry, (and return it would as certainly as ocean ebb and flow) would sweep the whole away, and leave the surface marked as before by unequal ridges. If we would save the structure of society from utter dissolution, maintain inviolate our civil and religious liberties, and preserve ourselves from political dangers, awful and incalculable, let us most sacredly guard the rights of property. This is the palladium of nations, this is the pledge of their improvement in all the arts that civilize and adorn our nature, this is their security for advancement in morals and religion. Once touch the rights of property, let it be felt that men are impeded and harassed in their efforts to obtain it, that its possession is insecure, and that portions of it may be taken from them by unequal taxation, and you immediately stop enterprise, and with enterprise the progress of knowledge, and with the progress of knowledge, that also of virtue—and then where is the happiness of such a community? It must be torn by intestine commotion, or if this is kept under by the military arm of a strong and despotic executive, it must prepare to see its commerce sicken and die, its agriculture decay, its manufactures silent and in ruins, its schools deserted, its roads impassable and infested with banditti, and all its institutions relapsing into a state of Turkish barbarism.

ALLEN PRESCOTT, or the fortunes of a New-England boy; by the author of "Morals of pleasure," &c., 2 vols.—New York, HARPER & BROTHERS. It requires no great discrimination to find out that this novel is written by a lady, or that she is one thoroughly imbued with American feelings and principles. The hero, Allen Prescott, the only son of a destitute and widowed mother, with his New England education, hardihood of character, and uprightness of principle, begins the world without any thing but hope and energy, and arrives where so many living, have under almost similar circumstances, arrived, at honor and fortune. This simple story, intersper-

and with incidents of village life, of early, interrupted, but finally, triumphant love, is made the vehicle of illustrating the real equality of our political institutions, and the opportunities they open alike to all, of personal distinction. The style is easy and equal—though we confess our dislike of the frequent introduction of the ungrammatical peculiarities of Yankee speech—accurate, though they doubtless are, as records of real life. The sentiments and reflections are always praiseworthy, and often very happily expressed. Take for instance this description of maternal love:

"Some one has said that the heart of a mother is the master piece of Nature's works. It is, at least, that portion of them which least asks the aid of culture. She may be required to be instructed how to govern, to punish, or to teach; but to *love*—through evil as well as good report—constantly, fervently, deeply, to the sacrifice of herself, even unto death, what mother, if she be true to the instincts of her nature, does not know."

In the only other extract we have room for, our readers will find a just and discriminating view of the influence and effect of our political institutions, upon the mass of native Americans:

"There is in the laboring classes (a distinction growing every day more reputable) not only a practical good sense and susceptibility of refined and generous emotions, but a patriotism, a true estimate of our blessings as a people, and of our individual responsibilities, and on subjects of national interest, a justness of thinking, of which you are little aware. You profess to love your country; but learn to reduce this abstract idea to the practical test of love of countrymen—not a sympathy with a select few, having the same advantages and pursuits with yourself; your heart must warm to every one who worthily bears the name of an American! and must sincerely approve of those institutions by which you, as an individual, are rendered of comparatively small importance, while the mass is elevated."

There is good feeling and sound judgment in these sentiments, and with these we take leave of the book.

**THE PRINCESS, or the Beguine**; by LADY MORGAN. 2 vols. Philadelphia: Carey, Lea & Blanchard.—What a Princess is, all our readers know, or think they do; but a Beguine, what is that? Nothing more than a Sister of Charity, vowed to works of kindness and benevolence, gratuitously rendered to the poor, the sick, and the dying. The title, therefore, of this new novel of *Miladi Morgan*, would seem to embrace the two extremes of human existence, the favorite of fortune and of a court, and the humble attendant upon the pallets of the outcasts of the world. How the apparently discordant attributes of these two conditions, are brought together and harmonized, it is not for us to reveal, for that would spoil much of the interest of the story. We, therefore, only add, that there is much of what purports to be English high life, but which, in the scale of morals, may be set down as very low and degraded life—some *connaissance* about Flemish pictures, Flemish architecture, and Flemish history, and a great deal of politics about Belgium and the Belgian Revolution of, we believe, four days.—It is written throughout in the sprightly, dashing vein of Lady Morgan.

**THE PENNY CYCLOPEDIA OF THE SOCIETY FOR THE DIFFUSION OF KNOWLEDGE**: Vol. I. London. CHARLES KNIGHT, New York Wm. JACKSON, Boston MUNRO & FRANCIS.—The title of this volume is so explanatory, and the character of the weekly numbers in which the Cyclopædia is distributed, is so well known, as to render any re-

marks on this head from us, unnecessary. The volume now before us comprises the numbers for a year. It is a royal 8 vo, of 580 pp. of double columns—and costs neatly bound in calf \$2!

As a book of ready reference, such a work is of great value, and this one, has in that view this peculiar advantage, that whereas other Cyclopædia, as give under a general head an elaborate treatise on each branch of knowledge, and refer for the explanation of particular terms, to what is said under that general head—this Cyclopædia gives under each term, as it occurs alphabetically, such explanation as to render it abundantly intelligible. The superiority, for occasions of reference merely, of such a plan will at once be perceived.—This volume extends through A to Andes. The plates, cuts, and engravings &c., as in the separate numbers, are all preserved here.

**WONDERFUL CHARACTERS** by HENRY WILSON: 1 Vol. 8 vo. New York HARPER & BROTHERS, for sale by Wm. BURNETT. Here is a very curious and handsomely printed volume, which unannounced and without signal note in advance of any sort, comes before the public in a most agreeable shape. We know not whether it is a republication from England or whether the collection embodied in these pages is now for the first time given to the light—but we do know that we have a capital assemblage of "Wonderful Characters" high and low, with engravings of some of them worthy of the pencil of Cruikshanks. Beggars and princesses, *Jean of Arc*, and *Bampfylde Moore Carew*, figure alternately and make up a gallery of portraits in which "the ultimities and summities" or the lowest and the highest pitch of which man's nature is susceptible, are exhibited and personified.

**THE FOREIGN QUARTERLY REVIEW**, for Dec. 1834; American edition, Vol. 1, No. 2, being No. IX. of the Republication of the Foreign Reviews, by THEO. FOSTER: New York, Wm. VAN NOEMAN.—Several papers of interest in this number will reward the attention of readers. One on the state of Italy—in reference to a publication by the Italian *Beltrami*, who put forth several years ago a ridiculous book in this country, claiming to have discovered the sources of the *Mississippi*—presents some views of the actual state of that country, new to us. That on the Viscount *Arlineourt's* new novel—historical, polemical, and *anti-Louis Philippist*—of which the Brewer King of Ghent, *Jacques Van Artevelde*, is the hero; and a third on the Prussian Government and its administration, where the paternal wisdom and affection of a despotic sovereign, contrast strongly, by their beneficent results, with some of the realities of the rule of our republican Chief Magistrate—will be found interesting.

**A PRACTICAL SUMMARY OF THE LAW OF ASSIGNMENTS IN TRUST FOR THE BENEFIT OF CREDITORS, WITH AN APPENDIX OF FORMS**; by JOSEPH K. ANGELL. Boston: Hilliard Gray, & Co.—This handsomely printed volume exhibits, in a methodical form, and within a small compass, a mass of information in relation to the law of assignment, which will prove very valuable to persons engaged in trade. As a general rule, it is about as absurd to become one's own lawyer, as for "every man to be his own doctor," as the advertisements of Empyrics have it; for in either case, people are equally prone to quack their persons or property to death. But there are branches of the profession with which it is important that every one should be in some de-

gree familiar; and in a commercial country like ours, where property is so fluctuating, every business man should be acquainted with the relations created between debtor and creditor, and learn in what manner, and subject to whose direction, the effects of an insolvent debtor are to be distributed among those to whom he is indebted, and those who may have become his sureties. The infinite diversity of cases that continually arise, will indeed render such knowledge of but little service to himself unless backed by legal advice: but the attainment of a certain degree of information, will teach him at least when to resort to a practitioner: and we do not remember a work from which such knowledge may be more readily gathered, than from that before us.

The great number of cases cited, with the analytical table of contents, must render this a very convenient volume to the junior members of the profession.

**THE KNICKERBOCKER**, for February; N. York, J. DISTURNELL.

**THE U. S. MILITARY AND NAVAL MAGAZINE**, for February; Washington, BENJ. HOMANS.

These are the only two periodicals for the month that have reached us.

The Knickerbocker has a pleasant variety, and some good articles. Of these, we specify the first on "Life," by Dr. S. L. Metcalf—and the Historical notice of Columbia College. The Cruise of a Guinea-man, is extravagant and impossible, though evincing considerable power. We take an extract from the notice of Columbia College, which only does justice to the value of, and course of instruction pursued in, that institution:

In October, 1829, the office of President became vacant by the death of Dr. Harria, who had continued to an advanced age, with great zeal and fidelity, to preside over the institution; and early in the following December, the Hon. William A. Duer, then one of the Circuit Judges of this State, was elected to supply the vacancy.

On the first of January, 1830, the new President entered upon the duties of his office, and within the same month, the system of instruction was extended by the establishment of a *Literary and Scientific course*, distinct from the *full course*, in which latter the classical studies are included, and students were allowed to be matriculated for any of the various branches composing the new course, in which also were comprised the Modern Languages of Europe.—Free scholarships were established by the bounty of the Trustees, the nominations to which were vested in each of the religious denominations in the city, and in its leading institutions for the promotion of knowledge; and the Professors of the college were authorized to deliver Public Lectures at extra hours in any of the branches of Literature and Science, falling within their respective departments.

The sub-graduate course of instruction was subsequently enlarged by the addition of lectures on the Evidences of Christianity,—by the extension of the English studies in the younger classes, and enlarging those in the departments of Natural Philosophy and Chemistry. A course of lectures on the Constitutional Jurisprudence of the United States has since been added to the studies of the senior class, and directed to be delivered by the President. To enable the Faculty to discharge these increased duties, one hour was added to the daily attendance of the students, so that each class now attends one hour every day in each department of its studies; or four hours daily, exclusive both of the previous religious service, and exercise in declamation in the Chapel; and of the subsequent attendance of one hour of those who pursue the study of Hebrew, or any of the Modern Languages.

The Grammar School of the college was also placed upon a footing which has rendered it more

extensively useful, as well as more efficient as a preparatory seminary to the college, and the immediate superintendence of it committed to the *Jay Professor of the Ancient Languages*, as Rector of the Grammar School. A junior department has since been added, and the number of instructors increased to eight in the Classical, Mathematical, and English departments, besides two of Modern Languages; so that a pupil may be received into the minor department of the Grammar School as soon as he can read the English language, and in nine or ten years be conducted upon one uniform system of instruction, through both the preparatory school, and the college, and at the end of that time receive his first-degree; or in five or six years he may receive a complete English and Mathematical education, including any of the modern languages, so as to fit him for business without entering the college; or he may, if duly qualified, enter either the Grammar School or the college at any stage of their respective courses.

As the institution now stands, the Faculty of the college consists of a President and five Professors; all of whom the students of the full sub-graduate course are required to attend, and any of whom, except those of Greek and Latin languages, students of the Literary to Scientific course, may attend. These form the *Board of the College*, to aid the President in administering its discipline. There are besides, a Professor of Law, Professors of the principal modern languages of Europe, and one of the Hebrew language, upon any of whom the attendance of the students of both courses is voluntary; but these are not members of the Board.

The general course of instruction in the college, may be considered as three fold, viz:

1. *The Full Course*, including every branch of collegiate study, and entitling the successful student to the degree of *Bachelor of Arts*.

2. *The Literary and Scientific Course*, which excludes the study of the Ancient Languages, but includes that of the Modern. To the successful student in this course is given, upon a vote of the Board of Trustees, a College Testimonial, differing but in name and extent, from the Academic degree of the full course.

3. *The Veterinary Course*, which is intended for graduates and others, who have made some proficiency in learning, and is limited solely by the wishes of parents, or of the applicants themselves, both in regard to extent and duration, and admits, also, of a higher course of instruction in the Greek and Latin languages.

An attendance on the first course requires the student to be matriculated, and forbids all professional studies, and pursuits. An attendance on the second, also requires matriculation, but admits of professional studies at the same time.

An attendance on the third course is altogether voluntary, requiring no matriculation, and capable of being rendered consistent not only with professional pursuits, but even with mercantile and mechanical employments.

No student is admitted into the Freshman, or lowest class of the full course, unless he be accurately acquainted with the Grammar of both the Greek and Latin tongues, including such rules of Prosody as may be applicable to the Poets he is required to be examined upon. He must be master of the greater part of Cæsar's Commentaries, of the principal Orations of Cicero, of the first eight Books of the *Æneid*, Sallust, certain portions of the Greek Testament, Jacob's Greek Reader, and parts of the *Cyropædia* and of the *Iliad*. He must also be able to translate English into grammatical Latin, and be well versed in Arithmetic and Algebra, as far as the end of Simple Equations, and with Modern Geography; and no student is admitted into an upper class without being master of the previous part of the course,—nor are any admitted from other colleges, without a certificate of good standing.

The full course of studies in the different classes is as follows, viz:

**FIRST YEAR. Freshman Class.**—Parts of Livy and Horace, Dalzel's *Collectanea Græca Majora*, Latin prose compositions, Roman Antiquities, and Ancient Geography, the Elements of Geometry, Algebra, Universal Grammar, English Composition, and outline of Ancient History, with Chronology.

**SECOND YEAR. Sophomore Class.**—Virgil's *Georgics*, the *Satires* and *Epistles* of Horace, Cicero, *de Senectute* and *de Amicitia*, parts of Tacitus, Dalzel's and Dunbar's *Collectanea Græca Majora*, Homer's *Iliad*, Latin composition in prose and verse, Greek and Roman Antiquities, plain Trigonometry and its applications, Algebra, Elementary Chemistry, Elements of Rhetoric and Oratory, English Composition and outline of Modern History with Chronology.

**THIRD YEAR. Junior Class.**—Cicero *de Oratore* and *de Officiis*, Terence, Horace's *Art of Poetry*, Longinus, Homer's *Iliad*, continued, Latin composition, Greek and Roman Antiquities, Spherical Trigonometry, Conic Sections, Analytic Geometry, Fluxions, Natural Philosophy, including Chemistry, applied to the Arts, Principles of Taste and Criticism, English Composition, Logic, General History of the Literature of Europe, Ancient and Modern, with a Critical History of English Literature.

**FOURTH YEAR. Senior Class.**—The classical part of the course of this year is conducted in such a manner as the Professors of Languages, with the assent of the President, may direct.—The Greek Tragedians are the authors principally read. Fluxions, Natural Philosophy, including Mechanics, Astronomy, according to the methods of Newton, La Place and La Grange, History of Philosophy, Intellectual and Moral Philosophy, Political Economy, Evidences of Christianity, Constitutional Jurisprudence of the United States, and English Composition.

All the classes are, moreover, exercised at stated periods in declamation upon subjects connected with their respective courses. There are two public examinations of all the classes every year. The first, or *intermediate* examination, commences on the first Monday in March; and the second or concluding examination on the fourth Monday preceding the vacation, which begins on the first day of August, and ends on the first Monday in October.

An honorary testimonial decorated with suitable devices, and bearing the seal of the college, is adjudged at the intermediate examinations to the student in each class who is most distinguished for his general merit; and an additional testimonial to the best in each department of study; and at the concluding examination, a gold medal is adjudged to the student of the best general standing in each class, a silver medal in each class to the best, and a bronze medal to the next best in each department; all of which are announced and delivered at the annual commencement, held on the day subsequent to the opening of every term.

Of this number of the *Military and Naval Magazine*, we have only room to speak in terms of general praise, and to express our satisfaction at finding by a notice at the close of it, that its patronage is largely increased. It should be further increased.

#### SUMMARY.

St. Louis, Jan. 20.—*Luck is a fortune.*—The Steamboat *Warsaw* arrived at this port on Saturday last from New Orleans. The *Warsaw* was seriously deribled by striking a snag below Ste. Genevieve Island, some of the cargo is in consequence damaged. The snag made a large hole in the bow of the boat, and the pilot at the wheel, discovered that she must go down, altered her course so as to run her on the bar nearly opposite. Strangely enough, in steering on this course the pilot, without seeing it, ran the boat directly athwart of the wreck of the Steamboat *Illinois*, which was sunk some years since, and so great was her head way that the bow was lifted out of the water, and safely moored. She was thus afforded an excellent opportunity of making the necessary repairs. The boat remained in this position for twelve hours; when the river, as good fortune would again have it, rose sufficiently to drift her clear of the wreck.

The Mississippi is rising slowly, and is clear of ice below this point. Thus far, we have had a remarkably mild winter—and should it continue for a few days more, we need expect no further interruption to navigation. The *Olive Branch* and *Potosi* have departed for Louisville.

Captain Gibson of barque *Kent*, at Boston, reports, that just as he was leaving St. Helena, (28th Dec.) the American Consul informed him that the British trade with China had been stopped by the Chinese Government.

**THE FAITHFUL AND SAGACIOUS DOG AGAIN.**—The *Baltimore American* in alluding to the recent Fires, has this paragraph:

A circumstance came to our knowledge yesterday, which shows that there must be incendiaries among us. The Foreman of our office, soon after he reached his dwelling in Pitt street, between eleven and twelve on Thursday night, had his attention arrested by an unusual barking of his dog, in the yard. On going out to ascertain the cause, the sagacious animal continued to bark, and ran several times to the stable door, as if some one were within. The manner of the dog at once led his master to open it, when he found a parcel of combustibles burning on the floor. They had apparently been but a short time on fire, and were extinguished without difficulty, but it is evident that but for the singular warning of the dog the stable would have been fired.

**MEDITERRANEAN SQUADRON.**—The *Gazette* publishes the annexed extract of a letter from the Fleet Surgeon of the Mediterranean Squadron. It is dated on board the United States Ship *Delaware* in Nov.

"I am still in the land of the living, after having been exposed to scenes almost calculated to make death too familiar. Our ship remains in port with the *Shark*; we sent their men, as fast as they were attacked, to an island in the harbor. It has been a melancholy scene. About 20 of our men have died, and two were buried this day; but from the favorable state of those now under care, and a change for the better in the weather, this afternoon, I entertain strong hopes that the worst is over. No officer has died on board, and but one petty officer, the acting boatswain of the *Shark*, who died on the 15th inst."

*Attempt by the Malays to cut off and Murder the Crew of another American Vessel.*—The barque *Kent* arrived yesterday from Pulo Penang, coast of Sumatra, brings intelligence of an attempt to cut off the barque *Derby*, of Salem, belonging to Stephen C. Phillips, on the coast of Sumatra, by the Malays. The information is conveyed in the following letter from Captain Felt, master of the *Derby*, and published in the *Salem Observer* of this morning:

On the 10th June, 1834, lying at Trabangan Tehute, barque *Derby*, of Salem, leading pepper; while on shore that day, received information that a prow in a neighboring port was preparing to come that night and cut me off; I went on board immediately, and made preparations for the defence of the vessel, and kept a vigilant watch through the night. As the day began to dawn, discovered the prow right ahead, coming slowly down upon me, and within musket shot.

I opened my musketry and cannon upon him, upon which he put his head towards the sea, and appeared to be getting off as fast as he could, soon after which a strong breeze came up, and I saw the prow pass in shore towards the village of Qualah Ralissahn. I afterwards learnt from several sources that the prow came from Qualah Assahan, and had 12 men on board; one of which came to Baocougang, while I lay there, and stated, that they started with creeses only, calculating to find us unprepared to receive them—to dagger every person on board, and to possess themselves of the money—and that they took freely of opium in order to be more desperate."

Capt. Felt, in a letter to his owner, says:—"It is high time that the American Government had a sloop of war on this coast from March to August, (during the pepper season) to protect our commerce. She would do a great deal of good to the Americans."

I will be remembered that the ship *Henry Ewing*, of Boston, was obliged to leave the coast of Sumatra, about the same time of the occurrence related above, on account of an attempt to cut her off at Assahan.—[*Boston Transcript*.]

The extreme cold of Sunday, the 8th inst., extended to Charleston, S. C., where the thermometer, at day break, was at zero! a temperature (according to the Southern Patriot) 8 or 10 degrees colder than ever before experienced in that city.

The number of American whale ships at sea, on the 30th of January, ult., was 257, comprising an aggregate of about 1,000,000 tons, and manned by about 9000 seamen. There were in port at the same date, 16 whale ships, making a total of 273. The number of sperm whale ships which may be expected to arrive within the present year is estimated at 70, and their cargoes at 135,000 bbls. oil, valued at more than three million dollars.—[Journal of Commerce.]

NAVAL CHAPLAIN.—We are happy to learn that the Rev. C. S. Stewart has been assigned as Chaplain to the Navy Yard at Brooklyn.

Death of Gen. Hampton.—General WADE HAMPTON, of South Carolina, died at his residence in Columbia, on the 4th inst., in the 81st year of his age. Gen. Hampton served with great gallantry in the war of the revolution, and though then a mere youth, was, with one or more of his brothers, distinguished in the partisan warfare under Marion and Sumter, in South Carolina.—During the late war with Great Britain he commanded a brigade on the northern frontier. He was one of the wealthiest men, if not the wealthiest, in the whole Southern country.—[Courier.]

The packet ship Britannia, Captain Waite, which arrived last week from Liverpool, is said to have brought the largest cargo of any packet since the line was established. It appears by the manifest, that she had on board 1805 cases and bales, 300 tons of iron and steel. &c. &c.

Invoice cost of the cargo,	\$497,000
One case gold,	50,000

Value, on first cost of cargo,	\$547,000

[Merquante Adv.]

#### IMPORTANT NEWS FROM FRANCE.

Recall of the French Minister from Washington.—Passports tendered to the American Minister at Paris.

Such most unhappily, is the intelligence we have this day to communicate to our readers.—In the midst of prosperity unequalled, in the full tide of honorable and successful enterprise, straining every faculty in the race of physical, intellectual and moral improvement—while the ocean is whitened with our canvass—while the forests of the far wilderness are disappearing before our pioneers of civilization—while new undertakings are every where springing up for Canals and Railroads, to connect and benefit regions between which nature seemed to have placed insurmountable barriers—and when in addition, and as a grace and ornament to all these enterprises for advancing our wealth and material power and enjoyments, we are alive to, and liberally mindful of, the claims which the cause of education, of morals, and of religion has upon us, as a nation of Christian freemen—at such a period, and in the midst of such a career, the blight and curse, the desolation and demoralization of war seem about to fall on us.

By the *Orpheus* from Liverpool we have our London papers of Friday 16th ult. inclusive—and these furnish from the Paris *Moniteur* of Wednesday 14th, (the official paper,) a notification that M. Serrurier had been recalled from Washington, and that Mr. Livingston had been apprised that passports were ready for him—an

intimation to depart, which, it is said in several of the Paris papers, he meant immediately to comply with.

The paragraph in the *Moniteur* which follows this announcement of the cessation of diplomatic intercourse between the two countries, that "in consequence of the engagements" of France, the project of law for satisfying the indemnity to America would be immediately presented to the Chamber, must be looked on—unless there is really a disposition and intention on the part of the Ministry to make a sincere and vigorous effort to carry the indemnity through—as an insulting mockery.

We were not parties in, nor consenting to, the councils which have thus needlessly precipitated this matter; but "being in," we must bear ourselves as Americans, having a common cause, and resolved, at all hazards, if the flag of war must be thrown out, to rally under it, even to the death.

But we yet trust that war may be avoided—much, if not all, now depends on Congress.

What then should Congress do? *Norman* at present. If the recall of the Minister be not followed up by any other hostile demonstration—though we confess our apprehension now is, that an embargo may be laid in the French ports—if however, nothing of this sort occur, we would wish this Congress might adjourn, without adopting any definitive measure—and that the President should forthwith issue a proclamation requiring the next Congress to meet on or about the 1st August. By that time the purposes of France would be fully developed, the feelings of our own people would be ascertained—and a Congress assembling under such circumstances, and acting with full knowledge and calm deliberation, would carry with them the assent of the whole nation.

We annex some extracts from Liverpool letters, which shew how this question is viewed there.

*Extract of a letter dated Liverpool, Jan. 15.*

There is a regular demand for Cotton, and prices have undergone little change of late, good fair Bowed selling to day at 9 3.4d. Business in Manchester is steady, and there is a tolerably steady sale for yarns for export, at prices which afford some remuneration at the present value of Cotton.

The aspect of affairs between your country and France is not pleasant. From present appearances, there is no reason to suppose the payment stipulated for in the treaty will be made, and the matter therefore will rest with Congress what measures, if any, are now to be adopted.

*Extract of a letter dated Liverpool, January 17.*

The recall of the French Minister at Washington is important, and will throw the course of proceedings on your Legislature, which we trust and believe will be temperate.

It is probable that the Chamber of Deputies will make some specific offer of compensation, which perhaps it would be well to accept. British shipping would certainly derive much benefit from war between France and the U. States, but trade will thereby be thrown out of its customary channels, and become hazardous and uncertain.

The Paris Correspondent of the London Times—a paper noted for the accuracy of its foreign information—thus writes about the rupture between France and us. It looks more favourably on the case than other accounts.

#### Private Correspondence.

PARIS, WEDNESDAY, JAN. 14.

For the second time since the declaration of American independence an interruption has taken place in the friendly relations between the Government of this country and that of the United States. In both instances a question of pecuniary indemnity has led to the rupture, and now, as formerly, there is very little doubt that the French will consent to concede to the American people all that justice requires, as soon as they have done what is necessary to heal the wound which their self-love has sustained from the Message of General Jackson. On the former occasion two French frigates were seized and carried into American ports, but were afterwards released on the adjustment of the question at issue. A still stronger measure would probably have resulted from the present posture of affairs between the two countries, had not the French Government, in the very act of recalling their Minister at Washington, and of intimating to Mr. Livingston that his passports were ready for him, conveyed the official notification that the bill for the adjustment of the American differences was this very day to be presented to the Chamber of Deputies.

It could not, of course, have been very agreeable either to the Government or the Chamber to have been beard during the discussion by the presence of an American Minister in the Hotel of the Rue de la Victoire. On the other hand, Mr. Livingston has not thought it necessary in the meantime to embark for the United States, but takes his passports in the first instance for London, when he will be at hand to give his advice to Mr. Barton, the Secretary of Legation, who will probably be left here in the capacity of Chargé d'Affaires, unless it shall appear, contrary to all present probability, that the whole of the French establishment at Washington is to retire with M. Serrurier, its chief, and that the last postern is to be closed to any thing like an amicable accommodation.

The National of this morning, in a short but sarcastic paragraph, treats this rupture of diplomatic intercourse, and the whole course adopted by this Government, which it had anticipated pretty accurately, as amounting to a declaration of war; but suggests that in eight days, when the outraged dignity of the Citizen King has been satisfied, and the Chamber has sanctioned the treaty for the payment of the 25,000,000 of francs to America, peace will be restored. In fact, ever since the arrival of the Message, the opposition journals have been much more moderate in their tone than was to have been expected under the circumstances, considering the part they took against the Duke de Broglie's Administration when the affair was formerly under discussion in the Chamber.

There appears, however, to be little ground for alarm. In the official conferences which have taken place within the last four days, between Mr. Livingston and Admiral de Rigny, every sort of assurance was given, on the one side and the other, of the anxiety of both Governments to avoid any serious cause of quarrel.—On the part of the Foreign Secretary this assurance was strongly repeated the night before last, and as late as yesterday, at the hour of post, there was not the least idea at the American legation that such a proceeding would have been resorted to as that which must by that time have been resolved on, and of which you have the official announcement in this morning's *Moniteur*.

We derive from Paris papers of Jan. 14, the following important paragraphs:—

Confidential instructions have been sent to the sea-ports, and principal commercial towns of the kingdom, to get up petitions for the immediate adoption by the Chambers of the treaty with the United States.

Mr. Middleton, Secretary to the American Legation at Madrid, arrived in Paris on Monday, with instructions for 12,000,000 reals delivered by Spain in pursuance of the new treaty between the two Powers for liquidating the claims of American citizens upon Spain.

Old Cobbett, we see, is re-elected from Old Aun, and is classed in the list of Reformers; but we think it an even chance if he does not support the Duke.

The steam ship *Pylades*, new and carefully constructed, bound from Amsterdam to the East Indies, sank in smooth water off the coast, on the second day out—without having met with any accident whatever. The crew and passengers, to the number of 40 were taken off by fishermen. It is believed that holes had been maliciously bored in the vessel and temporarily stopped.

The Duke of Leuchtenberg, husband of the young Queen of Portugal, was expected in London at the last dates, on his way to Lisbon.

Old Talleyrand has at last retired from public life. His political testament is annexed. It was said in Paris that Louis Philippe hinted, that it should not be made public, which the wily statesman turned off by saying, the only question was, "whether it should be published by the royal permission, or his own."

The *Moniteur* announces officially that the King has accepted the resignation of the Prince de Talleyrand as Ambassador to England, and has appointed General Sebastiani to be his successor.

The Prince's letter follows:

"Sir—When the confidence of the King called me four years ago to the Embassy of London, the very difficulties of the mission induced me to obey. I believe I have accomplished for the benefit of France and of the King, two objects of interest which I have always had in my mind, and which I have always considered as closely connected. During these four years, the maintenance of a general peace has admitted of all our relations being simplified. Our policy, isolated as it was, has been mingled with that of the other nations. It has been accepted, appreciated, and honored by the honest men of all countries. The co-operation we have obtained from England has cost nothing to our independence or our national feelings; and such has been our respect for the rights of all, such has been the candor of our proceedings, that far from creating mistrust, it is our guarantee that has been called for against the spirit of Propagandism which disturbs the old States of Europe. It is certainly owing to the exalted wisdom and great abilities of the King that all these satisfactory results must be attributed. I claim for myself no other merit than that of having divined before all others the profound thoughts of the King, and to have announced them to those who have since been convinced of the truth of my words.

Now that all Europe knows and admires the King, and thereby the principal difficulties have been surmounted—now that England has perhaps an equal want with ourselves for a mutual alliance between us, and that the path which she appears to be inclined to follow must induce her to prefer a mind with traditions less ancient than mine, I conceive I may, without failing in my devoted duty to the King or to France, entreat, respectfully, that his Majesty will accept my resignation, which I request you, Sir, will lay before him. My great age, the infirmities which are its natural consequence, the repose they counsel, the reflection they suggest, render this step very simple, but too fully justify it, and even render it a duty. I rely upon the equity and goodness of the King to form the same judgment. Accept, etc.

PRINCE DE TALLEYRAND."

The following is the answer of the Minister for Foreign Affairs, which is only dated on Wednesday—

"PRINCE—I have laid before the King the letter you addressed to the Minister of Foreign Affairs, by which you entreat his Majesty to accept your resignation of the Embassy at London. His Majesty for a long time hesitated to accept it. In associating yourself with his sentiments and those of his Government, you have so ably concurred in giving stability to the new Monarchy and grandeur to its policy, and in maintaining the Peace of Europe, that the King could not consent to deprive France of your powerful services and vast experience. But his Majesty has felt that after so great and so long a career, the attachment

even, and the gratitude he bears towards you, will not suffer him any longer to resist the desire you have expressed to him, on account of your great age, to retire into repose. Accept, etc. RYAN."

Our venerable fellow-citizen Col. Trumbull has, under his own signature, made a statement in our columns to-day, not without interest, as bearing upon the French question of indemnity.

Col. Trumbull's suggestion of discriminating duties, or non-intercourse, rather than war, is surely the right one to begin with.

To the Editor of the New York American:

SIR: The dispute between the United States and France, on the question of compensation to the citizens of the former, for spoliation committed by the Government or the citizens of the latter, and which the actual Government of France, stipulated by treaty to pay,—has arrived at such a stage, as to require correct information, in order to the forming of a just and firm decision on our part.

I possess some information which I think it my duty to offer as authentic and accurate.

In the commencement of the French Revolution, more than forty years ago, spoliation to a considerable extent, were committed by subjects of Great Britain on our Commerce, and became in some measure the cause of the mission of Mr. Jay to London, which mission resulted in what is commonly called Jay's Treaty. I acted on that occasion as Secretary to Mr. Jay.

The 7th article of that Treaty is in the words following:

"Whereas complaints have been made by diverse merchants and others, citizens of the United States, that, during the war in which his Majesty is now engaged, they have sustained considerable losses and damages, by reason of irregular and illegal captures or condemnations of their vessels and other property, under the color of authority or commissions from his Majesty; and that from various circumstances belonging to the said cases, an adequate compensation for the losses and damages so sustained, cannot now be actually obtained, had, and received; it is agreed, that in all such cases where adequate compensation cannot, for whatever reason, be now actually obtained, had and received, by the said merchants and others, in the ordinary course of justice; full and complete compensation for the same, will be made by the British Government to the said complainants. But it is distinctly understood that this provision is not to extend to such losses or damages as have been occasioned by the manifest delay, or negligence, or wilful omission of the claimants.

"For the purpose of ascertaining the amount of any such losses or damages, Five Commissioners shall be appointed and authorized to act in London, exactly in the same manner as is directed with respect to those mentioned in the preceding article, and after having taken the same oath or affirmation (mutatis mutandis) the same term of eighteen months is also assigned for the reception of claims, and they are in like manner authorized to extend the same in particular cases. They shall receive testimony, books, papers and evidence in the same latitude, and exercise the like discretion and power respecting that subject; and shall decide the claims in question, according to the merits of the several cases, and to Justice, Equity, and the Law of Nations; the award of the said Commissioners, or of any such three of them as aforesaid, shall, in all cases, be final and conclusive, both as to the justice of the case, and to the amount to be paid to the claimant; and his Britannick Majesty undertakes to cause the same to be paid to such claimants, in specie, without any deduction, in such place or places, and at such time or times, as shall be awarded by the same

Commissioners, and on condition of such releases or assignments to be given by the claimants, as by the said Commissioners may be directed."

Reference is made in the above to the Sixth Article, for the mode in which the Commissioners were to be appointed, it was as follows:

"Two of them shall be appointed by his Majesty, two of them by the President of the United States, by and with the advice and consent of the Senate thereof; and the Fifth by the unanimous voice of the other Four: and if they should not agree in such choice, then the Commissioners named by the two parties shall respectively propose one person, and of the two names so proposed, one shall be drawn by lot, in the presence of the four original Commissioners."

The two Commissioners named by Great Britain, were Sir John Nichol, and Maurice Swabey, Esq. her two most distinguished Civil Lawyers. Those named by the United States, were Christopher Gore and William Pinckney, two of their most distinguished Lawyers.

These gentlemen could not agree in electing by unanimous vote a Fifth, and therefore, resort was had to the other mode pointed out by the Treaty, and I became the Fifth Commissioner.

The Board set in London, received a multitude of complaints, which were carefully examined, rejected some, admitted others; and in cases where we decided that loss or damage had been sustained, for which adequate compensation could not be obtained, had and received in the ordinary course of judicial proceedings, we referred all the papers to our merchants, (one British and one American) to examine and make up the accounts, and ascertain the exact amount of such loss and damage. They reported to the Board, who again, by themselves and their Secretary, re-examined the merchants' report; and finally, having determined the amount, we gave our award signed by each member, as well as by our Secretary, for such sum, payable at sixty days, at the British Treasury.

All these awards were paid with strict mercantile punctuality on the day named; and I never heard a single complaint of delay, much less of a refusal to pay.

The aggregate amount exceeded 10,000,000 of dollars, or 50,000,000 of French livres.

The period of time in which these British spoliation were committed, was short, commencing in 1793 and terminating at the date of the Treaty, Nov. 19th, 1794.

The spoliation complained of, as having been committed by France, extended over many years, and were wholesale transactions, comprehending seizures of ships in port, and confiscations of property on the land, as well as on the ocean.

Who can believe that the amount of these latter was not as great as that of the former? Who can doubt that it far very exceeded them? From the experience which I acquired by a careful examination of a great number, I have not a doubt, that if an accurate examination of each case could now be made, it would be found that the damage done to our commerce in the course of the wild revelation of France, decupled the damage done by Great Britain in that short period; and that, instead of 25 millions, the sum of 250 millions of livres would hardly be an equitable compensation.

The Legislative power of France seem disposed to nullify the Treaty on their part, and have once refused to grant the sum stipulated to be

paid to us. Why should we not nullify it on ours, by withdrawing these commercial advantages which are not only stipulated, but which France has actually enjoyed since the date of the Treaty?

And having first done this, if we should in addition impose heavy duties on the importation of French wines, silks, &c. &c. and apply the monies which might thus be collected to the payment of the losses which have been sustained by our citizens, would not that be a wiser and safer course than a resort to hostile measures?

If Mr. Gore or Mr. Pinckney were living, I should have left this office to them, but being the only survivor of those scenes, I have felt that this duty devolves on me, notwithstanding the neutral character which I held in the commission.

I am, sir, &c. &c.

12th February, 1835.

JNO. TRUMBULL.

**LIFE INSURANCE.**—*Andersonian Soires.*—Last Monday, Dr. Hannay read a paper on the subject of Life Insurance, which excited much interest and considerable discussion, to which Messrs. Faichney, Retty, Professor Watt, and Mr. Smith of Jordanhill, took a part. The Doctor gave a sketch of the origin of insurance, tracing its progress from a very remote period. The Greeks probably, and certainly the Romans, as was shown by the references to Livy, Suetonius, and Cicero, practised a modification of marine insurance, which succeeding ages have perfected. The practice was lost, with many other useful customs, in the dark ages, and the Doctor showed that early in the 15th century it was probably revived at Barcelona. It was the more necessary to trace the history of marine insurance, as it had the precedence of all other kinds, and is the same in principle as that which has human life for its object. The modifications of the principle in respect to the insurance of human life were next shown and clearly explained. The application of it to different, nay, to all ranks, was next put in so clear a point, (as the President remarked,) as to preclude all discussion. To the wealthy proprietor of an entailed estate, to procure provision for the younger branches of his family, to the man of moderate income, to accomplish in a certain manner what his means could not do by its slow accumulations without much inconvenience; to professional men, whose gains and estate perish with themselves; to the officer and the man of business; and he likewise adverted to its extreme usefulness to the agriculturist, an effect of life insurance of more extended operation and application than is generally believed. The discussion of the evening turned on the question of its being suited to the operative part of the community. The Essayist contended that it was within the reach of a very large proportion of our working men and mechanics, who, by saving one shilling a week when of the age of 25, could secure £100 at death to their heirs, and so defend many a widowed mother and poor orphan from the miseries of unprotected poverty, aggravated by recent bereavement. That half a million of persons contribute to savings banks institutions, which, though highly useful, fall far short of insurance as a means of provision, which last at once makes the provision sure—one from which the person insuring cannot draw back; and he is thus bound as it were to save to pay the premium; whereas he may in a fit of thoughtlessness or extravagance, withdraw his all from a savings bank, and dissipate it, and what is worse, become dissipated himself. The securing of debts and the attainment of a provision in old age, were also adduced as other advantages of the practice; and the facilities afforded by some offices in the way of loans to those who had paid a certain number of premiums was urged as an advantage under certain circumstances to the man in trade. Various arguments against it were combated, and, the large meeting to whom it was read seemed to think, satisfactorily. The doctor in conclusion, showed how he was led to the study of the subject by its connexion with the physiological and medical question of the duration of human life; and, urged by his thorough convictions of its

complete adequacy to the end in view, was anxious to make the great value of the practice more generally known and had recourse to than it is in our community.—[Glasgow Herald.]

**CHARLES LAMB.**—It is with a feeling of the deepest pain and sorrow that we have to record the death of this friend and benefactor of humanity. Charles Lamb, the fine-minded and noble-hearted Elia, expired at his house at Edmonton on the morning of Saturday last. His death was rather sudden, and we greatly fear that it may have been hastened by an accident which he met with a few days before. While taking his customary morning walk along the London road his foot slipped, and he fell, striking his face against some stones, so as to wound it severely. He was recovering, however, when we heard of him, (on Christmas day,) and as full of jest and whim as ever. Mr. Lamb sustained a severe shock in the loss of his, perhaps, oldest and dearest friend, Coleridge—to whom he so recently paid the last tribute of mortality—with whom he has been so soon re-united. All love and honor wait upon the memory of the friends! No man was ever more loved and honored in life than Chas. Lamb; his audience was fit, though few. His exquisite humor, his refined and subtle thought, his admirable critical powers—the fancy, the feeling, the wit that gave a character to his essays quite unique—

"All were but ministers of love,  
And fed his sacred flame;"

that love which embraces humanity—the sympathy that encircles the whole family of life. Mr. Lamb was, we believe, in his sixty-first year. He has left a memory to which years will but add grace and lustre.

**Irish Cottage.**—"Tell me of the cottage, Laggan." "God bless you, Ma'am dear, you're cruel fond of hearing of cottages; sure the history of most of them in this country is alike;—a wedding, and little to begin with—a power of children, and little to give them—rack-rent for the bit of land, turned out, bag and baggage, for what or the title!—beggary, starvation, sickness, death! That's a poor Irishman's calendar since the world was a world, barrin here and there, now and then, when he gets a sight of good fortune, by mistake!"—[New Monthly Magazine.]

**Leave Me Not Yet.**

Leave me not yet!—through rosy skies from far,  
But now the song-birds to their nests return!  
The trembling image of the first pale star  
On the dim lake but now begins to burn,  
—Leave me not yet!  
Not yet!—low voices borne from hidden streams,  
Heard through the shivery woods, but now arise,  
Their sweet sounds mingle not with daylight dreams,  
They are of vesper's hymns and harmonies:  
—Leave me not yet!  
My thoughts are like those gentle tones, dear love!  
By day shut up in their own still recess,  
They wait for dew on earth, far stars above,  
Then to breathe out their voice of tenderness:  
Leave me not yet!

**TOWNSEND & DUFFEE**, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (with-out-splice) for Inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. R. Co. Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania.  
Hudson, Columbia county, New York,  
January 29, 1835.

**RAILROAD CASTINGS.**

**MANY & WARD**, Proprietors of the Albany Eagle Air Furnace and Machine Shop, will make to order car wheels, chairs and knees, and every other description of castings required for railroads. R-1y feb14

**PATENT HAMMERED SHIP, BOAT, AND RAILROAD SPIKES.**

Railroad Spikes of every description required, made at the Albany Spike Factory.  
Spikes made at the above Factory are recommended to the public as superior to any thing of the kind now in use. Ship and Boat Spikes made full size under the head, so as not to admit water.  
Orders may be addressed to Messrs. ERASTUS CORNING & CO., Albany, or to THOMAS TURNER, at the Factory, Troy, N. Y. sept.18-1y

**STEVENSON,**  
Builder of a superior style of Passenger Cars for Rail-roads,  
No. 224 Elizabeth street, near Bleecker street,  
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad now in operation. J38 1f

**RAILROAD CAR WHEELS AND BOXES, AND OTHER RAILROAD CASTINGS.**

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to.  
Also, CAR SPRINGS.  
Also, Flange Tires turned complete.  
J8 ROGERS, KETCHUM & GROSVENOR.

**RAILWAY IRON.**

25 tons of 1 inch by 1 inch, Flat Bars in lengths of 200 do. 11 do. 13 to 16 feet, counter sunk  
40 do. 11 do. do. holes, ends cut at an angle  
800 do. 8 do. do. of 45 degrees, with  
800 do. 4 do. do. splitting plates and nails to suit.  
1200 do. of Edge Rails of 26 lbs. per yard, with the requisite chairs, keys and pins.  
Wrought from Mills of 20, 22, and 26 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.  
Axles of 24, 26, 28, 30, 32, 34, and 36 inches diameter for Railway Cars and Locomotives of patent iron.  
The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment. A. & G. RALSTON.  
9 South Front street, Philadelphia.  
Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them. d7lmsowr

**SURVEYORS' INSTRUMENTS.**

Compasses of various sizes and of superior quality warranted.  
Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by  
E. & G. W. BLUNT, 154 Water street,  
J31 6t corner of Maiden Lane.

**SURVEYING AND ENGINEERING INSTRUMENTS.**

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new, among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also a Railroad Goniometer, with two Telescopes—said a Leveling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.  
WM. J. YOUNG  
Mathematical Instrument Maker,  
No. 9 Dock st., Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.  
Baltimore, 1832.

In reply to thy inquiries respecting the instruments manufactured by these, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sight, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,  
JAMES F. STABLEY, Supt of Construction  
of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.  
Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.  
E. H. GILL, Civil Engineer.  
Germantown, February, 1833.

For a year past I have used instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level. I consider these instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.  
Germantown, and Norrist. Railroads  
ml ty

MAN is the minister and interpreter of nature, said a great philosopher; and he ought unquestionably to commence the study of the important science of nature by becoming acquainted with his own species in every form of existence, and in every stage of society, from the erratic savage of the forest to the polished inhabitant of the city. In this country we behold man in every shape and modification of insulated and social being. When we peruse Herodotus' description of the Scythians, Thucydides' of the ancient Grecians, Cæsar's of the Gauls and Britons, and Tacitus' of the Germans, we perceive the prototypes of our Indians; but we have it in our power to view man in a savage state with our own eyes, without relying on the reports of others; and it is to be regretted that so much time has transpired, without more attention being bestowed on this interesting subject. Dr. Robertson says, 'almost two centuries elapsed after the discovery of America, before the manners of its inhabitants attracted, in any considerable degree, the attention of philosophers.' This neglect can, perhaps, never be fully retrieved. An intercourse with civilized man has changed our Indians in almost every respect; but there is still a sufficient remnant of their manners, languages, and traditions, left to interest inquiry, and invite investigation. In some very remote quarters, they may still be found in the unsophisticated forms of original barbarism, unaltered by extrinsic intercourse. Many of their languages may still be redeemed from oblivion, their persons may be delineated, and their manners and traditions may be described; and the knowledge which may be obtained, added to what has already been collected, may furnish invaluable illustrations of the human species. The number of languages in Mexico is thirty-five, of which fourteen have grammars and dictionaries. The Bible has been translated by Eliot, the Indian apostle, into the Algonquin language; and two thousand copies of the Mohawk version of St. John's Gospel have been printed by the British and Foreign Bible Society; and we have many collections of words in different Indian languages. Our antiquities are of two kinds, such as relate to the aboriginal and colonial states. We have no Indian monuments or curiosities that can be compared with the forts on the Ohio, or with the temples of the Aztecs. There are some remains of Indian pottery, of weapons, and of rude paintings. Mounds of earth, like the tumuli in Scandinavia, Russia and Tartary, the barrows in England, and the cairns in Scotland and Ireland, may still be seen, and also the outlines of extensive fortifications. But the variegated condition of the white man here exhibits human nature in all its shapes. We behold him in every stage of society, from the semi-savage hunter to the polished citizen; and we perceive every stage of cultivation, from the first tree that was cut to the elegant habitation. 'In North America,' says a distinguished writer, 'a traveller who sets

out from a great town, where the social state has attained to perfection, traverses successively all degrees of civilization and industry, which keep diminishing, till he arrives, in a few days, at the rude and unseemly hut formed of the trunks of trees newly cut down. Such a journey is a sort of practical analysis of the origin of nations and states. We set out from the most complicated union, to arrive at the most simple elements. We travel in retrogression the history of the progress of the human mind, and we find in space what is due only to the succession of time.'—[Scientific Tracts.]

**MECHANICS' MAGAZINE**, Nos. 1 and 2 of VOLUME 5, for JANUARY and FEBRUARY, 1835.—The two first numbers of volume 5 are now published and for sale at 35 Wall street, and at the principal bookstores. These numbers contain a great number and variety of articles, both useful and entertaining; and are printed in a style altogether superior to any of the preceding numbers of the work, and no efforts will be spared to render the work equal to any other of the kind published.

Bound or stitched volumes may be had single, or in complete sets, at the office No. 35 Wall street, of

D. K. MINOR.

**RAILROAD AND CANAL MAP.** HIS long promised Map is now ready for those who wish it. Its size is 34 by 40 inches. It is put up in a convenient pocket form, in morocco covers, and accompanied by over 70 pages of letter press, giving a concise description of, or reference to, each Road and Canal delineated on the Map. It will also be put up in *Marble Paper* covers, so as to be forwarded by mail to any part of the country; the postage of which, cannot exceed 44, and probably not 25 cents, to any part of the country.

Published at 35 Wall street, N. Y., by

D. K. MINOR.

**AGENTS FOR NEW PUBLICATIONS.** HENRY G. WOODHULL, of Wheatland, Monroe county, New York, is agent for the following Publications: The New York American Daily, at \$10.00—Tri-Weekly, at \$5.00—Semi-Weekly, at \$4.00 in advance. The American Railroad Journal, Weekly, at \$3.00 per annum. The Mechanics' Magazine, two volumes a year, at \$3.00 per annum. The Quarterly Journal of Agriculture and Mechanics, at \$5.00 per annum, or \$1.25 per number. The Family Magazine, 416 pages a year, at \$1.50 in advance. The Monthly Repository and Library of Entertaining Knowledge, of 36 pages a month, at \$1.00 in advance, now in the 5th volume, bound volumes \$1.25. The Ladies' Companion, of 54 pages a month, at \$3.00 per annum, in advance. The Rochester Gem, at \$1.50 in advance. All Communications addressed to me, at Wheatland Monroe county, will be promptly attended to. September 19, 1834. *W. THORNTON.*

#### SUPERIOR GARDEN AND AGRICULTURAL SEEDS.

The Subscriber has now on hand a full supply of Garden and Field Seeds, growth of 1834; among which are all the finest cabbages, cauliflower, broccolis, radishes, peas, &c., that are cultivated in England, France, and Holland, together with every sort that can be raised to advantage in our own country, and which are grown expressly for my use from stock furnished and raised by the most experienced gardeners in this country; in short, every article emanating from my store, I warrant genuine and fresh.

Also, skinless oats, potatos oats, 44 lb. weight to the bushel, perennial rye grass, white clover, lucerne or French clover, orchard grass, Herd's grass, white mulberry, and yellow locust seeds, spring tares or vetches, genuine mangel wurtzel, and ruta bage, and field turnip seeds, well worth the attention of farmers.

Canary, Hemp, Rape and other bird seeds; wholesale dealers supplied on accommodating terms. Price lists by the pound and bushel furnished on application, as also catalogues of whole collection.

The flower seed department embraces the choicest variety to be found in this country, in which are included choice double double Dahlias seed, carnation and choice Pinks, German and China Asters, splendid double balsams, with an addition of several new varieties, accompanied with a printed direction for culture and management.

Orders will be punctually attended to and carefully packed and forwarded as directed, but as the collection of distant debts are often troublesome and sometimes impracticable it is desired that satisfactory reference be made to person in Albany, when the order is not accompanied with the money.

347 N. Market st. (opposite Post Office)

\* Mr. Thornton is also Agent, and will at all times receive subscriptions, for the New York Farmer and American Gardener's Magazine; QUARTERLY JOURNAL of Agriculture, Mechanics, and Manufactures; MECHANICS' MAGAZINE and Register of Inventions and Improvements; and the AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; published at No. 35 Wall street, N. Y., by D. K. Minor.

**LAFAYETTE.** THE Eulogy by JOHN QUINCY ADAMS, on the Life and Services of this Benefactor of Mankind; on a beautiful paper and type; with a spirited medallion *penetrating likeness*. Is just published and for sale by

D. K. MINOR, 35 Wall st.

#### NOTICE TO MANUFACTURERS.

**SIMON FAIRMAN**, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for shins. The nails so hammered and come from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.

August 15, 1835. *ASDUFMAF*

#### PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keeps constantly for sale every extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent), are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are furnished with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1831.

Spikes are kept for sale, at factory prices, by I. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. I. Brower, 323 Water street, New-York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

P. S.—Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes.

1252am H. BURDEN.

#### MILL DAM FOUNDRY FOR SALE.

The Proprietors of the Mill Dam Foundry offer for sale or lease, their well known establishment, situated one mile from Boston. The improvements consist of

No. 1. *Boiler House*, 50 feet by 30 feet, containing all the necessary machinery for making boilers for Locomotives and other steam Engines.

No. 2. *Blacksmith's Shop*, 50 feet by 30, fitted with cranes for heavy work.

No. 3. *Locomotive House*, 54 feet by 25, used for putting together Locomotive Engines. Several of the best Engines in use in the United States have been put in this establishment.

No. 4. A three story brick building, covered with slate, 190 feet by 45, containing two water-wheels, equal to 40 horse power; Machine Shop, filled with lathes, &c.; Pattern Shop; Rolling Mill and Furnaces, capable of rolling 4 tons of iron per diem, exclusive of other work; three Trip Hammers, one of which is very large; Engine for blowing Cupola Furnaces, moved by water-wheel; one very superior 18 horse Steam Engine, which could be disposed with; and a variety of other machinery.

No. 5. An Iron Foundry, 60 feet by 45, with a superior air Furnace and two Cupolas, Coxe oven, Cranes, &c. fitted for the largest work. Attached to the Foundry is a large ware-house, containing Patterns for the Castings of Hydraulic Presses, Locomotive and other Steam Engines, Lead Mill Rolls, Gearing, Shafts, Sproves, Grates, &c. &c. These were made of the most durable materials, under the direction of a very scientific and practical Engineer, and are supposed to be of great value.

No. 6. A building, 35 feet by 36, containing a large stock of chimneys, and furnaces, for making Cast Steel. This building is at present used as a boarding-house, and can accommodate a large number of men.

No. 7. A range of buildings, 300 feet long by 36, containing counting room, several store rooms, a Brass Foundry, room for cleaning castings, a large loft for storing patterns, stable for two horses, &c. &c.

The above establishment being on tide water, presents greater advantages for some kinds of business than any other in the United States. Coal and Iron can be carried from vessels in the harbor of Boston, to the wharf in front of the Factory, at 25 to 30 cents per ton. Some of the largest jobs of iron work have been completed at this establishment; among others, the great chain and lift pumps for freeing the Dry Dock at the Navy Yard Charleston.

The situation for Railroad work is excellent, being in the angle formed by the crossing of the Providence and Worcester Railroads. The Locomotive "Yankee," now running on the latter road, and the "Jonathan," purchased by the State of Pennsylvania, were built at these works. With the Patterns and Machinery now in the premises, 12 Locomotives and as many tenders, besides a great quantity of cars and wagons, could be made per annum.

For terms, apply to THOS. J. ECKLEY, Treasr. &c., Boston, or to ROBERT RALSTON, Jr., Philadelphia. Boston, Dec. 30, 1834.

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, FEBRUARY 25, 1835.

**NEW-YORK AND ERIE RAILROAD.**—This subject has been, we perceive, made the special order of the day for Tuesday next. We are gratified to find that this road is becoming one of more interest to the people at large, and especially so to the present legislature. It is truly one on which intelligent and liberal men can hardly disagree. It is one which will serve as a further facility to induce our western neighbors to make the State of New-York the route of their travel, and the city of New-York the great mart for their produce, and the source from whence to derive those immense amounts of merchandise which will be required to supply the millions of inhabitants which will, in a few years, inhabit the Territory between the Lakes, the Ohio river, and the Rocky Mountains—which is, in truth, the garden of the world. We have neither space nor time in this number to enumerate all the advantages to the public in general, and to this city and state in particular, which must result from the early completion of this work. The New-York and Erie Railroad should be made a link in the great thoroughfare to New-Orleans; and by a liberal course on the part of the State towards the company now holding the charter, it must become so. If, however, obstacles should be thrown in its way, and its construction should be delayed until the James River & Kanawha, (Va.) improvement, the stock of which is, we believe, all taken, and one-fifth of it by the State, shall be constructed, and the New-Orleans & Nashville Railroad, a survey of which is now being made by Mr. Ramsey, formerly of the Lexington & Louisville, Ky. Railroad, shall also be completed,—and they will

unquestionably both be speedily accomplished,—when only about 400 miles of road, between Kanawha and Nashville, Tenn., will be required to complete the great line of communication from New-York to New-Orleans, by the way of Virginia, Kentucky, and Tennessee, instead of, as every New-Yorker would desire, through the state of New-York by the New-York and Erie Railroad, around the corner of Lake Erie to Cleveland and Sandusky, Ohio, and by the Mad river railroad to Dayton; thence through a corner of Indiana and Louisville, Ky., to Nashville, Tenn., there connecting with the road to New-Orleans; we may long look in vain for another opportunity equally favorable to secure the Western trade. The distance from the termination of the New-York and Erie road to Nashville, Tenn., is about 675 miles, mostly through a level country, abounding with cheap materials for a road, and which will furnish abundance of business for the road when completed.

This is but a faint outline of the picture which might be drawn by an abler pen. Absence and other engagements prevent us from enlarging upon it, or filling it up. We shall endeavor, however, to show more clearly in our next number, if possible, the importance of prompt action by our Legislature to aid in the construction of a work, which, to the State, and more especially to the city, of New-York, is of vital importance—one to which, we doubt not, every enlightened representative in her Legislature, or friend of the State at large, will be found friendly and ready to urge its early construction.

**NAVIGATION OF THE OHIO.**—In the competition for the trade of the great West, every fact relating to the advantages which other States may have over us, by reason of their earlier and more uninterrupted means of communicating with that region, becomes important to be known. In this point of view, we look upon the annexed extract from the Pittsburg (Pa.) Gazette, showing the average period during a series of years, in which navigation on the Ohio was suspended, either by ice in winter, or low water in summer.

Facts such as are here stated, afford the strongest arguments that can be advanced in favor of the New-York and Erie Railroad, by which at all seasons the intercourse between this city and

the lake (and, if the road should be constructed to Nashville, Tenn.,—as it most certainly should, and surely will be,—between this city and New-Orleans) could be kept up; and the termination of which at the lake, both by its more southerly position and the peculiar formation of the lake itself, would ensure an earlier and later navigation by some weeks than can be had from Buf.

[For the extract above referred to, see p. 117.]

**PITTSBURGH, Feb. 19.**—*The River.*—Some time during last night the ice in the river was broken up, and is now rapidly disappearing; it gives us pleasure to state that the disruption was very gentle, and that not the slightest injury, except, perhaps, the rubbing off a little paint, was done to any of the steam boats now lying along our shore. Several of the steam boats have already commenced taking in loading, and navigation will commence to-morrow; or at the farthest, next day, the 20th or 21st instant.

**PRIMARY GEOLOGY.**—Dr. Boase is the author of a work expressly devoted to an examination of the *older formations*, or primary geology. From the few extracts and notices made of it abroad, it is certain of being received favorably by geologists in this country. The world was very slow in its progress towards its present condition; every object on which the philosopher fixes his eye, proves to him by incontrovertible evidence, that all this beautiful apparatus of vegetable and animal organization was a long time in being developed. The globe was in no condition for the present races of animals much longer ago, if any, than six thousand years. Traces of those constructed for existing on the earth in its primitive state are found imbedded in the rocks, to show us what has been. Certainly the forms of animals diminish in complexity of structure and in numbers, as we go back in the series, till they are actually lost in the granites.

A stage driver between Boston and Medford named Joseph Wyman, has just completed thirty years since he commenced running a stage between those two places. During the whole of that time he has never lost a trip by illness; never met with an accident, or lost a horse.

[From the London Repertory of Patent Inventions.]

**A Method of Working the Slides and Valves of Steam Engines when using Steam expansively.**

A new method of working steam engines of the ordinary construction expansively, in which the time of cutting off the steam is regulated by the governor, is shown in fig. 1, which is a side view, in which some of the parts are seen in section, and in fig. 2, which is an end elevation of the cylinder, and nozzles and the gearing for working the valves. In both figures the same letters are placed beside the same parts.

The brackets into which the gudgeons, *a, a*, of the rocking shaft work, are bolted to the cistern; these brackets, the weights that balance the valves, and some other things are not drawn, in order that the new parts may be seen distinctly. *b, b*, the shaft which works the cut-off valves, moves in two levers, *c, c*, which are keyed on the rocking shaft. The governor makes the same number of revolutions as the crank shaft, and the wiper *d*, and the other parts connected with it, work the cut-off valves in the following way. Part of the governor rod is turned cylindrical, and there is one or more threads of a screw (which makes one revolution in about twenty times its diameter), raised upon it at this place; and the piece *f*, is bored, and it has a thread or threads cut into the hole, so that it may work easily upon the turned part of the governor rod, with the screw raised upon it. The outside of *f* is fitted into a hole bored through the wiper, in the very same way as the governor rod is fitted into the hole in *f*, only the screw should be raised in the eye of the wiper, to allow the collars that are fixed above and below it, to prevent it from rising or falling, to be as small in diameter as possible; as this will diminish the friction on the ends of the wiper, it will be more easily acted on by the governor. *e, e*, are friction rollers, and the parts *g, g*, of the frame that holds them, slide backwards and forwards in brass guides. The rod, *h*, communicates the motions of the frame to the lever, *i*, (shown by dotted lines in the elevation,) which gives motion to the shaft, *b, b*, on which the levers, *l, l*, are fixed; and these levers move the rod which works the cut-off valves, by means of the cross head, *s*, and the side rods, *o, o*. The rods, *n, n*, must have ball and socket joints, to allow their bottom ends to turn round, as they work the part, *f*, up and down.

The screw that connects the inside of *f* to the governor rod, should wind in a different way from the screw that connects the outside of *f* to the wiper. Both screws are drawn on the same side in the elevation, but they should be on opposite sides, as in fig. B, which is a ground section of some of the parts now described.

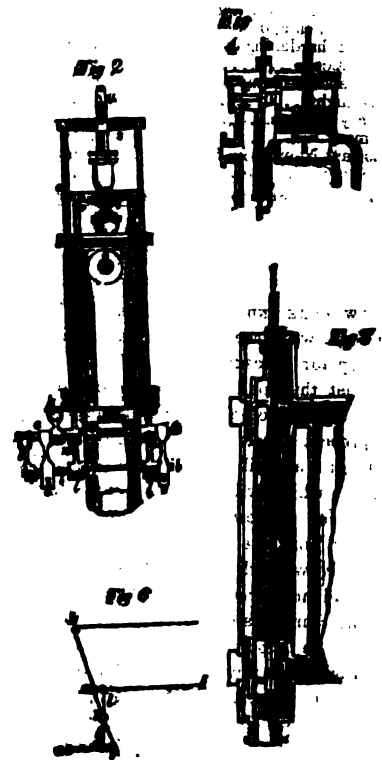

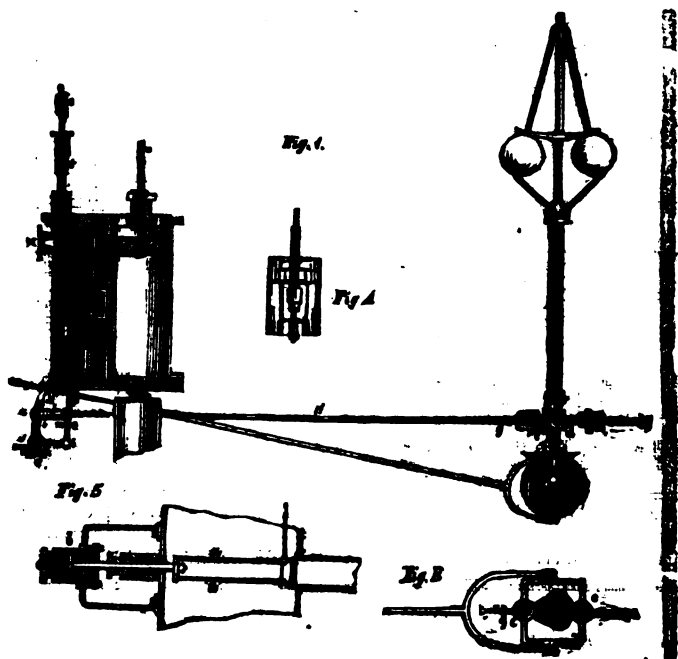

As the screw cut into the outside of *f* has its lateral direction as it winds downwards, the same as the motion of the wiper, the friction on the under collar will assist the governor to turn the wiper backwards, and the weight of the wiper

will diminish the friction on the upper collar, when it (the wiper) is turned in the opposite direction. The collars, and the brackets to which they are fixed, are not drawn, as they would have the part *f*. *k* is the lever into which the rod from the eccentric works. By following out the remaining letters in both figures, the positions, &c. of the other parts will be known. The levers, *m, m*, are loose on the rocking shaft: their use is to keep away a motion of the cut-off valves that would take place if their side rods were connected immediately to the levers, *l, l*.

By inspecting the section of the valve in fig. 1, and the back view of it in fig. A, it will be seen that the construction is that of the short slide valve, with an additional piece or box without back or front cast on each end, of the same length and breadth as the steam-ways, and it will also be seen, that these additional parts could make no difference whatever in the working of the engine, unless the face of the nozzles on which the valve slides, prevented steam from entering in at the front of the additional box that is next the steam end of the cylinder when one of the small cut-off valves (shown also in the same figures) covered the back part of this box. The rod which works the cut-off valves passes through the centre of the valve rod, which has a stuffing box at the top. In fig. A the two small rods are shown, which connect the two cut-off valves.

The manner in which the governor acts on the wiper so as to regulate the motion of the engine, will be understood from what follows. The wiper, *d*, must be so placed when the engine is working with the governor balls down, that it will work the cut-off valves, so that one of them will cover the additional box through which the steam is passed into the cylinder, exactly at the termination of the stroke of the piston; in this position of the balls, the engine is working slow, and it has the full pressure of steam du-

ring the whole length of the stroke, to bring up its motion. If the screws on the down end of the governor rod, and in the wiper, wind in proper directions when the balls move outwards, the wiper will be turned forward from its aforementioned position, and it will cut off the steam nearer to the commencement of the stroke. This will keep the engine working at about the same velocity, whether the load upon it is great or small, unless it is overburdened. When the wiper has made about half a revolution from its position on the governor rod when the balls are down, the balls are as far up as they can get, and the steam will be cut off at the very commencement of the

stroke, so there is no danger of the engines running away.

There is no pressure of steam, and in consequence of this there is very little friction on the cut-off valves when they are working: because, the box on the end of the slide valve that the cut-off valve is upon, is always so far past the termination of the face on the nozzles, that the steam is admitted to both sides of the cut-off valve that is moving off the box. This will be better understood by inspecting figures 1 and 3, where it will be seen that the terminations of the face on the nozzles are exactly in a line with the inside of the extreme ends of the additional boxes, when both steam-ways are covered by the slide valve; and as the faces on the back of the slide valve on which the cut-off valves work are raised above the back of the valve, there can be no pressure of steam on the valve that is open, to hinder its motion.

The movements of the rocking shaft cannot alter the position on the slide valve that the cut-off valves are put into by the wiper, *d*, on account of the end of the lever, *i*, into which the rod, *h*, from the wiper works, never being very far distant from the centre of motion of the rocking shaft. It would not do to let the shaft, *b*, *h*, work in fixed brackets, because the slide valve is always in motion and the cut-off valves would have no corresponding motion to keep them at their places on the slide valve.

As the extremities of the wiper are composed of circles drawn from the centre of the governor rod, the wiper will be very easily moved by the governor, when the circled parts are passing the friction rollers, for the friction of the wiper on the rollers at that time will be nothing, because the rollers are set just so far apart as not to touch the extreme parts of the wiper.

The stroke of the cut-off valves is very short, and the ruffs on the parts, *g*, *g*, regulate its length. When the shaft that works the cut-off valves is placed (as in figs. 1 and 2) under the rocking shaft, the rod *h* rests upon the top end of the lever, *i*, and its weight keeps the friction rollers from bearing upon the extreme or circular parts of the wiper, by bringing the frame to bear upon two of the ruffs of the parts, *g*, *g*.

As the screw feathers, that form the connection between the governor rod and the wiper, make only one revolution in about twenty times the diameter of the parts screwed, no power applied to the end of the wiper can turn it without taking the governor rod along with it, but the least power from the governor will cause the wiper to revolve on the rod.

If the wiper is made long enough, and its top end connected to the rods, *a*, *a*, there is no use for the intermediate part, *f*. In this case the friction rollers must have no flanges, and the wiper will rise or fall twice the distance that the part, *f*, rises or falls.

In fig. 3, a similar kind of cut-off valve is applied to the common, D, valve, as in

figs. 1 and 2. The end of the top education pipe is shown by the darkened circle, and the flanged branch at the top of the nozzles is under the education pipe. The steam pipe is on the side of the nozzles that is cut away, but its form and position are given by the dotted lines. Only a part of the cylinder is drawn.

Round slide or piston valves may have a smaller piston working inside of each valve to cut off the steam.

In what is termed the leech slide valve, the cut-off valves instead of sliding may work on hinges like a common foot or discharge valve. The cut-off valves in this case will be up or down when they are open, and their position when shut will be nearly a horizontal one.

The diagram (fig. 6) gives a very simple arrangement of the rods and levers for working the slide and cut-off valves in a horizontal engine. In this figure the same letters are placed beside the same parts as in figs. 1 and 2.

By applying the apparatus described in the above plans to a steam engine without a governor, its power may be altered without stopping it, by having a rod and handle connected to the part *f*. When no governor is required, it will be simpler to have the wiper, *d*, upon the crank shaft.

A cut-off valve, placed betwixt the top steam valve, and another one placed betwixt the bottom steam valve and the boiler, if they were wrought by a wiper, as shown in figs. 1 and 2, would work well if the pressure of the steam was not upon the valves when they are opening. Valves constructed like the one shown in fig. 4, are well adapted for this and other purposes: the rod that works the valve is seen at *c*; *a*, *a*, are the rods that support the principal part of the pressure, and the rod, *d*, goes down the steam pipe to work the cut-off valve at the bottom. Fig. 5 is a plan of the valve on a large scale: in order to adjust it to its seat, cork, or some other substance that will spring a little, is put into the box *b*. The pressure may be on any side of a valve of this sort; if the pressure is on the same side of the valve with the rods, *a*, *a*, the joints of these rods may be left the least thing loose: in this case the method of adjusting the valve by means of cork is not necessary. The snug on the top of the valve seat, for the end of the valve to rest on, is only wanted in particular cases.

For slide valves, the plans given in figs. 1, 2, and 3, are best adapted, and for conical valves, the plans shown in figs. 4 and 5 may be adopted.

In the plans that are described in this letter for cutting off the steam at any portion of the stroke of the steam engine, the number of motions of the parts are one half less; the action required from the governor to turn the wiper is not so great (as the wiper never moves parallel to the axis of the friction rollers), and it is more uniform; and the steam is cut off nearer to the cylinder than in Messrs. Maudsley and Field's plan. Mr. Tredgold's method of work-

ing, by jerks, heavy slide-valves, that are either firmly packed, or else have a great pressure of steam upon them, is certainly not a good one, even if the time of cutting off the steam could be regulated by the governor. To persons who understand perfectly the old and the new methods, other advantages in the new over old plans, besides those now enumerated, will present themselves.

Shifting a wiper round to any position on its shaft, by means of a screw-feather, may be used to advantage in many mechanical arrangements besides the above.

I should have mentioned before, that the smaller of the two circles, which nearly circumscribe the wiper, *d*, must be a semi-circle; and I should also have noticed, that cutting off the steam at one end of the cylinder, opens the cut-off valve at the other end always soon enough to give the engine steam at the beginning of the next

By giving in your valuable journal much

SLAW.

Glasgow

P. S.—

happens not that the engines exist in the annexed sketch, in which *a* is the pipe

gh [per] ig steam the an-

leading from the boiler, and the ends, *b*, and *c*, of the pipe *b*, *c*, go, the one to the top, and the other to the bottom steam valve. If a plunger, *d*, which fits the pipe, *b*, *c*, exactly, be wrought up and down past the pipe, *a*, by means of a common eccentric, it (the plunger *d*) will cut off the steam at any portion of the stroke, by shifting the eccentric round on its shaft. By lengthening the faces of the cut-off valves, or by making a slip joint on the rod that works them, an eccentric may be used in any of the above plans, if it is shifted by hand, to its right position on its shaft.

By a trifling modification of the gearing for working the valves, the plans given in this letter may be applied to almost every form of the steam engine.

CAMDEN AND ANNETT RAILROAD.

Extract of a letter dated Trenton, Feb. 17th, 1836.

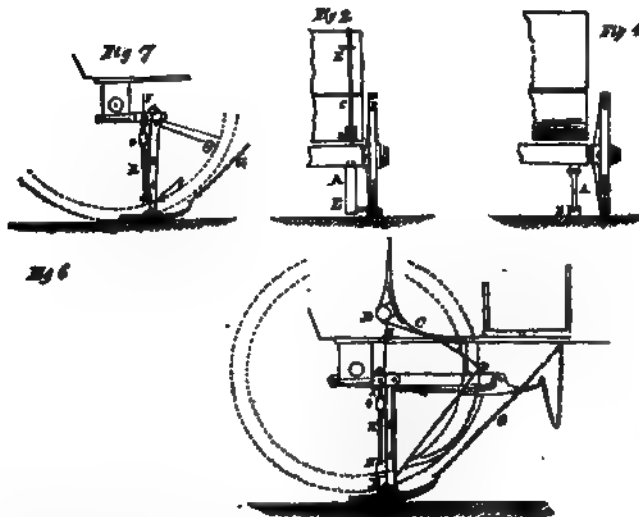

"This afternoon the following resolution was called up in the Council on its final passage, and carried by a vote of 11 to 2:

"Resolved," That the passage of any act by this Legislature, authorizing or recognising any other railroad across this state, which shall be intended or used for the transportation of passengers or merchandise between Philadelphia and New York, would be unjust, impolitic, in violation of the faith of the state, and deeply injurious to its interests.

## REES' IMPROVED CARRIAGE-DRAG.

Fig 1

Fig 3

[From the Repository of Patent Inventions.]

*Specification of the Patent granted to DAVID REES, of Brecon, South Wales, Woollen Manufacturer, for Improvements on Drags or Apparatus to be applied to Carriages.*—Sealed August 7, 1833.

To all to whom these presents shall come, &c. &c.—Now know ye, that in compliance with the said proviso, I, the said David Rees, do hereby declare that the nature of my said invention, and the manner in which the same is to be performed, are particularly described and ascertained in and by the following description thereof, reference being had to the drawing hereunto annexed, and to the figures and letters marked thereon, (that is to say):

Figs. 1 and 2 represent a side view, and so much of a carriage as is necessary to exhibit the application of my improved apparatus which consists of a drag. In the side view the drag is attached, in a working position, as having shod the wheel which does not require to have the progress of the vehicle impeded, to render it beneficially useful. A is the frame attached to the axle-tree of the carriage; B, the shoe; C, the strap, or chain, which is attached to the frame at E, passing over the friction pulleys, D, D, to the fixed catch, F, at the back of the carriage, where it is made fast by the coachman or guard; G is the drag-chain. The apparatus when out of use will assume the position under the carriage as shown by the drag and appendages in red color.\* To put the apparatus in motion, the driver or guard of the coach has only to slip the strap or chain off the catch, F,

\* Shown by dotted lines in the engraving.

and it will of itself fall down into action as represented.

Figs. 3 and 4 are similar views of another construction of drag, intended to raise the wheel and support the carriage, so that it may diminish the speed of the vehicle going down declivities. In all the figures, similar letters distinguish the respective parts. A is the frame; B, the skid; C, the strap or chain which is attached at E, passing over the pulleys, D, D, to the fixed catch, F, on the front of the coach, where it is as in the before-described figure made fast by the coachman or guard.

Figs. 5 and 6 are a side and back view of another description of drag, constructed for the purpose of being drawn up whilst the carriage is in motion. These figures are drawn to represent the apparatus in operation in the same manner as before described. The manner of effecting this will be seen on reference to fig. 7, which exhibits a side view of the drag with the catch, H, unlatched; to unlatch this catch, it is only necessary for the driver or guard to pull the strap, I, attached to the eye of the lever, K, as seen in fig. 6, when it becomes sufficiently removed to allow the catch to liberate itself from the latch, L, which is kept down in position by the spring, M. The guard or staple plate, O, is intended to retain the lever in its proper situation. Upon removing the catch by the means described, the wheel of the carriage again comes in contact with the ground to support the vehicle, and the drag may be taken up to the position shown in red color\* under the body of the carriage. Now, whereas it is evident by the foregoing

\* Shown by dotted lines in the engraving. ]

ing description, that my improvements on drags or apparatus to be applied to carriages are applicable to every description of wheeled carriages, only varying the length and substance according to the diameter of the wheels, and weight of the carriage; and I therefore claim as my invention the application of the whole of the above combination as herein represented and described, without limiting myself to the use of any particular material.—In witness whereof, &c.

Enrolled January 7, 1834.

[From the Journal of the Franklin Institute.]

*Note relating to the hardening of Lime under Water, by the action of Carbonate of Potassa, &c., and to the hardening of Carbonate of Lime in the Air, by Potassa and Soda.* By A. D. BACHE, Prof. of Nat. Philos. and Chem., Univ. Penn.

The following experiments were made more than eighteen months since, and were suggested particularly at the time by the article of Professor Emmett, on the solidification of raw gypsum in the air, by the action of the alkali, potassa, and of certain of its salts. They commenced with an examination of the effect of certain salts of potassa and soda, and of caustic soda, on the hardening of carbonate of lime, and of common lime, in the air; and, by a natural transition, to a more interesting subject, the effect of these, and of other materials, on the hardening of lime under water. Not having leisure to prosecute this subject, I am induced to publish the results already obtained, that by attracting the attention of some one who may be favorably situated for carrying out the course of experiment which they suggest, it may be carried forward to completion. The conclusions cannot fail to be of interest, both in a practical and theoretical point of view.

It is well known that certain impure limestones yield, when calcined, a lime which hardens under water, technically called hydraulic lime. Experimenters, who have examined these limestones, with a view to determine the ingredient giving this hydraulic property, have not agreed in their conclusions; the essential ingredient has been in turn supposed to be silica, alumina, oxide of iron, and oxide of manganese. My friend, Col. Totten, informs me that Col. Troussat, in a recent work on mortars, attributes this power of conferring hydraulic properties upon lime, in certain cases, to soda—an ingredient which, before his examination, had not, I believe, been detected in any hydraulic limestones.

The method of ascertaining the effect of the substances experimented upon, in causing lime to harden under water, was similar to that employed by Raucourt, and described in his work on mortars. The mixture having been made, and brought to a paste of a proper consistency, was placed at the bottom of a glass vessel, and water poured gently upon it. A wire stem, terminated at

one extremity by a wooden disk, was placed vertically upon the mixture in the vessel, and the weight ascertained which was required to pierce the mass; the hole thus made being filled up, by tamping the mixture with a blunt stick, it was allowed to remain exposed to the action of the water for any desired length of time, and then subjected again to a similar trial.

As almost all common lime is slightly hydraulic, an examination of that to be used in the experiment was first made; having been slaked, and, when made into a thick paste, placed at the bottom of a wine-glass, and water added, the test stem was applied, the mixture having set, bore 1 oz. troy upon the head of the stem; after an exposure of one day, the mass bore 1½ oz.; and after two days, bore 3½ oz.; it had then been so far disturbed, that it would not resume its cohesion.

This common lime was thus shown to possess feeble hydraulic properties. When mixed with sand and water, so as to form a tolerably rich mortar, the mass, after it had set, bore 5½ oz. on the rod, and, after two days, 7 ounces, which was the maximum weight borne. In its mixture with sand, this lime formed a mortar which was feebly hydraulic.

Some of this lime was mixed with caustic hydrate of soda, which, however, had a portion of adhering carbonate. The proportion of soda added was not particularly attended to; it was, however, much less in weight than the lime. The mass became so soft, that when, after tamping in the bottom of the glass, water was added, the test rod penetrated it freely. After one day, the mixture bore 4 oz. troy, upon the wooden disk at the top of the rod; after another day, 5½ oz., which was the maximum. It recovered this strength twice, by the interval of a day between the times at which it was disturbed by the penetration of the rod. Soda, it then appears, renders lime, to a certain extent, capable of setting under water.

Lime being made into a paste, with soda and water, acquired considerable consistency in the air.

When lime was made into a thick paste, with a solution of carbonate of soda, and exposed to the air, it crumbled into dust; this being mixed again with water, assumed consistency at first, but subsequently crumbled.

Lime did not set in the air, when mixed with a solution of sulphate of soda; the incoherent mass was pulverized, and re-set with water, which increased the cohesion, but not very materially. Under water, the paste of lime and sulphate of soda, four parts of lime by weight, and one of sulphate of soda, bore 9 oz.; but on the very next day lost its cohesion.

Carbonate of potassa, mixed with lime, in the proportion of six, by weight, of the salt, to two of lime, formed a mass which crumbled in the air; but, being re-set with water, assumed considerable cohesion.

This same mixture had hydraulic properties; for 4 oz. of lime, 2 of carb. potassa, and 11 oz. of water, being mixed and placed under water, bore, after two days' exposure, 64 oz., or 5½ lbs., which was all the weight which was at hand. A mass of the same mixture, which had been exposed to the air, and was but slightly coherent, being placed under water, became quite hard.

An attempt was made, by reducing the proportion of carbonate of potassa to about 12 per cent., to harden the lime in the air; but it did not succeed.

A curious effect was produced by soda, and by potassa, on carbonate of lime, reduced to powder, and, after mixture with alkali and water into a paste, exposed to the air. The carbonate became, in one case, harder than the original material, and in another, but little inferior to it in hardness; in the former case, the experiment was made upon chalk; in the latter, upon Carrara marble. The marble had very nearly the appearance of the original material, and a cast taken from it would have had a beautiful appearance, very different from the dull white of plaster of Paris. Neither of these mixtures was hydraulic; and when a mass of chalk and soda, which had hardened in the air, was placed in water, it was completely disintegrated.

I had, at the time of making these experiments, a quantity of silica, which had been prepared by passing fluo-silicic acid into water, and which, never having been heated, was still soluble, though, of course, in a small degree; after repeated washings, it still restored the red color of alkanet, which had been rendered purple by a feeble alkaline action. This silica was mixed with lime and water, so as to form a paste, and being placed under water, would not bear the weight of the test rod; it was exposed for four days, and was softer, at the end of the trial, than at the beginning.

[From the Pittsburgh Gazette of Feb. 20.]

NAVIGATION ON THE OHIO.—The editor of the Philadelphia Commercial Herald, some time since requested us to give some account of the times at which the navigation of the Ohio was usually interrupted by ice and low water, for some years past. We had intended to do so, but other matters have prevented it. The opening of the rivers yesterday has called our attention to it again, and we now perform that duty in part. Messrs. Jacob Forsyth & Co. have politely furnished us with their steamboat reporter, since 1829, from which we collect the following information.

This book commences on the 4th of August, 1829, and gives arrivals and departures from and to Louisville, Cincinnati, throughout August, September, October, November, and December, of that year, and through January, February, March, and the succeeding months of 1830, until the 14th of July.

The last arrival in January was the Talisman, on the 18th, and the last departure, the Lark, on the 19th. Probably about the 20th or 21st, the river was closed by ice, though the book does not state this. Subsequently we find the following note:—"River opened Feb. 20, 1830." From the 14th of July, and through the month of August, September, and October, there were no arrivals or departures. On the 23d November, 1830, navigation was resumed, and continued open until the 14th January, 1831, when it ceased. Subsequently we find this note:—"River opened 19th Feb., 1831. Boats continued

to arrive and depart until the 27th of September, 1831. The last arrival was the Versailles, on the 26th, and the same boat departed next day.

From that time, there were no arrivals or departures until the 10th November, when navigation recommenced. Afterwards we find the following note:—"River closed Dec. 4th, 1831." Then the following:—"Ice broke January 7th, 1832." Subsequently the following:—"Navigation again stopped with ice, January 26th, 1832." It continued closed, however, but a short time; for, on the 1st of February, the Talisman departed for Louisville; and, on the 2d, the Herald (a new boat) for Mobile.

From this time, steamboats arrived and departed with ordinary regularity, until the 29th of June—from that day, there was neither an arrival or departure until the 11th of August, when navigation recommenced, and continued until Sept. 4.

From the 4th of September till the 9th of November, navigation was suspended by low water. From the 9th November, 1832, there was no interruption until the 21st day of July, 1833, except from the 14th till the 19th Jan., that being the longest period in which there was no arrival or departure.

On the 21st of July, 1832, departed the steamboats Mount Vernon and Albion, being the last. There was then neither an arrival or departure until the 23d of September. From that day till the 1st of November, there were 13 arrivals and 19 departures. During the months of November, December, and up to the 3d of January, 1834, the navigation was brisk and active. Then we find the following notes:—"Monongahela river closed January 9th, 1834. Alleghany closed same day." Immediately below is the following note:—"Ice broke up, with high flood Jan. 12." From that date, until the 29th of July, navigation was regular and uninterrupted. During August and September, there was neither arrival or departure.

Then comes the following note:—"Navigation commenced for Steam Boats, Oct. 13," and continued until January, 1835, when we noticed the following minute:—"River closed on the night of the 3d of January, 1835." Then—"River opened on the 23d.

Navigation then became quite brisk—but, on the 6th of February, inst., it was again stopped by ice. On the 19th inst., the ice broke up again, which brings us to the present time.

Here, then, we have a faithful account of the interruptions of navigation during five years and a half, by which it appears that—

In 1830, the interruption by ice was about 30 days.

1831,	do	do	61 do
1832,	do	do	12 do
1833,	do	do	5 do
1834,	do	do	3 do
			119 do

In 1830, interruption by low water about 130 do

1831,	do	do	44 do
1832,	do	do	169 do
1833,	do	do	64 do
1834,	do	do	76 do
			423 do

Total interruption by ice and low water, 535 days.

It is gratifying to find that the interruption, by ice, during these five years, was less than four months. The obstruction by low water may be remedied.

The following tribute to the talents of Trumbull, as an artist, is just and the more valuable, as coming from an artist. It is an extract from a letter.

I am sorry that Mr. Dunlap should have attacked the old Colonel. Colonel Trumbull's name will endure, and his pictures be valued as memorials of the people of those times. Colonel Trumbull's little pictures at New Haven are gems of art, worth their weight in gold, and had they represented British victories over us, would have filled a conspicuous place in their National Gallery.

[From the New-York Farmer.]

We would ask for the following, which we take from the *Gleaner Farmer*, an attentive perusal. It relates to a subject becoming daily of more importance, and should be better understood. We ask attention also to the able essay read before the Highland and Agricultural Society of Scotland upon the same subject, from the December number of the "Edinburgh Quarterly Journal of Agriculture." We shall, at our convenience, give another from the same work, upon the same subject, which cannot fail to be useful to some of our readers.

**LIVE FENCES.**—From an article on this subject in the January number of the *Cultivator*, we select the following:

The subject of live fences is one of increasing importance to the agriculture of our country. We have many champaign districts of choice land, particularly in the west, and independent of prairie tracts, where there is not likely long to be a reservation of much timber ground, and where there is few or no stone to construct fences. In those districts fencing materials will soon become extravagantly high, and the inhabitants seem to be threatened with the alternative of either dispensing with enclosures, as in France, or of resorting to live fences, as in England. The latter is decidedly preferable, not only to open fields, but to dead fences, unless in districts where fencing materials are abundant and cheap.

Caleb Kirk, of the state of Delaware, a man of the highest reputation for veracity and practical knowledge in husbandry, published some years ago, in the *American Farmer*, several numbers on hedging, in which he gives the result of nearly twenty years' successful experience. In 1819 he states the actual cost of 1,000 feet of an efficient hedge fence, as follows:

1,000 plants, planting and care first year, -	\$3 50
Dressing and care of plants 5 years following, -	5 00
Expense 7th year for stakes, splashing, &c. -	11 25
Expense 6 following years, -	4 50

Total expense for 13 years, - \$20 25

The posts and rails for 1,000 feet of fence are stated at - 75 00

Showing a gain in favor of the live fence of \$40 75 in the 13 years, besides the advantage of the live fence being permanent—as good as new—while the dead fence would have gone to decay, and required a new expenditure to rebuild it. In 1832, when Mr. Kirk's judgment had been corrected by four years' further experience, he says, "I find that fifty cents a rod will complete the raising to a mature age, and one cent a rod will fully maintain forever after, if duly attended to, and applied with judgment. No failure has ever appeared, except some local cause is present; therefore durability is now well established."

If by "hedge thorn" is meant the English hawthorn, (*Crataegus oxyacantha*), our decided opinion is, that it will not answer in Ohio, as it does not do well here in a latitude nearly parallel. We have given it a fair trial, and after patiently nursing it seven years, abandoned the hope of success, and dug up a hedge row of nearly a half a mile of it, and substituted other plants. Neither our summers nor our winters seem suited to its growth and preservation. The yellow locust is wholly unfit for hedges, from the fact that it produces innumerable sprouts from its roots, which would disfigure the

hedge, and seriously encroach upon the fields. Yet we do not know of a tree which it would be more valuable to plant upon the western prairies for wood and timber, than the yellow locust. The growth is rapid, it propagates itself, and it affords a valuable material for fence posts, mill works, and ship building. It will attain a maturity fit for these purposes in twenty-five years from the seed. But the thorns of our country afford excellent materials for live fences, particularly in the districts where they are found growing naturally. This we state as well from personal experience and observation, as from the information of others. In the middle states we have seen good hedges of the Virginia and Newcastle, or cockspear thorns, and we have a promising hedge composed of several indigenous kinds, gathered from the woods and pastures. But the great difficulty is in managing our hedges well. Our own people have as yet but little practical knowledge on the subject, and too many of the foreign laborers, who profess a knowledge on this subject, are mere quacks at the business of managing them. Besides, our climate differs from that of Great Britain, and demands a different culture from that which succeeds there. We have more cold, more heat, more drought. The ditch and bank will not do here, nor is it desirable that it should, as it causes a waste of ground, is unsightly, and is too often a nursery for noxious weeds. A bank and ditch require a width of eight or ten feet, while a simple hedge does not occupy more than two or three feet.

It is believed all the species of native thorn will answer for hedges, as well as many others of our native shrubs and trees. The Bostonians speak well of the buckthorn, though we have never seen it assume any thing more than an ornamental appearance—nothing like a barrier to cattle. We have planted the honey locust, (*Gleditsia trinanthos*), as a material to experiment upon; and so far our confidence of success remains unimpaired; though we are not yet prepared to speak with confidence of the result. The best evidence of our confidence in it is furnished by the fact that we have now a mile or two of hedge row of the plants growing, planted in four or five successive years. The principal fear is that it may grow too large, an objection which will not apply so forcibly in Ohio, where land is abundant, and where the level nature of the country renders shelter desirable in winter. Yet we think, from our manner of training, the nearness of the plants, and by careful attention to clipping, when the growth of the hedge requires it, we can keep it within reasonable bounds. The honey locust, when cut in, does not throw out numerous shoots, like the thorn, but the principal growth is confined to a single stem. Our remedy for this defect is, to bend down and lay in the plant at a uniform height, when the stocks are from one to two inches in thickness, and to repeat laying the new growth every second or third year till the horizontal barrier is four to five feet high. The tops are waited to the right and left alternately of the adjoining plants; and if the top is not depressed below a horizontal position, it continues to live and grow, and sends up shoots from nearly its whole length. The hedge of course becomes firmer and stronger every year.

We will close our remarks by advising Mr. Lookwood and his neighbors to collect, without delay, haws or seeds of the indigenous thorns of their neighborhood, and seeds of the honey locust, which we believe is a native of their forest, and to sow them in the spring in beds of good earth. The

first will not come up till the second year, and many seeds of the latter will not germinate in a shorter time. Keep the seed beds free from weeds, and after two years' growth, the plants will be fit to put in a hedge row. They may also collect in the spring from the woods plants of the thorn, of any moderate size, say from the eighth of an inch to two inches thick, saw off the tops near the roots, and having prepared the ground well, make a trench on the site of a desired fence, and plant the roots one foot apart.

[From the Prize Essays and Transactions of the Highland and Agricultural Society of Scotland.]

**ESSAY ON RAISING AND MANAGING HEDGES.**—In 1833, the Society, considering the subject of Live Fences as one of much importance, offered a premium for an approved Essay, founded on experience, on the manner of raising and managing hedges, and on the kinds of live fence suited to differences of soil, climate, and situation.

The several candidates were required to detail the manner of forming the mound, ditch, and other parts of the fence; the proper period of planting, the price of the plants, the prime cost of wood for rails, and the expense of sawing and putting up the rails; together with the subsequent management. They were also required to state the different kinds of plants adapted to live fences, and suited to differences of situation, soil, and climate; to explain the advantages and disadvantages of a mixture of plants; and to offer suggestions regarding the means of improving the state of the fences of the country. Three Essays were received, to the authors of which premiums were awarded, and of which a condensed account is here presented. It is unnecessary to offer any remarks on the respective merits of these essays, and the different modes recommended, as each of them is given in a tolerably detailed form.

**Essay: By Mr. MONROEMERY, Buchanan House, near Drymen.**—Various plans are in use for raising hedges. The first is, to plant the hedge on an even surface; the second, to place it on a raised surface; the third, to form a ditch, and to plant the hedge at the surface to the side of the ditch; the fourth, to form a mound, and plant the hedge in the middle of it; the fifth, to plant a hedge on each side of the mound, thus forming a double fence; the sixth, to build a sunk wall, or to form a sloping cut, and to plant the hedge at the top of the wall or cut.

Fig. 1.

The first method, that of planting a hedge on an even surface, is represented by Fig. 1. The line being marked out, the ground should be trenched, one yard and a half wide, and eighteen inches deep; and, when of bad quality, it should be improved, by adding good earth. This part of the work may be done at any time of the year. When you are going to plant your hedge, make a level downward cut with the spade the length of the line, along the middle of the trenched ground, and lay it upon one side. When this is done, drop your plants

along the line, in the order in which they are to be planted, and plant them neatly to the side of the cut, placing them three or four inches apart, according to their size. When they are fixed along the line, let the mould be properly trodden to their roots; then dress the ground to the hedge. This sort of hedge requires a strong railing to be kept up, until it become effective as a fence.

Fig. 2.

The second method, although similar to the first, is yet, in my opinion, preferable, on account of the surface being raised a foot high in the middle, as shown by Fig. 2. You prepare your ground as in the first plan, but observe to throw as much mould from the sides as will raise it to the height in the middle. Then plant the hedge as above. A four feet hedge will be as good a fence on the raised surface, as one of five feet on even ground, and the expense is

The third plan is the usual method of making a ditch along the line, three feet inside at the surface, nine inches at the bottom, and two feet and a half deep, all the earth being thrown on the side of the ditch on which the hedge is to be planted, it being usually placed near the surface of

good earth, and the hedge planted close to the top of the wall. This, in my opinion, is the most efficient fence, and in the end the cheapest. The hedge should not be allowed to grow higher than two feet and a half. When stones are not easily got, you have only to use turf a foot or nine inches high, if the ground is good, and this turf you can get from the surface you move in making the sloping cut. Where the ground is good, raise the wall or building with turf nine inches above the original surface; when poor, raise it a foot, and fill it well up at the back with the best of the earth for the hedge, which is to be planted a foot back from the front. The cut requires to be only two feet deep if the ground is good, and one foot nine inches deep when it is poor.

The next thing to be considered is the expense of executing the work in the different ways. According to the first two plans, where the ground can be worked with the spade, the expense is nearly equal, as the additional work in raising the surface in the second plan is balanced by the expense of staking being less than in the first, a tab or stake four feet long on the raised surface being equal to one of five feet on the even surface.

Trenching the ground a yard and a half wide, one foot six inches deep, can be done per lineal yard at

Taking out the spading along the middle, and planting the hedge..... 0 0 1  
Expense of plants, nine or ten to the yard... 0 0 24  
Expense of railing, five-foot stakes, two to the yard, rafter and nails..... 0 0 24

Amount per lineal yard..... 20 0 74

In the second plan, the railing requires a stake of only four feet, and, in my opinion, a hedge on the raised surface will become a fence two years sooner than one on the even surface. There is also one-fourth less expense in the annual dressings. The cause of this is obvious, as a hedge on the raised surface is as good a fence three feet high, as a hedge of four feet on the even surface.

Expense of trenching and raising the ground per lineal yard..... 20 0 2  
For plants and planting the hedge..... 0 0 24  
For four-foot stakes, two to the yard, rafter, nails, and putting up..... 0 0 24

Amount per lineal yard..... 20 0 74

In the third plan, or the common way of a ditch and a hedge on the side, the usual way is, when the ditch is cut on each side,

to take a good turf, and lay it with its grass side downwards, on the side of the ditch where the hedge is to be planted. Lay the turf to fit the slope of the ditch, the slope to be six inches in the foot. Then plant your hedge, nine or ten plants to the yard, with the tops of the plants even with the slope of the ditch, on the top of the turf, putting the good surface-mould to the roots of the plants, and throwing the rest of the earth that is taken out in forming the ditch to the back of the hedge. This method of planting the hedge I do not approve, for the following reasons. The first year the hedge looks likely to succeed, but the second year the frost during the winter loosens the earth about the roots, when much of it falls down into the ditch, and the roots of the hedge become exposed, and are injured by the dry weather in summer, so that the hedge makes little progress, and becomes stunted in its growth.

Expense of forming the ditch, as shown by Fig. 3, per lineal yard..... 20 0 2  
Expense of plants, and planting the hedge, 9 or 10 to the yard..... 0 0 24  
Three-foot stakes, rafter, nails and putting up, 0 0 2

Amount per lineal yard..... 20 0 74

According to the fourth plan, you begin with a surface three feet and a half wide, building up the sides with turf a foot high on each side, and sloping six inches in the foot, which will make the top of the mound two feet six inches wide; and on each side make the sloping cut two feet high, which makes the mound five feet six inches wide at bottom. The good earth moved in making the sloping cut is to be thrown into the mound, in sufficient quantity to allow for subsiding.

Expense of forming the mound per lineal yd. 20 0 24  
Do. of plants and planting along the middle of the mound..... 0 0 24  
Do. of stakes of two feet six inches, rafter, nails, and putting up..... 0 0 12

Amount per lineal yard..... 20 0 74

The fifth plan being somewhat similar to the fourth, only having a double hedge, will require three feet six inches of width at the top, four feet six inches at the surface, and six inches at the bottom. The sloping cut on each side is shown by fig. 5.

Adding 3d. per lineal yard to the expense by the fourth plan, that of the present will amount, per lineal yard, to..... 20 0 94

I would here observe, that the single hedge planted in the middle is the most ad-

visible, and in my opinion the best fence. I would by no means recommend the mound-fence in dry ground, as in that case the mound will get into a state of aridity, and the plants will not grow. Furze may answer in such a case, but nothing else. I certainly give the preference to the mound with the hedge in the middle, it being the least expensive, the least troublesome in its management, and the more certain of the two to become a good fence.

The plan shown by fig. 6 is the sort of fence which I would particularly recommend as the most substantial and efficient for inclosing ground for planting, and in every respect the most effectual in the shortest time, and attended with the least expense in the management after being planted.

The expense of the first method shown by fig. 6, or when built with stone in front, is as follows:

For building and sloping the ground, per lineal yard.....	£0 0 6
Expense of plants and planting the hedge.....	0 0 3
Railing stakes two feet, rafters, nails, and putting up.....	0 0 11

Amount with stone facing, by the sixth plan, £0 0 11

When the side, is built of turf, the expense is as follows:

For building the side, and sloping the ground, per lineal yard.....	£0 0 2
Expense of plants and planting.....	0 0 3
Railing 2-foot stakes, rafters, and putting up,.....	0 0 14
	£0 0 6

The last plan with turf, as shown by fig. 6, is the cheapest in putting up, but that with the wall in front is the best. The great advantage is the planting of the hedge a foot back from the front, at the top of the building with stone or with turf. This allows the hedge to have a plentiful supply of moisture at the root, without being injured by the changes of the season. The railing is less expensive, as the hedge will become a fence in half the time required for the first and second methods, and the hedge in either of the last two plans being a good fence when two feet high, whereas, by the first two plans, it will require to be four feet high.

The mound-fence, with the hedge in the middle, would, in favorable situations, be a good fence in the same period as by the last methods; but there are few situations that suit this mode of fencing, for the reasons already stated.

I have now to speak of the different sorts of plants used in making fences. The following are the kinds respecting which the society demands information, with their prices per thousand.

Mawthorn, <i>Crataegus oxyacantha</i> , 20 to 24 inches high.....	8s. to 10s.
Beech, <i>Fagus sylvatica</i> ,.....	15s. to 20s.
Hornbeam, <i>Ostrya vulgaris</i> ,.....	15s. to 20s.
Birch, <i>Betula alba</i> ,.....	15s. to 20s.
Holly, <i>Ilex aquifolium</i> ,.....	50s.
Furze, <i>Ulex europaeus</i> ,.....	15s. to 20s.

To these may be added,

Yew, <i>Taxus baccata</i> ,.....	100s.
Evergreen Privet, <i>Ligustrum vulgare</i> ,.....	15s.
Elder, <i>Sambucus nigra</i> ,.....	30s.

The thorn, hornbeam, holly, and yew, are raised from seed, generally sown in autumn; the beech and whin are sown in spring; the evergreen privet and elder are raised by cuttings four or five inches long, planting them in the ground early in March, in rows of a foot between, and three inches in the row. More sorts might be added, but the above are those most approved of for live fences.

The hazel, birch, and whin, I do not

hold in much estimation, whether used singly, or mixed with others. The two first do not repel cattle, and sheep destroy the whin in winter, nor would it mix with other plants to advantage. The birch is too pliant when young, the hazel grows too open and large in the leaf to mix, and in my opinion none of these should be used in live fences.

The thorn, the holly, and the yew, are well known, and require nothing to be said in their recommendation. The beech, hornbeam, elder, and evergreen privet, are particularly suitable for mixing in live fences, and are also long-lived plants.

Those which I would most recommend for being generally useful as fences, are the thorn and evergreen privet, the elder and evergreen privet. When the hedge is of the first two, let the proportion be two plants of thorn to one of privet; when of elder and evergreen privet, let the number be equal; when of thorn and beech, let there be two of the thorn to one of the beech; and when of thorn and hornbeam, let them be alternately planted.

The thorn and hornbeam, the thorn and beech, the elder and hornbeam, and the elder and beech, make good hedges, and have a reddish appearance during winter. The evergreen privet, mixed with thorn or elder, makes a very good hedge, and has a beautiful olive green appearance during the winter, when dressed in proper time in summer. Therefore I consider it the best plant to mix with the thorn, or with the elder, as the cattle do not eat it so readily, nor have I seen it infested with any sort of insect. The leaves being small, are not injurious to the hedge; the roots are also very numerous, and soon fix the mould at the surface, so as to prevent it from falling away from the hedge, or tumbling down into the ditch.

Hedges should be cut or dressed in the middle of summer, and the usual way of dressing them only in winter is very objectionable, the growth of the hedge being, as it were, lost; from being allowed to grow at the top all the season, it becomes there luxuriant, while at the bottom very little progress is made, and in a few years it becomes quite naked below. By cutting the hedge in summer, an equal growth is produced all over, from the bottom to the top; and by the second growth its closeness is increased, and the hedge greatly improved. The dressing should take place from the 20th of June to the middle of July, according to the advanced growth of the hedge. By attending to this plan of dressing your hedges twice in the year, you would do them in much less time than would be the case were you to allow them to grow on all the season without cutting.

The season for planting hedges is often too little attended to, such work being left until spring; but the proper time is when the leaf begins to drop from the young thorns. I recommend planting hedges in November and December, and not later than February; for then the juices begin to circulate, and cutting the roots after that period allows the sap to escape, and thus retards the growth of the plant the first season. The hedge ought to be planted, as recommended, with well selected plants, from twenty to twenty-four inches high, and two years transplanted. They are to be cut down to twelve inches, and if properly planted will make fine strong shoots the first year, which should not be cut until winter, when the hedge is to be dressed in the wedge form to 18 inches high. After the first year dress your hedges in sum-

mer, and in the end of the season, increasing them gradually to the height required.

When the hedges are well managed, those at the top of the sunk wall, or building of turf, as shown by fig. 6, will be a good fence the third year; on the raised surface in four years; and on the even surface in six.

On the subject of weeding the hedges and cleaning the ditches, a great deal might be said, were I to follow the ordinary practice; but the method which I recommend is simple, and requires few words. When your hedge is planted, sow on each side of it white clover seed, to the breadth of from two to three feet, as early as you can in spring; and once or twice during summer cut the grass with a short scythe, or a grass hedge-hook. If thistles, docks, or other strong weeds, rise, remove them; but never dig about your hedges, unless you are going to add plants. Let the grass be kept down two or three feet out from the hedges, and dress them as directed.

Ditches require very little cleaning, if made according to the plan recommended above, one in two years being enough, and the expense trifling. When the side your hedge is on is well sloped, there is little falling down, and on the opposite side, sloped away from the bottom of the ditch, there is very little filling up, so that, in most situations, the business may be done for less than a halfpenny per yard.

When you put up your railing to serve as a fence and as a protection for the young hedge, particularly in the case of that planted on the even or raised surface, in the division of fields, with cattle occasionally grazing on each side, I would recommend to put the stakes alternately on each side, one foot six inches out from the hedge, driving them sloping, so as to project six inches over the hedge, they being four feet or four feet and a half long.

For the other fences, stakes two feet or two feet and a half long, are sufficient. Drive them into the ground at the distance of one foot from the hedge; and in putting up the railing, drive the stakes on one side first, nailing the rafters two inches from the end of the stakes, making the rafter to be exactly over the top of the hedge. When this side is finished, drive the stakes on the opposite side, making them to rest on the rafter, and project two inches over it.

When hedges require to be protected on one side only, make your railing accordingly. For the sunk wall or hedge, and building with turf and hedge, use stakes two feet long; drive them into the ground six inches, and four or five feet apart, sloping so that the top-rafter will be even with the outside of the wall or turf, and let another rafter be half-way between the top-rafter and the turf or wall. Such protection for the fence will be found a sufficient fence for repelling sheep or black cattle, on either of the last-mentioned plans, until the hedge is an efficient defence of itself, it being observed to bring the hedges in the cutting, as soon as it can be done, even with the front of the turf building or wall.

ON DRAUGHT, No. 1.—It may be recollected that, while treating upon the qualities and history of the Horse, I alluded not unfrequently to the subject of draught, as being an interesting topic of investigation. More recently I have had occasion to examine the subject with some care, with especial reference to canals and canal transportation. To a superficial observer, the subject promises nothing of interest; and even to more

reflecting minds it is often passed by, as a matter familiar to all, and requiring no special consideration. The application of animal power in the conveyance of property, is indeed an every day occurrence, and we are all constantly in the habit of applying principles and using expedients, for which we can give no more satisfactory reason, than that they answer our present purpose. The slightest reflection, however, will readily convince us, that the use and application of power, in every possible shape, must involve many important principles.

I do not propose, at present, to discuss this topic in all its varied applications, nor to investigate or explain the numerous philosophical principles with which it is connected; but merely to offer some plain reflections upon the result of my inquiries; and if they shall afford any gratification to the readers of the Farmer, they are heartily at their service.

*Draught*, in the sense I shall here use it, is the moving of any substance, by *dragging*. The subject is usually divided into three parts: first, the power to be applied; second, the substance or vehicle to be moved; and third, the channel of conveyance.

The first of these divisions embraces a wide field of investigation, inasmuch as the application is co-extensive with the works of nature.

Power, in the abstract, is a mysterious and inexplicable principle, and far beyond the reach of our comprehension. Its application, however, in all the varied operations of nature and art, and the laws which govern this application, have been subjects of philosophical investigation from time immemorial. This must ever be the extent of scientific research; for the moment we pass these boundaries, we are lost in the contemplation of Omnipotence.

Aside from Deity, the great author of all power and motion, we know nothing of their origin or cause; and it is curious to notice, how strangely philosophers and sages have argued and reasoned on this subject, until within a few years; simply by mistaking the effect for the cause. If we reflect a moment upon the cause of our own locomotion, we shall at once perceive, that what is usually called *animal power*, and concerning which so much has been written, as a *first cause* of motion, is, after all, something we cannot fathom. When a person, from a state of perfect inaction, sets his body in motion, he exerts great *animal power*; but this is only its effect, and not the cause. Suppose a man throws a cannon ball to any given distance; he exerts great *power*, and the man is considered as the moving principle, the *cause* of the motion of the ball. But from whence does he derive this power? There is nothing in bone and muscle to propel a ball any more than in a stick or stone; all are wholly inert, until some moving principle is applied. A mass of flesh exerts no power; nor does spirit apply at all to material matter. Whence, then, comes this moving principle? It is not inherent in flesh and blood; nor is it the consequence of spiritual agency: for beasts, who have no spirit, exert the same power. What, then, is *animal power*? Here we are lost in the infinitude of Omnipotence, and are left to admire and adore that wisdom and goodness which has invested us with such mysterious and wonderful qualities. All we are permitted to do, is to apply this principle in all the various circumstances of our existence, and to investigate its effects, when thus applied.

My present object, however, is only with the application of this principle to *draught*;

and as there are only two kinds of power, animal and mechanical, which are as yet applied to the common purposes of draught, I shall consider only these two in their various applications.

By *animal power*, as I have before intimated, is simply meant the moving of any given substance by the exertion of animal strength, such as the drawing of a cart by a horse, or an ox. *Mechanical power* is the same principle applied by means of machinery, and usually is the effect of steam.

As much competition has arisen of late between these two agents, by the introduction of railroads, it might be an interesting inquiry to compare their respective merits, with all their attendant advantages and disadvantages; but I have neither time nor inclination for so great a task. Still, it may be well to state a few circumstances connected with their respective operations. And before doing this, I will explain what is meant by "force of traction," a term which is constantly used in speaking on this subject; and for this purpose, I will avail myself of an extract from a foreign work.

"A force is most conveniently measured by the weight which it would be capable of raising; but it is not therefore necessarily applied vertically, in which direction weight or gravity acts.

"If a weight of 100 lbs. be suspended to a rope, it is clearly exerting upon this rope a force of 100 lbs.; but if the rope be passed over a pulley void of friction, and continued horizontally, or in any other direction, and then attached to some fixed point, the weight still acts upon all parts of this rope, and consequently upon the point to which it is fixed, with a force equal to 100 lbs.; and so inversely, if a horse be pulling at a rope with a force which, if the rope were passed over a pulley, would raise 100 lbs., the force of traction of the horse is in this case 100 lbs." Spring steel-yards being now commonly in use, we may be permitted to refer to them as affording another exemplification of our meaning. In pulling at a steel-yard of this description, whether the force be exerted horizontally or vertically, the index will, of course, show the same amount—and, consequently, if the strength of the horse be measured by attaching the traces to one of these steel-yards, the number of pounds indicated on the dial will be the exact measure of the strain the horse exerts, and the amount of strain is called the "force of traction."

In other words: a man may be able to draw or push upon a railway a carriage weighing 2,000 lbs., while at the same time he cannot lift more than 100 lbs. It will readily be seen, that the latter is the measure of his strength, or force of traction, while the former is simply the effect of it.

The force of traction of a horse has been variously estimated by different authors from 80 lbs. to 200 lbs.; but the ordinary average at a slow pace is now rated at 125 lbs., over and above the power necessary to carry his own body.

The comparative merits of horse and steam power, when applied to the conveyance of property, must depend principally upon their practicability and expense. These two points are most conveniently tested upon railways; where both powers are constantly in use, and of course their practicability proved.

The annual expense of a horse depends upon the interest of purchase money, the decrease of value, the hazard of loss, the value of food, harness, shoeing, and farriery, rent of stabling, and expense of attendance. These are estimated in England, by Mr. Tredgold, in his work on Railroads, at about

£60 sterling, or \$266.40, allowing the horse a power of 125 lbs., travelling at the rate of three miles per hour, and the day's work at eighteen miles.

The annual expense of a steam carriage consists of the interest of first cost, the decrease of value, the hazard of accidents, the value of fuel and water, renewals and repairs, and expense of attendance. These are estimated at £51, or \$226.44. This power is equal to a force of traction of 155 lbs., for the same number of miles per day as the horse, and after deducting the power necessary to move the engine. Thus it appears that the expense of the horse is to that of the steam-engine about as 147 to 100; which shows a decided advantage in favor of steam power when used upon railways. If, then, the power of the horse and steam engine could always be applied to draught upon rails, we should be at no loss to determine the preferable agent; but unfortunately we are compelled to use roads as we find them; and under such circumstances, horse power presents a different aspect.

In the ordinary use of horse power upon common roads, the force of traction of the horse and expense of keeping will remain much the same as above stated, while those of the steam carriage, for the same purpose, must undergo considerable change. The carriage must be heavier and stronger, and of course the cost more; the expense of fuel more, and wear and tear greater, because more power will be required to overcome the varied resistance. Under these circumstances, the proportionate expense of horse and steam power is estimated to be about 115 to 100.

If this estimate is correct, there can be no great advantage arising from the use of steam power, even when the roads are good, and approximate towards the smoothness of rails, unless where velocity is required at the expense of power. Ordinarily, it will be found that the horse will adapt himself so perfectly to his work, increasing or diminishing his power, as occasion or resistance may require, that the *average effect* of his power will be increased, rather than diminished, thereby enhancing his average force of traction. On common roads great obstructions are often presented, and constant changes of ascent and descent occur; and it is on such occasions that horse power is decidedly advantageous.

On the contrary, a steam engine of a given power cannot increase or diminish its force to meet every little variation in the road, and it must consequently come to a dead stand when any resistance occurs beyond its force of traction. "For instance, suppose the carriage to be advancing steadily under the effect of a force of traction of 500 lbs., and that a stone or rut suddenly causes a resistance, which it would require 600 or 800 lbs. to overcome; if the impetus or momentum of the mass be not sufficient to carry it over this obstruction, the machine must stop until some increased power be given to it."

These objections to mechanical power are, however, not insurmountable, but they present such serious difficulties in practice, that some farther discoveries must be made, and some greater inducements offered, before it can come into general use.

Under such circumstances, connected with the numerous other contingencies, which seriously affect the practical application of this power, we shall readily be induced to abide by our old friend, the horse; and make his burthen easy, and his labor as effective as possible. *Quæcus.*—[Genl Farmer.]

NEW-YORK AMERICAN.

FEBRUARY 21—27, 1836.

## LITERARY NOTICES.

**THE LIFE OF THE EMPEROR NAPOLEON**, with an Appendix, containing an examination of Sir Walter Scott's Life of Napoleon Bonaparte, &c. &c. by H. LEE; Vol. 1: New York, CHAS. DE BEHR. —It is a source of just pride to Americans, that the best life of the great Discoverer of this new world is from the pen of an American. There was a special fitness and beauty in the undertaking, and it was executed in a manner that will convey to future times the name of Irving, as inseparable from that of Columbus.

The life of Napoleon, the Emperor, by an American has no such *prima facie* recommendation—that is—there is no such special fitness that an American should record the acts of a European conqueror, whose career was all European, as of a European navigator whose immortality rests upon his discovery of this quarter of the globe. Yet there are considerations belonging to the position, habits of thinking, and mode of estimating men, of a well educated American, which would seem peculiarly to qualify such a man as the biographer of one, who, like Napoleon was as much the idol of his own nation as he was the object of fear and hatred to others. It was therefore we heard with pleasure, that Major Lee had been employing his time and talents while residing in France, on a history of the life of Napoleon. His capacity and skill as a writer—his patient research and his controversial powers—all which, it was obvious, after the numerous biographies of Bonaparte heretofore written, would be needed—had been abundantly proved to his countrymen by his vindication of his father from the aspersions of Mr. Jefferson.

In the volume now before us, the first of four, through which the work is to extend, we have the expectation that our anticipations were not too sanguine. Mr. Lee enters into his subject with zeal and eloquence—and at the same time, with an elaborate minuteness of refutation in respect of the statements of Sir W. Scott, that, although successful, becomes almost tedious. It is however, to be said here, that by the judicious arrangement of throwing all the controversial matter into an appendix (which in a volume of 586 pp. constitutes 300) the main narrative is unbroken, and given in all cases with the coloring and the statement of facts, which after collating conflicting accounts, and examining all the points for himself, the author conceives to be the true ones.—As to his impartiality, and fitness for the task, the preface has these remarks. "The author, removed from the influence of national or personal feeling in relation to his subject, is sensible of as little disposition to respect the follies of French, as the unfairness of British historians, while he records the actions of a man, whose character, in rising to a level with the noblest examples of any former age, provoked and encountered the vilest prejudices and passions of his own." The narrative in this first volume terminates with 1796, up to which period the ulterior designs, or destinies (as it may have been) of Napoleon, were too little developed, to put the impartiality of an American biographer to the test, and therefore we are not to assume that the open and undisguised admiration everywhere expressed in these pages, for the character and motives of this great man, will not yield to regret and indignation, as

in his future career, the contempt which he displayed for human liberty and human life, when weighed against his own ambitious soarings, was so systematically acted on.

The style of this book has the faults which characterize the previous writings of Major Lee—redundancy, florid exuberance, and magniloquence exceedingly disproportioned, sometimes, to the immediate subject. On the other hand, it has occasional bursts of eloquence and passages of sustained excellence, which carry the reader away; and throughout, the narrative is so skillfully conducted, as to fix and retain attention.

We have said before that the controversial part, though sometimes tedious, was successful; and certainly no one can examine the Appendix without being satisfied that Sir Walter Scott, in his life of Bonaparte, was too little cautious in adopting ill-attested rumors, and not by any means dispassionate, in forming his conclusions respecting the motives and character of his hero.

We must not take leave of this volume without saying how admirably it is printed. A large, clear, open type, on white paper—not covering it from top to bottom with close printed lines—but widely spaced, and with abundant, but not excessive margin, makes it the most readable book for the eyes, that among the many we have to look at, it has lately been our good fortune to meet with.

**CHRIST CRUCIFIED**—An Epic Poem in twelve books, by WM. ELLIS WALL, M. A. of Trinity College, Oxford. 1 Vol. Oxford.

This volume, handsomely printed, and of which the purpose is to exhibit in a poem in blank verse "the completion of the great scheme of the divine councils, for effecting the redemption of mankind" is among the books recently imported from London. We have not found a moment since the book was sent to us, to look into it, and can only therefore mention it by its title.

**THE MECHANIC'S MAGAZINE**.—It affords us real pleasure to state, as a like just to this valuable magazine, and creditable to the parties concerned, that at the *Novelty Iron Works* in this city, conducted by T. B. Stillman, thirty-seven subscribers for this Magazine sent in their names a day or two ago in one list, with the money for a years subscription in advance, amounting in all (payment for three whole sets of back numbers included) to \$130 50. This is the patronage the Magazine aims at and has a right to expect; the patronage of Mechanics, to whose interests and advancement in useful and scientific knowledge, it is specially devoted.

**A WINTER IN THE WEST**, by A NEW YORKER, 2 vols.: New York, HARPER & BROTHERS.—It is not exaggeration to say, that these volumes—which have been expected with eagerness—fully realize, in the spirit, variety, and interest of the scenes they describe, the highest anticipations.

The writer who, it is no revelation of a secret to say, is Mr. C. F. Hoffman of this city, and who is known to the readers of this paper as the "hag," in the letters which fill these two volumes, displayed equal powers and taste as a writer. A portion of these letters appeared in this paper, as they were hurriedly written, sometimes on his knee, sometimes on the head of a barrel, or any other substitute for a desk. Many of them, however, are now first given to the public, and all

have been retouched, so as, without impairing their original freshness as first impressions, to correct errors of haste, and supply those of omission. There are added, too, in the form of notes, many facts and details of value concerning the population, resources, prices of land and living, in the far western region which Mr. H. visited, and which, though part of our own territory, is in truth less known to us than foreign lands.

The circumstance, too, that this was a winter visit, adds to other attractions, that of novelty; for before, what we knew of that region, was dressed out to our imagination in summer flowers, and verdant prairies.

As a whole we may, without fear of disappointing readers, recommend these volumes to them, as combining useful information concerning a fast advancing portion of our common country, with the attraction of varied personal adventures, of many touching reminiscences and incidents of fading Indian races, and of numerous, and some startling, historical anecdotes of our own bold frontiersmen: the whole related in flowing, spirited, and graceful style.

One of these Indian reminiscences is embodied in the following striking extract:

The tribe of "The Bald Eagle" had been long at peace with the whites. The aged sagamores had acquired their language, and become familiar with their manners. He was a frequent visitor at the fort erected at the mouth of the Kanawha; and the soldiers' children would sit upon the blanket of the kind old Indian, while he fed the arrows of reed to their mimic bows for them, and beguiled the sunny hours with some ancient legend of his people; traditions of their fabulous battles with the all-devouring Gitchie-pahoke, that would make young eyes dilate with wonder; and fearful tales of murdered chieftains who, when the baishkwa (night hawk) flitted through the wood, and the bright foot-prints gleamed along The Path of Ghosts, would stalk round the lodges of their kindred, and whisper the story of their fate to the tardy avengers of blood within. Often, at moon tide, or when the ruddy bank of sunset were softened on the bosom of the broad Ohio, his bark canoe would be seen skimming the river, towards the fort, while the archers ran down to meet the hairless old man, and supplied him with sweetmeats and tobacco, in return for the trifling presents he would bring them from his forest home—baskets of the flexible and delicate-headed birch, pouches of the variegated and patterned porcupine quills, and blots woven by the daughters of the tribe, from the shining feathers of the mourning doves. Twilight would come, and the whippoorwill commenced his evening call from the hillside, while the garrulous ancient still lingered, with his gayish playmates; but night again would find his frail shallop drifting down the stream, while, ever and anon, the chief would pause as he plied his paddle to return the salute of some friendly pioneer who, in the existing peace upon the border, had ventured to place his cabin on the shore.

Many months had passed away, and still with each returning week the children watched for their swarthy visitor; and never failed at least to see his paddle flashing behind some green promontory, and soon impelling his light canoe up on the beach beside them. But at length the chieftain came no more; the little gifts which they had prepared lost their novelty, and they longed in vain for the old Delaware to string their bows anew, or to bring them wild game from the islands, and the rich fruit of the nut-paw from over the river; and still The Bald Eagle came not. The white hunters could tell nothing of him, and the few settlers along the

\* The fossil manmouth is thus named by the Indians.

† This is the name of the Milky Way among our northern tribes.

‡ The high-bird or golden-winged woodpecker.

stream declared they had last seen him floating safely past their cabins, with pipe in mouth as usual, and wending his way to the village of his tribe far down the river; but the neighboring Indians no longer brought them venison and wild-honey from the wood, their otter-traps had been withdrawn from the cane-brake, and the light of their torches was no more seen upon the river, guiding them in the favorite sport of spearing the fish that teem in its waters.

The garrison was not dismayed at the ominous silence: yet the sudden cessation of all intercourse between themselves and the Indians threw a gloom over the little community. There was one among their number, who could have unravelled the mystery; it was one who, like the murderer of Logan's family, had forged at least one link in the monstrous chain of injury which was at this moment knitting the neighboring tribes in bitter hostility to the whites,—it was the assassin of The Bald Eagle. This man, as it afterward appeared, had suffered from the Indians in former years, and in compliance with a vow of vengeance against the whole race, he had waylaid the friendly Delaware on his lonely voyage down the river, and murdered him within a short distance of the fort. The superannuated warrior could make but feeble resistance against the athletic and implacable backwoodsman. The fated savage pleaded vainly for a moment, in which to sing his death-song, but the heart, of the Indian-hater was sealed against the appeal, and the atrocious violence was consummated with equal secrecy and despatch.

But the blood of the victim was yet to cry from the ground.

The revengeful pioneer had accomplished his first purpose of taking the life of an Indian: he was not contented, however, until he had added insult to injury; and with ingenious cruelty ensured that full knowledge of the outrage should reach the friends of the unhappy subject of it; and thus he proceeded to the accomplishment of his iniquitous purpose—he first scalped the hoary crown of the old Delaware, and next fixing the body in the usual sitting posture in the stern of the canoe, he carefully replaced the pipe in his mouth, and adjusted the steering-paddle to the hand of the corpse, which soon stiffened around it. A direction was then given to the boat that bore this ghastly burden, and the stream quickly swept it far beyond his view. The abruptness of the river's bank, and the rapidity of the current near the shore, prevented the doomed bark from stopping in its career, and hurried it on the voyage for which it was so fearfully freighted. The settlers on the river's side recognised the well-known canoe and accustomed form of him that steered it, and dreaming not of the fate that had overtaken its master, they saluted him, as usual, from the shore; but when they hailed, no friendly whoop replied to the call; they beckoned, but the grim boatman heeded not; the shallop still went on, for the hand that guided kept it steadily on its way. The wild deer, drinking from the wave, started at the shadow, as it glided before him; the raven snuffed the tainted form, and hovered above its gory head, yet dared not to alight beside that motionless and stern voyager. And still that bark kept on. But now it has neared the home of the murdered sagamore; and, like a steed that knows the dwelling of its master, it seems to be making unerringly for that green headland where the friends of the loved sachem are waiting the wonted hour of his return.

What more is there to add?—the dumb messenger fulfilled his mission. The neighboring bands at once dug up the tomahawk, and runners were instantly despatched to the remoter tribes: the bloody war-belt passed like lightning along the border: the peaceful Mingoes had wrongs of their own to avenge, and needed not to read its mystic wampum; but the red-handled hatchet was shaken alike among the deep forests of Ohio, and the sunny prairies of Illinois, and the dark glens of Kentucky; while by the thousand lakes of Iowa, the warlike bands that haunt those crystal waters clutched with eager hands the fearful emblems.

The allotted days of fasting had passed by for the friends of the murdered Delaware; the black

hue of mourning was washed from their indignant brows; and ere the crimson die of battle had dried upon their cheeks, the banks of the Ohio resounded with the war-whoop; while the burning of their cabins, and the massacre of their neighbors, gave the terrified settlers the first intimation of the foul murder of the Kenhawa.

The horrors of the war of retaliation thus commenced, continued to rage until Lord Dunmore's expedition put a period to the strife; and the dwellers on the shore that was coasted by the dead boatman would long after shudder when they remembered *The last errand of the Bald Eagle*.

We will not take leave of these volumes without stating that the writer of them, Mr. Hoffman, has become the proprietor of the *American Monthly Magazine*—a periodical which has already attained deserved celebrity in our city, by the taste and talent with which it has been conducted, and which, retaining the services and abilities heretofore enlisted in its support, will receive the accession of those of the author of *A Winter in the West*.

We hope, as we believe confidently, in Mr. H's full success in this career.

A SERMON ON WAR, delivered January 25, 1835. By WM. E. CHAMBERLAIN. Boston: Homer & Palmer.—Again we are about to quote a Sermon,—an eloquent and well-timed Sermon,—on the evils, the wickedness, and the desolation of wanton and unnecessary War.

The reputation of the preacher,—the topic it treats of, new, alas! not of distant and speculative interest to us, but one that is near, imminent, and coming home to the business and bosoms of us all,—together with the eloquent and just views expressed, render this discourse valuable, as it is well-timed.

The subject is thus introduced:

I ask your attention to the subject of public war. I am aware, that to some this topic may seem to have political bearings, which render it unfit for the pulpit; but to me it is eminently a moral and religious subject. In approaching it, political parties and interest vanish from my mind. They are forgotten amidst the numerous miseries and crimes of war. To bring war to an end, was one of the purposes of Christ, and his ministers are bound to concur with him in the work. The great difficulty on the present occasion is, to select some point of view from the vast field which opens before us. After some general remarks, I shall confine myself to a single topic, which at present demands peculiar attention.

Public war is not an evil, which stands alone or has nothing in common with other evils. It belongs, as the text intimates, to a great family. It may be said, that society, through its whole extent, is deformed by war. Even in families we see jarring interests and passions, invasions of rights, resistance of authority, violence, force; and in common life, how continually do we see men struggling with one another for property or distinction, injuring one another in word or deed, exasperated against one another by jealousies, neglects and mutual reproach. All this is essentially war, but war restrained, hemmed in, disarmed by the opinions and institutions of society. To limit its ravages, to guard reputation, property and life, society has instituted government, erected the tribunal of justice, clothed the legislator with the power of enacting equal laws, put the sword into the hand of the magistrate, and pledged its whole force to his support. Human wisdom has been manifested in nothing more conspicuously, than in civil institutions for repressing war, retaliation, and passionate resort to force among the citizens of the same State. But here it has stopped. Government, which is ever at work to restrain the citizen at home, often lets him loose and arms him with fire and sword against other communities, sends out hosts for desolation and slaughter, and concentrates the whole energies of a people in the work of spreading misery and death. Government, the

peace officer at home, breathes war abroad, organizes it into a science, reduces it to a system, makes it a trade, and applauds it as if it were the most honorable work of nations. Strange that the wisdom, which has so successfully put down the wars of individuals, has never been inspired and emboldened to engage in bringing to an end the more gigantic crimes and miseries of public war. But this universal pacification, until of late, has hardly been thought of, and in reading history, we are almost tempted to believe, that the chief end of government, in promoting internal quiet, has been to accumulate greater resources for foreign hostilities. Blood-shed is the staple of history, and men have been butchered, and countries ravaged, as if the human frame had been constructed with such exquisite skill only to be mangled, and the earth covered with fertility only to attract the spoiler.

Passing, then, in review the pretenses under which wars are generally undertaken, and arriving at that called "sensitivity to national honor," the preacher thus examines what constitutes this honor.

The first element of a nation's honor is undoubtedly Justice. A people, to deserve respect, must lay down the maxim, as the foundation of its intercourse with other communities, that justice, a strict regard to the rights of other States, shall take rank of its interests. A nation, without reverence for right, can never plead in defence of war, that this is needed to maintain its honor; for it has no honor to maintain. It bears a brand of infamy, which oceans of human blood cannot wash away. With these views, we cannot be too much shocked by the language of a chief magistrate recently addressed to a legislative body in this country. "No community of men" (he says) in "any age or nation, under any dispensation, political or religious, has been governed by justice in its negotiations or conflicts with other States. It is not justice and magnanimity, but interest and ambition dignified under the name of State policy, that has governed and ever will govern masses of men acting as political communities. Individuals may be actuated by a sense of justice; but what citizen in any country would venture to contend for justice to a foreign and rival community in opposition to the prevailing policy of his State, without forfeiting the character of a patriot." Now if this be true of our country, and to our country it was applied, then I say we have no honor to fight for. A people, systematically sacrificing justice to its interests, is essentially a band of robbers, and receives but the just punishment of its profligacy in the assaults of other nations. But it is not true that nations are so dead to moral principles. The voice of justice is not always drowned by the importunities of interest; nor ought we, as citizens, to acquiesce in an injurious act, on the part of our rulers, towards other States, as if it were a matter of course, a necessary working of human selfishness. It ought to be reprobated as indignantly as the wrongs of private men. A people strictly just has an honor independent of opinion, and to which opinion must pay homage. Its glory is purer and more enduring than that of a thousand victories. Let not him, who prefers for his country the renown of military spirit and success to that of justice, talk of his zeal for its honor. He does not know the meaning of the word. He belongs to a barbarous age, and desires for his country no higher praise than has been gained by many a savage horde.

The next great element of a nation's honor is a spirit of Philanthropy. A people ought to regard itself as a member of the human family, and as bound to bear part in the work of human improvement and happiness. The obligation of benevolence, belonging to men as individuals, belongs to them in their associated capacities. We have indeed no right to form an association of whatever kind, which covers us from the human race. I care not, though men of loose principles scoff at the idea of a nation respecting the claims of humanity. Duty is eternal, and too high for human mockery; and this duty in particular, so far from being a dream, has been reduced to practice. Our own country, in framing its constitution, proposed to insert an article prohibiting any

feeling; and this it did in the spirit of humanity, to diminish the crimes and miseries of war.—England from philanthropy abolished the slave trade and slavery. No nation stands alone; and each is bound to consecrate its influence to the promotion of equitable, pacific and beneficent relations among all countries, and to the diffusion of more liberal principles of intercourse and national law. This country is entrusted by God with a mission for humanity. Its office is to commend to all nations free institutions as the sources of public prosperity and personal dignity, and I trust we desire to earn the thanks and honor of nations by fidelity to our trust. A people, reckless of the interests of the world, and profligately selfish in its policy, incurs far deeper disgrace than by submission to wrongs; and whenever it is precipitated into war by its cupidity, its very victories become monuments of its guilt, and deserve the execration of present and coming times.

I now come to another essential element of a nation's honor, and that is, the existence of institutions which tend and are designed to elevate all classes of its citizens. As it is the improved character of a people which alone gives it an honorable place in the world, its dignity is to be measured chiefly by the extent and efficiency of its provisions and establishments for national improvement, for spreading education far and wide, for purifying morals and refining manners, for enlightening the ignorant and succoring the miserable, for building up intellectual and moral power and breathing the spirit of true religion. The degree of aid given to the individual in every condition for unfolding his best powers, determines the rank of a nation. Mere wealth adds nothing to a people's glory. It is the nation's soul which constitutes its greatness. Nor is it enough for a country to possess a select class of educated, cultivated men; for the nation consists of the many not the few; and where the mass are sunk in ignorance and sensuality, there you see a degraded community, even though an aristocracy of science be lodged in its bosom. It is the moral and intellectual progress of the people, to which the patriot should devote himself as the only dignity and safeguard of the State. How needed this truth! In all ages, nations have imagined, that they were glorifying themselves by triumphing over foreign foes, whilst at home they have been denied every ennobling institution, have been trodden under foot by tyranny, defrauded of the most sacred rights of humanity, enslaved by superstition, buried in ignorance, and cut off from all the means of rising to the dignity of men. They have thought that they were exalting themselves, in fighting for the very despots who ground them in the dust. Such has been the common notion of national honor; nor is it yet effaced. How many among ourselves are unable to stifle their zeal for our honor as a people, who never spent a thought on the institutions and improvements which ennoble a community, and whose character and examples degrade and taint their country, as far as their influence extends.

I have now given you the chief elements of national honor; and a people cherishing these can hardly be compelled to resort to war.

#### SUMMARY.

The anniversary of Washington's birth is celebrated to-day. The Artillery Corps, under Gen. Morton, paraded and fired a salute at 12 o'clock. The French brig of war *d'Assas*, lying off the Battery, is dressed out in her colors, and also fired a feerdal salute of 24 guns, in honor of the occasion.

After the salute from the Brig which was returned by loud Hurrahs from the shore, the Commandant and his officers landed and were received at the pier by the Mayor of the city and General Morton, and escorted amid cheers to the residence of Gen. Morton, where a collation was prepared.

The 23d February falling on Sunday, was celebrated yesterday, in various becoming ways—but in no one more tastefully or with more enthusiasm, than at the ball given by the 3d Regiment,

New York State Artillery, under the command of Col. George P. Morris, at Niblo's. The large saloon was festooned with drapery, so as to resemble a vast tent, under the canopy of which, flaunting banners, and burnished arms, and bright lights, and brighter eyes, were glancing.

A thousand hearts beat happily,—and when  
Music arose with its voluptuous swell,  
Soft eyes looked love, to eyes which spake again,  
And all went merry as a marriage bell.

Among the guests of the occasion we were glad to perceive the officers of the French brig of war *d'Assas*, who, accompanied by the Mayor and General Morton, were received with every mark of kindness and consideration. Altogether, the scene was a very brilliant one, and the dance was kept up with spirit till a late, or rather early, hour.

OLD IRONSIDES.—We are happy, says the Boston Atlas, to hear that the veteran Commodore Rodgers is to take command of the frigate Constitution after her arrival at New York, and will proceed in her to the Mediterranean. On his arrival there he will assume the command of the squadron.

The Philadelphia Gazette states that orders have been received for the immediate completion of the two vessels of war on the stocks at the Navy Yard.

SMALL NOTES CIRCULATION.—The bill, as reported by the committee, and as it has finally passed the senate, prohibits the circulation of these notes after a period of eighteen months—six months for each denomination under \$5.

The proposed amendment of the constitution, restoring the salt and auction duties to the general fund, whenever the entire amount of the canal debt shall be collected and invested, passed the house yesterday by the strong constitutional vote of 94 to 26. Having previously passed the Senate, it now only wants the Governor's signature to become a law.

MELANCHOLY ACCIDENT.—Death of Lieut. W. S. Chandler, of the U. S. Army.—On the 25th ult. Lieutenant Walter S. Chandler, an estimable and intelligent officer in the U. S. Army, left Mobile in a small boat, with a Sergeant and four soldiers, for Fort Morgan, where he was stationed. The boat was capsized on a gale, about two miles below the Choctaw Point light house, and all on board perished, except one soldier who clung to the bottom of the boat, and was taken off the following morning by Capt. Prior, of the steamboat Watchman, from New Orleans. The name of the soldier saved is Clarke. Those in the boat was Sergeant Grant, and soldiers Wise, Finn and Stevens.

Clarke states that Lieut. Chandler, as each man relaxed his hold and was swept off from the boat by the current, swam immediately to his relief, and with encouraging words and actions, endeavored to sustain and save him. As Lieut. Chandler was a tall and athletic young man, and an expert swimmer, it is more than probable that he would have escaped with his life, had not his strength been exhausted by these humane efforts. It is also said by Clarke, that Lieut. Chandler, who was the last to sink, a few moments before he descended in the struggle of death, told Clarke, to exert every nerve to preserve his own life—that he himself could not endure it much longer; but if they must die they would die like men. These were his last words, and soon after they were uttered, his lips were forever sealed. Lieut. Chandler was a native of the district of Columbia, and graduated at West Point in 1830.

We learn, (says the Mobile Register) that Lieut. Chandler was accompanied by a young gentleman, a stranger in the city, whose name we have been unable to ascertain, who was also drowned.—[Charleston Courier.]

SAVANNAH, Feb. 10.—A rate eight.—We were presented yesterday with a lump of ice taken

from a hogsheed in the city, which, was 6 measurement, three and a quarter inches thick.—Our readers may be assured we had no use for it, while the mercury in our Thermometer was playing about the Freezing point. We learn that on Sunday last, the Canal near the River was almost thick enough to admit of Skating.—We fear the indigent have suffered during this severe weather.

SHIPWRECK WITH LOSS OF LIFE.—We regret to record the shipwreck of the splendid and valuable ship Sovereign, Capt. C. Griegwald, on Squam Beach, about 40 miles south of Sandy Hook.—The Sovereign sailed on the 8th of January from Portsmouth, with a full and valuable cargo, and about thirty passengers. She made the back side of Long Island on Monday, and on Tuesday morning about 4 o'clock, struck on Squam Beach, where she now lies—the weather very severe, cold and rainy. Mr. Cook, a respectable inhabitant residing on the spot, left yesterday, (Thursday) morning, and reached here via Amboy last evening. He states that all the crew and passengers, about fifty in number, were not able to land until Wednesday night. One of the cabin passengers, name not known, a young man without family, in attempting to swim on shore, drowned in the surf. The ship had bilged and was full of water. The masts were cut away, and the sails, rigging and spars were on the beach in a mass nearly destroyed. The ship is lost.—Her cargo, which is very valuable, will, should the weather prove favorable, be saved, in a very damaged state. Should a storm come on, the whole will be lost. The owners have no manifest of her cargo, but the freight lost is over eight hundred pounds. The vessel and cargo will be worth at least two hundred thousand dollars, which being principally insured, will fall heavily on Wall street. There is a large amount of gold on board, which no doubt will be saved.

It will be remembered that Brevet Brig. Gen. D. L. CLINCH was assigned, a few months since, to the command of the United States troops in Florida, and six companies of infantry and artillery were placed under his orders. This force, it was thought, would be sufficient to preserve the peace of the Territory, and enforce the stipulations of the treaty entered into by the Seminole Indians, for their removal west of the Mississippi.

Recent demonstration on the part of those Indians, aided by the renegade negroes, who find a refuge and shelter among them, have induced an augmentation of the force previously assembled in Florida. Four companies of artillery, under the command of Lieut. Col. FANNING, have just been ordered from Fort Monroe to Fort KING, and, if it should be found necessary, General CLINCH is authorized to order the company of infantry now stationed at Key West.

This force, consisting of ten or eleven companies, will be ample, and must convince the Indians that the execution of the treaty on their part will be required of them.—[Army and Navy Chronicle.]

BATTLE BETWEEN THE INDIANS AND POLES.—It appears from a letter received this week from a respectable Polish emigrant, at New Orleans, that about 20 of his countrymen, not meeting with any means of support, and totally without funds, departed from New Orleans for Mexico, by land, through the Texas country. Having no guide, nor knowledge of the wilderness route, they became utterly lost, when they were fiercely attacked by a numerous body of Indians. The Poles had but few guns, but maintained a long and bloody conflict, until they had killed a large number of their enemy. They, however, suffered severely, having had two of their number slain, and the remainder wounded. Only one Pole was able to reach New Orleans.—[Louisville Journal.]

Theatre turned into a Church.—For several years past the proprietors of the Tremont Theatre at Boston have been lessees of the Federal Street Theatre, at an annual rent of \$3,500! These lessees have recently under let the building to several gentlemen at \$1,500, on condition that they shall not use it as a Theatre, but as a Church.—[Journal of Commerce.]

A petition was presented to the Chamber of Deputies on the 10th of January, from the ship-owners of Marseilles, Nantes, and Havre, praying that the commercial navy (or merchant service) be separated from that of the King—in short, and in other words, that impressment be prohibited for the future. Mr. Tupinier, (who is Director of the Harbors of France,) opposed the petition, on the ground of the inexpediency of altering the present system "at a moment like the present, when France might have to contend with a great maritime Power." (alluding to the point at issue with the United States of America.) Admiral Dupine followed, stating his surprise that the petitioners should have selected "such a time as this" for making such a demand. The petition was, of course, rejected.

We regret to state that the fine steamer *St. Wipreffe*, which plied between Marseilles and Naples, has been destroyed by fire. The *Garde National* of Marseilles of the 7th inst. contains the following particulars of this disaster:—"The vessel arrived at Naples on Christmas-day, at half past 4, and was admitted into port at 5. The passengers landed, but, on account of the solemnity of the day, the disembarkation of their effects was deferred until the following morning, and three men were left on board to guard them. At 8 o'clock a fire broke out in the vessel, and the ships of war in the port towed her into the roads, but she was burnt down to the water's edge. Of 67 ingots of gold or silver which were on board, two only were missing, and it is still hoped they will be recovered. Coupons of Neapolitan rentes, in value from 35,000 to 40,000 ducats, have been lost. The same securities, amounting to from 15,000 to 20,000 ducats, were saved. A packet, containing to the value of 3,000 ducats, was found floating about two miles from the place of the disaster." It is said that many of the lost coupons belonged to the Paris house of Hagerman and Odier.—[Paris paper.]

The Duke of Leuchtenberg, the husband of Donna Maria, now called Prince Augustus of Portugal, will leave town on Sunday; he will dine at Salisbury the same evening, be at Exeter on Monday, and embark for Lisbon on Tuesday, on board the *Monarch* steam-vessel, prepared for his reception at Falmouth. His departure from England would have taken place earlier, but for the desire he entertained of returning in a proper manner the hospitable and distinguished attentions which have been paid him, and of making himself acquainted with the leading men of a country which he hopes to attach to a still closer union with Portugal, the country of his adoption. The strength of these motives may be judged by the natural impatience the Prince feels to proceed to Lisbon. The impression he has made here on all to whom he has been introduced has been decidedly favorable, both from his amiable manners and the knowledge and just principles which he has displayed on political subjects. This is important, as the known attachment which subsists between him and the Queen, so unusual in Royal marriages, will probably give him great weight and influence in the councils of the Government. The Prince dined on Wednesday with the Duke of Wellington, and yesterday went to Brighton on a visit to the King.—[Times of 16th.]

A FUNNY MAN—Fun is to me what ale was to Boniface. I sleep upon fun—I drink for fun—I live upon fun, hence our dear funny friends just suit me—they do nothing but laugh; they laugh with one when present, and at one when absent—but to me that is the fun—I admit myself fond of practical joking, I don't mean in one's own particular circle; there it is dangerous; people are not always in the same humor; what they think uncommonly good fun one day, they will seriously resent as an insult the next. There's no judging with certainty a man's temper of mind, and it is not easy to ascertain how much melted butter a gentleman would like to have poured into his coat pocket without kicking; I avoid that sort of thing, but on the great scale I confess my addiction. Coming here yesterday evening, I stopped the chaise at the corner, of Egham, in order to turn the finger-post at the corner, half round; sent all the people bound for London to Chertsey, all the people destined for Egham to Windsor, and all the people destined for Wind-

oor to London—that's my way. I've whipped off ever knocker in Sloan street three nights running—a hundred and ninety-four, exclusive of shops; and if ever the project of lighting London with smoke should be brought to bear, I flatter myself you will hear of my darkening the whole parish of Pancras, by grinding a gimlet through a gas pipe! These frolics cost something occasionally, but what of that? Every man has his pursuits—I have mine.—[Theodory Hook.]

SWISS CONFEDERATION.—It is affirmed that the Note of the Germanic Diet will contain categorical demands, 1st, that the Confederation shall force the Cantons to submit themselves to the resolutions of the Helvetic Diet, and that it shall not be allowable for any minority to make a declaration, or protest of reserve; 2d, that the Helvetic Diet shall watch over the execution of the resolutions of the Vorort; 3d, that the Confederation shall pronounce a formal censure as to the affair of the workmen of Berne.—[Republican Suisse.]

The opening of the new year has been marked by the removal of the Vorort to Berne, to the great joy of the inhabitants of Zurich; the archives of the Diet have also been removed thither. The Burgomaster Hirszel will rejoice at being at length delivered from the annoyance he experienced from the affairs of the Diet.—[Svabian Mercury.]

GERMANY.—Two Congresses are preparing for the month of April next. The one to consist merely of Ministers of the Germanic States, is to assemble at Vienna; the other, of the great crowned heads of Europe, will be held at Berlin.

The meeting at Vienna would have for its special object, to examine into the situation of Germany, and respecting the results obtained from the repressive institutions that the alarmed Holy Alliance has imposed upon the Germanic people. Afterwards it will be endeavored to counterbalance the immense advantages which Prussia derives from her system of customs; and Austria will endeavor to seize again upon that influence over the destinies of the Germanic Constitution, which is escaping from her hands. These are said to be the reasons why there is to be, once more, a conference at Vienna.

The object of the Congress at Berlin, will, it is said, be of greater importance—namely, to examine into the state of Europe. This examination could not be completely gone into at the time of the late visit of the Czar at Berlin. The Tory Administration was not constituted at that period.—[Messenger des Chambres.]

BERLIN, Dec. 26.—The *Times* gives a letter from Alexandria, which says that Marshal Marmont had arrived there on a mission from the Russian Court, to effect a reconciliation between Mehemet Ali and the Porte, and that it is possible that the French Marshal may take the command of the Egyptian army. A correspondent of the *Allgemeine Zeitung* writes to the same effect from Constantinople. There appears to be a great error here. In the first place, it is not probable that Marshal Marmont has received any commission from Russia. No one can positively affirm that he has not; but then, even were this really so, it might be difficult to explain how the Marshal could appear in Alexandria at the same time as mediator, and with a view of commander-in-chief the army of Mehemet, who is the adversary of the Porte. If he really wished to offer his services to the Pasha, it must certainly be in the view of being useful to him either in the field, or by the organization of his army in time of peace. But neither would be compatible with the part of a mediator, and it would be very strange for the Marshal to perform it in such a manner; for if he went to Alexandria as a messenger of peace, it would be doing the Porte an ill service if he should at the same time offer his talents and experience to the Pasha, and suggest to him the means of more effectually making war on the Sultan either now or at some future time. This would by no means harmonize with the prudent conduct of the Russian Cabinet. The able journal in question seems on this occasion to show but little tact, and by no means to be acquainted with the views of the late English Cabinet respecting the

affairs of the East, in which views, so far as is known here, the Duke of Wellington participates. The East no longer affords any reason for apprehension respecting the preservation of general peace in Europe; and if some misundstandings still prevail, if there is still some want of cordiality between the Porte and Mehemet Ali, this will soon be remedied by the joint efforts of all the Cabinets.—[Allgemeine Zeitung, Jan. 4.]

Coldridge made prodigious efforts to relieve himself from the thralldom of opium-eating, and he went so far at one time in Bristol, to my knowledge, as to hire a man for the express purpose, and armed with the power, of resolutely interposing between himself and the door of any druggist's shop.—[De Quincey, in *Tait's Magazine*.]

NEW YEAR'S DAY IN PARIS.—The usual quantities and variety of *bons bons* are displayed in the shops, and crowds of idlers lounge about them at all hours of the day and night. It is a most official day for all the *bons Parisiens* this same *journée de l'an*. Many a reluctant giver is forced to great straits and savings for the last month or two of the year, in order to be able to give what is expected of him at every house he is in the habit of frequenting. Even ladies of the higher and highest classes of society expect or accept a present of some kind from each of their acquaintance. A nosegay (they are made very elegant for the occasion) is the smallest offering where money is not to be given, and nosegays on that day are not to be had for less than four or five francs each. It is calculated that the sums laid out in Paris only in *bons bons* and in nosegays on New Year's day amount altogether to somewhere about five millions of francs (£800,000.) Let your political economists decide whether this money is lost to the community, or promotes its prosperity.

PARALYSING DEATH FROM COLD.—The long continued action of snow or cold on the animal frame is an inevitable death, and that of the most planning kind. At first a degree of languor is felt; to this succeeds an irresistible drowsiness, which if indulged in, is surely fatal—the sufferer passing, without motion or pain, from the chamber of life into the cold sleep of death, leaving the countenance as calm and placid as if the pulse of existence still vibrated through the frame, while voluntary muscular power was quiescent under the delightful enjoyment of profound repose.—Those who feel the pleasurable moments which intervene between the state of consciousness and unconsciousness on approaching sleep, when indistinct visions, and indescribable emotions are experienced by the guileless, may readily conceive the exquisite mode in which the terrific influence of frost softens the iron grasp of the grim tyrant.—[Martin's History of the British Colonies.]

HOW TO PRESERVE GAME.—Where the grouse are found in the hollows, and the soil is boggy, and consequently fall into puddles or swampy ground when shot, they should be carefully wiped dry with a towel or handkerchief; this applies to all kinds of birds, but more especially to snipe.—Half of the snipe that are killed fall into water, and in this state are poked into a game bag, and in a few hours become a mass of carrion. The delicate long-bill should be swung backwards and forwards until the moisture is shaken off, and then wiped quite dry, and hung by the legs to the strap around the attendant's waist. On arriving at home they should be laid in a warm dry place, and if any of these dainty birds be intended for a present, and to be sent to any distance, the following recipe will be found an excellent preservative; this wrinkle was afforded me by my excellent friend and gnostic sportsman, Major B. When your snipe are dry, insinuate a pepper-corn in each eye, one in the bill, and another in the vent, and sprinkle them under the feathers with fine white pepper; they should be rolled up in nettles or fine paper, separately, and they will keep, though closely packed, for a long time.—Every bird of game, in fact, is the better for this precaution, and the satisfaction that must accrue to the receiver, as well as the donor, must pay the additional pains bestowed upon the preservation of the gift. Hares even may be spiced in this way.—[The Sportsman.]

**AMERICAN LITERATURE.**—The scornful question in the *Quarterly*, "Who reads an American book?" drew forth the ire of every review and newspaper in the United States. A more sensible question would have been, "Who reads an American book, in America?" The good people of the United States are the greatest readers (of every thing except their own books) in the world; they "eat paper, as it were, and drink ink." A novel of Bulwer's is republished in three days after it arrives in the *Swift* packet from Liverpool; and in three weeks it is read in every settlement and cabin in Louisiana, and criticised in every one of the thousand or two newspapers between the Atlantic and Mississippi. And from Bulwer downwards,—the most still-born or unheeded of romances, poem, or what not, comes forth as instantly, in a cheap edition, and is bought up, and solemnly noticed and praised in every corner of that immense country. Nothing is more common in England than to hear small authors talking of their "American reputation:" it consoles them for their neglect at home.—They see their names in the *Chillicothe Banner*, of the *Kentucky Champion*, with four columns of extract, and an editorial critique—and say to themselves, like Byron, when he heard that a volume of his poems had been seen in Albany, "This is fame!" There are American books, however, which the Americans read—those which have been praised in England. Fenimore Cooper's admirable novels; Washington Irving's works; Miss Sedgwick's womanly and clever tales; and Bryant's poems, (edited by Irving, and published in London,) are all very popular—once stamped with English approbation. Even the great Channing, though always revered for his piety and eloquence by the immediate circle of his sect, was never generally known and admired in America, as the most powerful writer of his time, until the echo came back from England. Then, indeed, his essays were reprinted, and his works collected into a volume, and all the newspapers mentioned the fact that they "had been favorably noticed in England."—Words could convey no more.—[Athenæum.]

A medal has been struck at the Hague in commemoration of the choice of His Majesty the King of the Netherlands as arbitrator of the territorial differences between England and North America. The medal represents the bust of the King, and the inscription (in Latin) "William I., King of the Netherlands, Grand Duke of Luxembourg;" on the reverse, with an oak leaf wreath, "Chosen by the English and North Americans as arbitrator of their territorial differences, 1829." [Dutch paper.]

It appears that the present constituency of Scotland amounts to 72,985—viz., 36,823 for counties, and 36,162 for burghs.

The attention of the public is at this moment attracted to the construction of a steamboat, by M. Segnier, jun., at his yard in the Rue des Magasins, Faubourg Poissonnière, upon the plan of M. Burden, in America, and which is employed on all the rivers of that country. According to this principle, instead of the bottom of the boat being in the water, it is floated upon two cylinders, one on each side, the diameters of which are greatest in the middle, and tapering gradually towards each end till they terminate in a point. Upon these cylinders, lying parallel to each other, is placed the deck, or body of the boat. The steam engine is fixed in the middle, having but one paddle, which works between the two cylinders, the points of which are always above the surface of the water—the entire weight of the vessel is so calculated that the water-mark never rises above one-half of the diameter at the widest part or centre of the cylinders, so that the friction of the water is rendered as trifling as possible, and the vessel moves with an almost wonderful degree of velocity. The boat building by M. Segnier is, we believe, only intended as a model; the cylinders are 100 feet long, and their greatest diameter 3 feet. The engine is to be of eight horse-power, and the width of the paddle is 6 feet. It is calculated to carry between thirty and forty passengers. We doubt not that if, on trial, the experiment is found to succeed, a company will have a certain number of boats built in the spring, upon the

same construction, to ply upon the Seine between Paris and Rouen. There are vessels upon this construction on some of the rivers of America of sufficient magnitude to convey 600 and even 800 passengers.

**TASTE OF THE GYPSIES.**—The upper part of the wood (in a picture of Gainsborough's) is tenanted by a horde of gypsies; their asses are grazing among the glades; the party-colored coverings of their wandering camp are visible among the shafts of the trees, and a thin and scarcely distinguished smoke curls slowly away amid the boughs of the forest. This is one of the painter's marks to indicate great and natural beauty of scene; he knew that the taste of that roving people was, as far as regarded a feeling for the charms of external nature, essentially poetic. If a lovely spot lies within their line of march, there they will fix their tents and make their abode for the night; were landscape painters to follow their footsteps, and paint the scenes in which they establish themselves—they would not fail to produce a series of fine poetic compositions.—[Major's Cabinet Gallery.]

**GAUCHOS OF THE PAMPAS.**—The gaucho does every thing with his horse, and seems to be a mere nobody without him. He is forever on horseback, which may in some degree account for these animals being exempt from drawing their carts. If they want any thing from the most trifling distance, they mount their horses for it: they sow their grain on horseback, they carry their dead to the burying ground on horseback, and they have been even known to go begging on horseback. It may be readily imagined from this, that they are good horsemen, and really deserve the good character they bear in this particular; but they are by no means so careful of their animals as might also be supposed. The Arab is proud of his horse, but the gaucho of Monte Video has no such feeling. When he stops at any resting place on a journey, he ties his fore legs together and lets him shift for himself as well as he can, knowing that in this condition he can always catch him by means of his trailing lasso. The gaucho wraps himself in his poncho, and lays himself on the ground with his saddle for a pillow. He is regardless of laying in a store of provision, for with his lasso he can at any time take a bullock and satisfy himself with his flesh. He cares not for bread—animal food is all he requires. I have been informed from high authority, that, in order to cook the bullock after he has been killed, a part of the animal is used as fuel, so great is the deficiency of this article in the extensive plains called Pampas. The dress of the gaucho is becoming. His complexion is a swarthy brown, his hair is generally black and long, sometimes platted and surmounted by a small-brimmed, neat-looking hat. His shoulders and body are concealed by his poncho, which hangs gracefully around him, and by the variety and mixture of its colors, in which bright scarlet and yellow are sometimes particularly conspicuous, adds much to its general effect. It descends only low enough to leave the fringe of his white trousers conspicuous over his feet, which frequently are uncovered either with shoe or stocking. Thus attired he makes an odd appearance on his horse, sometimes with his dalcinea behind him, a favorite madrigal with his guitar in the true spirit of chivalry and romance.—[Voyage of the Chanticleer.]

**SOCIETY AT CALCUTTA.**—People do not come here to live, and enjoy life; they come—and this is the case in all states of society here—in order to gain something to enjoy life elsewhere. There is no such a thing as a man of leisure at Calcutta. The Governor-General has the most to do; next to him the Chief Justice; and, after these, the Advocate-General, and so on. It is almost wholly among this class of men that some are to be found whose taste for study can enable them to steal a few moments of leisure amid the duties of their station. All who are not men of highly-gifted intellect soon lose their energy, and yield to disgraceful indolence. Immediately below the high ranks you find the most vulgar and common rabble; yet, for a truly small number of Europeans, there are journals without number, both political and literary; there are learned societies, or societies calling themselves such, of every de-

nomination—craniological, phrenological, horticultural, literary, medical, Weatherian, and I know not how many besides—whose members scarcely yield either in science or appetite to similar institutions in the United States.—[Jacquesmont's Journey to India.]

The *ci-devant* King of Sweden has just published a pamphlet in French, entitled "The Thirteenth of March, or Essential Facts of the Revolution of 1809; by Colonel Gustafson."—"The author," says a *Hamburg paper*, which gives an account of the pamphlet, is still an absolute Legitimist. He cannot conceive how, under any circumstances, Governments can capitulate with Revolutionists. Having inherited from Gustavus III. an implacable hatred of the French Revolution, as well as a profound aversion for the liberties enjoyed by the States-General, he saw in Bonaparte nothing but a child of that revolution, an upstart, who set up the pretension of taking rank with kings, and even of imposing laws upon them. Col. Gustafson cannot conceive how a King could deign to treat with Napoleon. The old King of England and young King of Sweden, says the *ex-King*, constantly and energetically opposed the omnipotence of Napoleon. The writer confesses, however, that the King of Sweden is a fit of ill humor caused the arrest of Sir John Moore, an English General, who was charged with an important negotiation, but who did not proceed with sufficient dispatch. This was neither diplomatic nor conformable to the law of nations, and he repents of having taken this step; but this was not the only act that ruined him—it was the decisive abandonment of all his Allies, caused by his attachment to legitimacy, and his hatred to Bonaparte. The *ex-King* proves, what by the bye was well known, that his abdication was not voluntary. He gives an account of the violence exercised against him, how he was arrested in his palace, and how, after having attempted to escape by a secret stair case, he had thrown the keys in the face of Gen. Aldercreutz. Comparing the revolutions of other countries with that of which his *ci-devant* Majesty was a victim, he concludes his pamphlet by the following prophecy:—"If Divine Providence does not interpose in a direct manner, we shall soon see treason, perjury, and usurpation take the places of loyalty, fidelity, and legitimacy."

**A LARGE SPIDER.**—At the end of last week, as some sawyers at the Molyneux logwood mill, Prestwich, Lancashire, were engaged in rasping a small block of logwood, they came to a hole in it, from which a large spider crawled. It was at first supposed to be a tarantula spider and its extraordinary dimensions somewhat alarmed the workmen, who were little prepared to meet with so unwelcome a visitor, but this opinion was borne out by that of the scientific gentlemen who have examined it. Its body is about two inches and a half long, and one thick. Its color dark brown; has ten legs of great length, and eight eyes, the nippers are black, horny, and sharp, but not serrated; they were hardly discernible until a piece of quill was inserted, and then they were found to contain a small house fly, which it must have caught after its liberation. There are no antennae visible. The body is covered partly with long red hair. Its weight is half an ounce within a few grains. It will be evident from the description that it little resembles the tarantula, which is besides seldom found but in Italy (Apulia), Cyprus, Barbary, and occasionally in the East Indies. Logwood is brought almost exclusively from Campeachy and the West Indies. It is probably the great American Spider spoken of by Buffon, with the description of which it very nearly corresponds. The hole which the spider occupied is about six inches and a half in length and rather more than two in diameter, and in the very heart of the tree. The tree from which the block was sawed was not a large one, and is supposed to be under twenty years' growth. It is conjectured that an egg from which this spider has sprung was deposited in some little hole of the tree when a sapling, and was thus closed up in his cell for so long a period. Since its release it has become very torpid, and it appears doubtful whether it will live. It is to be placed in the Museum of the Natural Society at Manchester.

## RAILROAD AND CANAL MAP.

THIS long promised Map is now ready for those who wish it. Its size is 94 by 40 inches. It is put up in a convenient pocket form, in morocco cover, and accompanied by over 70 pages of letter press, giving a concise description of, or reference to, each Road and Canal delineated on the Map. It will also be put up in *Marble Paper* covers, so as to be forwarded by mail to any part of the country; the postage of which, cannot exceed 44, and probably not 25 cents, to any part of the country.

Published at 35 Wall street, N. Y., by  
D. K. MINOR.

**MECHANICS' MAGAZINE**, Nos. 1 and 2 of VOLUME 5, for JANUARY and FEBRUARY, 1835.—The two first numbers of volume 5 are now published and for sale at 25 Wall street, and at the principal bookstores. These numbers contain a great number and variety of articles, both useful and entertaining; and are printed in a style altogether superior to any of the preceding numbers of the work, and an effort will be spared to render the work equal to any other of the kind published.

Bound or stitched volumes may be had single, or in complete sets, at the office No. 35 Wall street, of  
D. K. MINOR.

## AGENTS FOR NEW PUBLICATIONS.

**HENRY G. WOODHULL**, of Wheatland, Monroe county, New York, is agent for the following Publications: The New York American Daily, at \$10.00—Tri-Weekly, at \$5.00—Semi-Weekly, at \$4.00 in advance. The American Railroad Journal, Weekly, at \$3.00 per annum.

The Mechanics' Magazine, two volumes a year, at \$2.00 per annum.

The Quarterly Journal of Agriculture and Mechanics, at \$5.00 per annum, or \$1.25 per number.

The Family Magazine, 416 pages a year, at \$1.50 in advance.

The Monthly Repository and Library of Entertaining Knowledge, of 36 pages a month, at \$1.00 in advance, now in the 5th volume, bound volumes \$1.25.

The Ladies' Companion, of 34 pages a month, at \$3.00 per annum, in advance.

The Rochester Gem, at \$1.50 in advance.

All Communications addressed to me, at Wheatland Monroe county, will be promptly attended to. September 18, 1834. n8v6 Cif.

**TOWNSEND & DUFFEE**, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of *Duffee, May & Co.* offer to supply Rope of any required length (with-out spikes) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jarvis, Eng. M. & H. R. Co. Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania.

Hudson, Columbia county, New York, {  
January 29, 1835.

## PATENT HAMMERED SHIP, BOAT, AND RAILROAD SPIKES.

Railroad Spikes of every description required, made at the Albany Spike Factory.

Spikes made at the above Factory are recommended to the public as superior to any thing of the kind now in use. Ship and Boat Spikes made full size under the head, so as not to admit water.

Orders may be addressed to Messrs. **ERASTUS CORNING & CO.** Albany, or to **THOMAS TURNER**, at the Factory, Troy, N. Y. sept. 12 y

## SUPERIOR GARDEN AND AGRICULTURAL SEEDS.

The Subscriber has now on hand a full supply of Garden and Field Seeds, growth of 1834; among which are all the finest cabbages, cauliflower, broccoli, radishes, peas, &c. that are cultivated in England, France, and Holland, together with every sort that can be raised to advantage in our own country, and which are grown expressly for my use from stock furnished and raised by the most experienced gardeners in this country; in short, every article emanating from my store, I warrant genuine and fresh.

Also, skinned oats, potatoe oats, 44 lb. weight to the bushel, perennial rye grass, white clover, lucerne or French clover, orchard grass, Herd's grass, white mulberry, and yellow locust seeds, spring tares or vetches, genuine mangel wurtzel, and ruta baga, and field turnip seeds, well worth the attention of farmers.

Canary, Hemp, Rape and other bird seeds; wholesale dealers supplied on accommodating terms. Price lists by the pound and bushel furnished on application, as also catalogues of whole collection.

The flower seed department embraces the choicest variety to be found in this country, in which are included choice double double Dahlia seed, carnation and choice Pinks, German and China Asters, splendid double balsams, with an addition of several new varieties, accompanied with a printed direction for culture and management.

Orders will be punctually attended to and carefully packed and forwarded as directed, but as the collection of distant debts are often troublesome and sometimes impracticable it is desired that satisfactory reference be made to persons in Albany, when the order is not accompanied with the money.

W. THORBURN.

347 N. Market st. (opposite Post Office.)  
Mr. Thorburn is also Agent, and will at all times receive subscriptions, for the NEW YORK FARMER and American Gardener's Magazine; QUARTERLY JOURNAL of Agriculture, Mechanics, and Manufactures; MECHANICS' MAGAZINE and Register of Inventions and Improvements; and the AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; published at No. 35 Wall street, N. Y., by D. K. MINOR, F—feb 11

## RAILROAD CASTINGS.

**MANY & WARD**, Proprietors of the Albany Eagle Air Furnace and Machine Shop, will make to order car wheels, chairs and knees, and every other description of castings required for railroads. R-ly feb 14

## NOTICE TO MANUFACTURERS.

**SIMON FAIRMAN**, of the village of Lansingburgh, in the county of Rensselaer, and State of New York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, and its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh. August 18, 1835. A29 of R M & F

## PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent), are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

Troy, N. Y. July, 1831.

Spikes are kept for sale, at factory prices, by J. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. I. Brower, 223 Water street, New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Bagand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes. H. BURDEN.

## MILL DAM FOUNDRY FOR SALE.

The Proprietors of the Mill Dam Foundry offer for sale or lease, their well known establishment, situated one mile from Boston. The improvements consist of

No. 1. Boiler House, 50 feet by 30 feet, containing all the necessary machinery for making boilers for Locomotives and other steam Engines.

No. 2. Blacksmith's Shop, 50 feet by 90, fitted with cranes for heavy work.

No. 3. Locomotive House, 54 feet by 35, used for putting together Locomotive Engines. Several of the best Engines in use in the United States have been put in this establishment.

No. 4. A three story brick building, covered with slate, 190 feet by 46, containing two water-wheels, equal to 40 horse power; Machine Shop, fitted with lathes, &c.; Pattern Shop; Rolling Mill and Furnaces, capable of rolling 4 tons of iron per diem, exclusive of other work; three Trip Hammers, one of which is very large; Engine for blowing Cupola Furnaces, moved by water-wheel; one very superior 18 horse Steam Engine, which could be dispensed with; and a variety of other machinery.

No. 5. An Iron Foundry, 80 feet by 45, with a superior air Furnace and two Cupolas, Co-oven, Cranes, &c. fitted for the largest work. Attached to the Foundry is a large ware-house, containing Patterns for the Castings of Hydraulic Presses, Locomotive and other Steam Engines, Lead Mill Rolls, Gearing, Shafts, Gears, Grates, &c. &c. These were made of the most durable materials, under the direction of a very scientific and practical Engineer, and are supposed to be of great value.

No. 6. A building, 65 feet by 36, containing a large stock of chimneys, and furnaces, for making Cast Steel. This building is at present used as a boarding-house, and can accommodate a large number of men.

No. 7. A range of buildings, 500 feet long by 36, containing counting room, several store rooms, a Brass Foundry, room for cleaning castings, a large loft for storing patterns, stable for two horses, &c. &c.

The above establishment being on tide water, presents greater advantages for some kinds of business than any other in the United States. Coal and Iron can be carried from vessels in the harbor of Boston, to the wharf in front of the Factory, at 25 to 30 cents per ton. Some of the largest jobs of Iron work have been completed at this establishment; among others, the great chain and lift pumps for flooding the Dry Dock at the Navy Yard Charleston.

The situation for Railroad work is excellent, being in the angle formed by the crossing of the Providence and Worcester Railroads. The Locomotive "Yankee," now running on the latter road, and the "Jonathan," purchased by the State of Pennsylvania, were built at these works. With the Patterns and Machinery now in the premises, 12 Locomotives and as many tenders, besides a great quantity of cars and waggon, could be made per annum.

For terms, apply to  
THOS. J. ECKLEY, Treasr. &c. Boston, or to  
ROBERT RALSTON, Jr., Philadelphia. J  
Boston, Dec. 30, 1834.

## STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads.

No. 264 Elizabeth street, near Bloeker street, New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad now in operation. J25 of

## RAILROAD CAR WHEELS AND BOXES, AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscriber at Paterson, or 60 Wall street, New-York, will be promptly attended to.

Also, CAR SPRINGS.  
Also, Flange Tires turned complete.  
J8  
ROGERS, TUCKER & GROSVENOR.

## RAILWAY IRON.

35 tons of 1 inch by 1 inch,	Flat Bars in lengths of
300 do. 1 1/2 do. do.	14 to 16 feet, counter sunk
40 do. 1 1/2 do. do.	holes, end cut at an angle
300 do. 2 do. do.	of 45 degrees, with splicing
300 do. 2 1/2 do. do.	plates and nails to suit.

3250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rails of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Also, of 24, 26, 28, 30, 32, 34, and 36 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and incorporated Governments, and the Drawback taken in part payment. A. & G. RALSTON.  
9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them. 471mcw,

## SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by

E. & G. W. BLUNT, 154 Water street, corner of Maiden lane. J21 of

## SURVEYING AND ENGINEERING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new, among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also a Railroad Goniometer, with two Telescopes—and a Leveling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,  
Mathematical Instrument Maker,  
No. 9 Dock st., Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested. Baltimore, 1834.

In reply to the inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a leveling telescope, in place of the vane sight, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,  
JAMES P. STABLES, Supt of Construction of Baltimore and Ohio Railroad. Philadelphia, February, 1835.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully commend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

Germanstown, February, 1835.  
For a year past I have used instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, MARCH 7, 1834.

We have this week devoted more than our usual space to local, or our own State works. We shall give early attention to several reports relative to other works, now on our table.

We ask attention to the article in this number from the Oswego Palladium, relative to a ship canal, and the communication with the Canadas—it will be found of interest.

Also to the article from "Cincinnatus," on page 138, relative to the Black River Canal, State appropriations, &c.

☞ The Editor of the Railroad Journal presents his compliments to the merchants of New-York, and requests them to furnish him with a statement of the amount of merchandize, or the number of boxes, sold to merchants and others residing southwest, and beyond Pittsburgh and Lake Erie—which have found their way through other States, but would probably have passed through our own State, if a convenient and expeditious mode of conveyance was in operation. The object of the above request is to show the importance of an additional and more expeditious mode of conveyance through the State of New-York—and the high interest our merchants have in an early construction of the Erie Railroad, and of its ultimate connexion with the railroad from Nashville to New-Orleans.

We ask attention to the subject of our Western trade, and the importance of the adoption of such measures as will insure the early construction of the New-York and Erie Railroad—and also desire our readers to look at the four great routes from the Atlantic towards Nashville—with a view of determining which ought to be adopted and constructed, to facilitate the intercourse between the Atlantic States and New-Orleans, and the southwest.

We shall endeavor to give in our next number an account of the amount of merchandize sold in this city during the winter months, and requiring a means of conveyance beyond Pittsburgh and Lake Erie, which now finds way to its place of destination either through Pennsylvania, Maryland, or New-Orleans, to the interior of the Western States—and which would, if there was a railroad, pass through our own State, between the closing and opening of our canals.

We ask particular attention to the able and very important speech of Alderman STILLWELL, of the Common Council of New-York, upon the importance of increasing the channels of communication with the West.

We highly approve of the suggestion to establish an "Internal Improvement Department," and hope such a measure may find friends in all parts of the State.

HUDSON AND ONTARIO SHIP CANAL.—We have received, through the politeness of J. E. Bloomfield, Esq., a copy of the report of Mr. E. F. Johnson, who recently surveyed that part of the route between Utica and Oswego. It came too late for this week, but we hope to give some further account of it, and several others which have been received.

QUERY.—What elevation, per mile, may be considered, with locomotive power, equivalent to an additional mile on a level road?

Will some of our railroad friends, who have more leisure than we, please answer the above query?

TRADE OF THE GREAT WEST.—This is a subject in which every citizen of New-York, as well of the State, as the city, has a direct interest. Every owner of the soil, and every practical business man, as well as every day laborer, is, in one way or another, directly benefitted by the transit of produce and merchandise through our territory; and it is therefore the duty of every man to use his best exertions to secure, by all honorable means, the trade of the great West—and we should naturally suppose that every honorable and liberal minded citizen of the State would exert himself to extend, and perfect, such works of internal improvement, as will most effectually secure to our State a transit duty upon the products of the West; and merchandise in return; and to our cities the immense business resulting from such an exchange.

There are few persons, that have not watched closely for fifteen years past, or examined documents with much care, who can appreciate the value of our present works of internal improvement, or estimate with accuracy the rapid increase of business upon those works.

Within our recollection the entire business between the east and west was carried on by teams. The surplus produce was brought down, and the necessities and luxuries of life were taken into the interior, and the far West, by the aid of waggons and sleighs. How, we would ask, could the business of the present day, be conducted by teams? Where would teams be found, and when found, how accommodated on the road? Assuming the tonnage of the Erie canal, for 1834, to be equal to 700,000 tons, it would require 12,963 teams, of six horses each, constantly on the road, to perform the business;—supposing the entire trade to pass from Albany to Buffalo, and each team to take 3 tons at a load, to perform the trip out and in, 600 miles, in 40 days, including Sundays and delays for loading, on an average of 12 miles per day,

for 365 days in the year; and were they to be in one continued column, they would extend, allowing each team 100 feet space, more than 245 miles, and keep in constant use 77,778 horses, besides at least 10,000 supernumeraries to supply losses, &c. This shows the subject in a light more easily comprehended. If we look for a moment at this statement, and estimate the cost of transportation, which could not be put at less than \$2.00 per cwt., or \$40 per ton, for 300 miles, which would amount to *twenty-eight millions* of dollars a year, simply for transporting, we shall appreciate more correctly the value of the present canals, which have been accomplished by the enlightened foresight and liberal policy of our statesmen.

If such, then, are the results of enlightened legislation, and liberal policy—and no one, we apprehend, will deny the fact—or that those residing near the route of these works have been much benefited by them—private property having increased in value *three times* at least the cost of the canals, more than it would have done had the canals never been built—why not continue to pursue that policy? It is now satisfactorily ascertained that the income of the Erie Canal will liquidate its debt in a few years, even if the other sources of revenue, pledged to it, were diverted to new works—then why not pursue a course of policy which, under the administration of CLINTON, placed New-York at the head of the Union? Why do we see gentlemen residing within the influence of other improvements, constructed entirely by the State, and who have been so much benefited by them, as well in a political as a pecuniary point of view, opposed to all new improvements which do not pass their doors? Such a course indicates a contracted and selfish mind—a mind which should never be possessed by men who aspire to be legislators and statesmen. Have we not arrived at our present state of prosperity by our works of internal improvement? Do we not owe to our canal system in a great measure the present highly prosperous condition as a State? If so—and we presume no man will deny it—why not, in a spirit of honorable reciprocity, say to those sections of the state which have not heretofore participated directly in these improvements, we will aid in placing you on equal terms with ourselves, and we will then strive together to improve every avenue of which the country is susceptible, that we may secure the prize for which our neighboring States are now striving. It would seem that, with half an eye, any one might see and appreciate the importance of securing the western trade.

By the annexed map, the prominent routes, or lines of communication with the west and south-west will be seen. NEW-YORK, PENNSYLVANIA, MARYLAND, and VIRGINIA, are competitors. It is often remarked, that "the race is not to the swift." In

this case, however, it will be found that the prize will fall to those who first enter, and leave the field last. The battle is to be fought by us, with steamboats on canals, and locomotive power on railroads, against stationary power on railroads, with numerous inclined planes.

Those States have the advantage of us both in climate and distance, but New-York can reach the Ohio river with less than one-third the elevation which they must surmount. This will, probably, place us on very nearly equal ground; and success depends almost entirely upon who first obtains the trade.

By way of illustration, and to show how wholly inadequate are our means for transportation, to meet the views and wishes of western merchants, it may be in point to say, that, during the month of February and the first five days of March, inst., more than 350 boxes of dry goods have been put up by one house alone, in this city, amounting in value to more than \$100,000, for merchants in Ohio, Kentucky, Tennessee, and the adjoining States, by the way of Philadelphia and Pittsburg; and they will undoubtedly reach their place of destination long before our Canals are navigable.

If one house, and that one not in Pearl st., has sent this amount of goods to Western merchants during the last 33 days of extreme cold weather, who will pretend to estimate the amount sent from this city during the same period? or the amount purchased in Philadelphia, which would have been purchased in New-York, if we could also have furnished an easy and cheap mode of transportation direct to Lake Erie, and through Ohio, by Railroad. No one, except intelligent merchants here, and in Philadelphia, would credit the statement. It would appear altogether incredible.

We are informed that merchants come here, but on finding that they can purchase many articles as cheap in Philadelphia, return and purchase there, to avoid the expense and risk of transportation.

We do not envy our neighbors for possessing the facilities which draw from us this trade, nor for improving them; far from it. We give them all praise for their enterprize, and wish them all possible success, which can arise from honorable competition. Yet we cannot, we frankly admit, pass the door of the enterprising house referred to, and see their numerous boxes marked "Ohio," "Ky.," and "Tenn.," without regretting that that noble enthusiasm—that spirit of liberal and prophetic foresight which guided the councils of our State in '16, '17 and '18, and onward, until the completion of our main canals—should be entirely extinct; nor without a more fixed resolve and determination to do all that is possible, with our means, to arouse once more those whose voice and wishes no one will pretend or dare to dispute—the people—to a just appreciation of the advantages they possess,

as well as of the prize for which we contend, and the competitors with whom we have to contend.

By a reference to the map it will be seen that railroads are made, making, or in contemplation, from New-York; Philadelphia, Baltimore, and Richmond, Va.—all tending to one point, namely, NEW-ORLEANS; and it is a matter of no small moment to either city, that it should have the termination, or at least the *Atlantic* termination of this great mail route and thoroughfare. One or more of these routes will probably connect, at Nashville, with the Nashville and New-Orleans Railroad, which is now under survey, and will, beyond all question, as we are informed by the engineer, be constructed with all possible despatch; and it therefore becomes a matter of vast consequence to the people of this State, that the Legislature of this State should act wisely, liberally, and promptly, in the measure now before them—that the New-York and Erie Railroad may become the eastern termination of the line. The intermediate parts, in the different states, will be constructed, without difficulty, when it is known where the termination is to be.

That we may better understand the matter, let us suppose that the road from New-Orleans to Nashville, Tennessee, was completed, and also that the Virginia railroad, from Richmond to the mouth of the Kenawha, or to Abingdon, Va., the Baltimore and Ohio Railroad to Wheeling, the Philadelphia Railroad to Pittsburg, and the New-York and Erie Railroad to Lake Erie, were all completed; leaving a distance between Nashville and the different terminations something like the following, namely, to Abingdon, Va., about 250 to 300; to the mouth of the Great Kenawha, 400 to 450; to Wheeling, of 500 to 550; to Pittsburg, of about 600; and to the New-York and Erie, of 650 to 700 miles, to complete the chain to New-Orleans. The question naturally arises, which of these routes would be most like to become the great thoroughfare for travel, trade, and the mail?—From Richmond the Abingdon route, probably; but when all interests are considered, another route would most likely be selected. In coming to a just conclusion, it is necessary to understand the character of the country through which the different roads must pass; and when the necessary information shall be obtained, the longest and the shortest will most probably be found the most feasible; but, on the Virginia route, should it be completed, the traveller, on his arrival at Richmond, will then be near 400 miles from the great mart, as we of New-York consider our city. The northern route will, therefore, probably be considered the most eligible on account of the comparatively level country through which it will pass, from its termination at lake Erie, by the way of Cleveland, Sandusky, the Mad river Railroad, to Dayton, and thence

through a corner of Indiana to Louisville, Ky., and thence to Nashville. Now, we ask, is not this a measure of great promise to our State, and especially to our city. It is a measure which will secure to the State of New-York a transit duty on the removal, as well as her citizens a profit on the sale, of her goods. It will also secure to New-York the main travel and mail to New-Orleans, which is of great interest to her; although it has become the fashion of the day to receive mails from New-Orleans at very long intervals—which proves a serious obstruction to business.

The following very appropriate remarks, and extract from a "Report on the Welland canal," are from the Oswego Palladium of 11th February. The remark that "the New-York canals have as yet felt *absolutely nothing* of the Western trade," is true, almost to the letter; as more than nine-tenths of all the business is from our own State, and yet the canal is not capable, at the busy season, to accommodate the business without great delays and hindrance to business men. Yet with this important fact in full view, "the State should not mingle its funds with a private company, nor have any thing to do with a railroad." So says the gentleman who is accommodated to a T, by canals, living as he does where the Oswego canal connects with the Erie canal.

**Trade of the West.**—By reference to the Report on the Welland Canal, it will be perceived it is the opinion of the Directors, that on the completion of the ship navigation from Lake Ontario to the Ocean, merchandize from London may be conveyed to Cleveland, Ohio, for ten dollars a ton. That the present cost of transportation from Montreal to Prescott, on the St. Lawrence, a distance of only 130 miles, is from twelve to sixteen dollars a ton.

We suppose the above estimate of the future price of transportation between London and Cleveland, to be not very far from the truth. But suppose it is utterly extravagant, will it not awaken those whose duty it is to guard the interests of the city of New-York, to inquire at least into the possibility of her being almost totally deprived of a participation in the great trade of the West—a trade, the future magnitude of which is so vast that we scarcely yet perceive the falling of the great drops which denote the overcharge of this cloud. The New-York Canals have as yet felt *absolutely nothing* of the Western trade. Ninety-nine hundredths of the vast amount of property transported on the canals is as yet the produce of our own state, or the demands of its consumption. We ought not to shut our eyes to the fact that the great improvements in Pennsylvania, Maryland, and Virginia, will secure to those States the transportation to and from the middle and southern parts of the great North Western States. If New-York can secure the trade of the northern parts, she will gain enough to satisfy the most ambitious hopes of commercial empire. Let us not then sleep upon our posts while our northern rival is upon the march. It is only by a great navigation corresponding to the works of nature—a navigation which requires no transshipments from the ports of lading, to her own wharves,—that can secure to New-York an equal participation in a trade to which, in

a short period, such extraordinary inducements will be presented to descend the St. Lawrence. Was the British Government ever known to sleep when the interests of British commerce required vigilance? An act of Parliament, or perhaps an order in Council, making a difference of 25 or 50 cents a barrel in favor of flour arriving in Liverpool, or any other British port, from the St. Lawrence, over that arriving from ports of the United States, would at once deprive New-York of almost the whole of the great staple of the West—a mere immunity granted to flour from the St. Lawrence, (such as would violate none of the reciprocities now existing between the two countries,) would accomplish the object. Nay, might not a part of the great internal trade of our own State be withdrawn from her, and the mills of Rochester and Oswego be made directly tributary to British commerce, without the intervention of the Port of New-York. What measure of advantage, then, will the British have over us, when, added to the political accidents alluded to, she will possess a navigation in which the works of art are made to correspond with the grand operations of nature? The period is not distant when a British ship of 300 tons can appear in the harbors of the Genesee and of the Oswego. With this prospect ahead, our citizens are discussing the propriety of making our canals two feet deeper, and some ten or twenty feet wider; and this, too, while it is in the power of the State to construct a navigation by which steamboats may be passed from the lakes to the Hudson, at a much less cost than the proposed enlargement of the canals. Let the canals be enlarged if necessary. It is pretty clear they are hardly now equal to the business of our own State; but the great navigation from the Hudson to the lakes must be made at last, or the Western trade is lost to New York.

We recommend the following passages of the Report to the particular attention of those interested in the navigation of the Lakes:—

"Contracts are entered into for extending the lock at Port Colborne to 125 feet in length—widening the canal from thence to the rock six feet—and cutting a basin for vessels to pass or turn, on the north side of the lock, at the harbor—for deepening the rock excavation at the curve, on the new route, twelve inches—widening the canal from the junction to Port Robinson—making a guard-gate at Port Colborne, and one at the junction—a culvert at Hall Davis's level—and deepening the canal from one foot to eighteen inches, from Campbell's lock to Davis's basin, and the cut from Marlatt's level to lock No. 35 in Thorold—and for extending the west pier at Port Dalhousie in a line with the east.

"Also for deepening and widening the feeder from the junction to the curve, and cutting basins every half mile for the passage of steamboats—making a culvert at Broad Creek, and extending the Berm bank from thence to Cranberry Creek—all of which are now in a rapid state of progress.

"To effect these objects, great sacrifices were indispensable. The canal had to be closed as early as the 15th November, of which due notice was given; and consequently the loss of the greater part of the fall business has been unavoidable.

"It was gratifying to the Directors to witness the readiness with which those interested in the trade entered into their views, and relinquished the remaining bu-

siness of the present year, to insure an early transit the ensuing season.

"The public are generally aware, that one of the most prominent features in this canal is the opening of the navigation before the lower part of Lake Erie is clear of ice; an advantage which, up to the present moment, for want of means, has never been realized, though the nature of the work decidedly admits of it.

"The Directors have named the first day of April of the ensuing season for opening the canal—and they are resolved that the improvements now in operation shall not interfere with that determination. To encourage emulation for an early transit, the Board have offered a premium of one hundred dollars to the captain of the first vessel, over fifty tons burthen, which may arrive at Port Dalhousie, laden with merchandize from New-York, destined for any port on the upper Lakes—and one hundred dollars to the captain of the first vessel, over fifty tons burthen, which may arrive at Dunnville, on Grand River, with produce from Cleveland, or any port above it, destined for New-York market; as they believe an interchange of commodities may take place between New-York and ports on the upper Lakes, by this channel, in ordinary seasons, one month earlier than by way of Buffalo. They will also give the same premiums to the first vessel, over fifty tons burthen, which may arrive at Port Dalhousie, from either Prescott, Brockville, or Kingston, laden with merchandize from Montreal market, destined for the British ports on Lake Erie; or at Dunnville, from Port Stanley or above it.

"The uninterrupted navigation of the canal, throughout several months of the past season, has afforded the utmost confidence to all those interested in it; and owners and masters of vessels are now fully satisfied, that both a profitable and certain business may be transacted through it. In proof of this, the Directors are advised of *twenty new vessels of the largest class being in course of building, on the American side, purposely for this trade.*

"There is also a degree of activity prevailing in the ports on our own side, not heretofore witnessed. Vessels are building, suited to the double voyage, which cannot fail to give an impulse to the western parts of this province, where it has been much required."

The whole expenditures on account of the canal somewhat exceeds \$1,600,000. There has passed through it, during the late season, 570 schooners, 334 boats and scows, and 66 rafts, amounting to about 38,000 tons.

The amount of toll in 1832 was £2,432

" 1833 3,618

" 1834 4,300

¶ The Report states that although the income of the canal during the late season does not present the same ratio of increase as the former, the difference is chiefly to be ascribed to the early close of the navigation, [made requisite on account of repairs,] and the decrease of business in the months of June and July, owing to the total interruption of the navigation of the Ohio Canal. Notwithstanding, there has been a great increase in the transportation through the canal of the principal staple articles which are particularly detailed.

The remainder of the report, being of ex-

reme interest to all New-York readers, we give verbatim.

"By a report of Mr. Mercer, Chairman of the committee on railroads and canals, published the 24th of June last, the construction of a ship canal between Lake Michigan and the Mississippi, by the Illinois river, is strongly recommended to the consideration of Congress. As this is a project in which the whole continent of America must feel a mutual interest, we copy the report of C. Gratiot, Esq. chief engineer.

"It may not be generally known that it requires a canal of only 37 miles to connect the ocean with Lake Ontario, 28 miles to connect Lake Ontario to Lake Erie, and 92 miles to connect Lake Michigan with Illinois river, (the summit of which is but 27 miles,) requiring only artificial ship or steam navigation of only 147 miles to connect the gulphs of Mexico and St. Lawrence, through the interior of this continent. We also insert an extract from the report of B. Wright, Esq. on the St. Lawrence, which cannot fail to impress on the minds of those concerned the decided advantages which must arise to the public by constructing a canal at this point on the enlarged dimensions.

"Although the inhabitants of these Provinces have witnessed the entire loss of the Western Trade, with a degree of supineness not to be satisfactorily accounted for, it is cheering to know that the Legislature of this Province has commenced the improvement of the St. Lawrence on a scale commensurate to the object. The locks are 200 x 55 feet, with nine feet depth of water. It is to be hoped measures will be adopted, the ensuing session, to continue this scale through the Lower Province, which will in effect make those interior waters a sea coast, and extend the commerce of the St. Lawrence beyond the most sanguine expectations of those who may now be considered enthusiasts.

"The difficulties and expense of navigating the St. Lawrence are far greater than is generally supposed. The amount of trade or commerce through that channel is a mere bagatelle, compared with what is directed to the New-York market. It appears that 264,919 bushels of wheat were conveyed through the Welland canal last season; of which only 18,464 bushels came from our ports on Lake Erie, and 22,170 from American ports destined for Montreal market; and the remaining 224,285 were conveyed to Oswego; whereas, if the St. Lawrence was made navigable, it would be difficult prescribing bounds to the quantity which will be diverted by this channel to foreign markets, or the quantity of merchandize in return for the supply of the Western country. It is supposed that merchandize from London would be conveyed to Cleveland for 2l. 10s. per ton, which now costs 3l. to 4l. from Montreal to Prescott, a distance of 130 miles."

NEW-YORK, vs. PHILADELPHIA, BALTIMORE, AND RICHMOND, VA.—NOT IN LAW, BUT IN WORKS OF INTERNAL IMPROVEMENT.—The period has arrived when a statement of facts is necessary to show the importance of an early and decided movement on the part of the State of New-York, if she would retain what she has, and obtain more, of the trade of the far and fertile west.

By a reference to the following outline of

a map, it will be perceived that there are four great lines of communication, all tending to the same point.

Virginia will now push her *James River and Kenawha Improvement*. If this work should, as it certainly will not, terminate at the Ohio river, it will then only require about 400 miles of road to connect at Nashville with the road chartered, and now under survey, from New-Orleans to Nashville. Will Virginia now permit her favorite work to sleep? She will not surely be so unwise, nor will she be satisfied until she connects, either through Kentucky, or by the way of Abingdon, Va., and down the Holston to Knoxville, and thence to Nashville—most likely the latter—that she may secure to herself a share of the trade of those States, and also endeavor to make that the main travelled mail route from New-Orleans to New-York. Maryland and the District of Columbia, also, are training for the same prize; and well they may, for even a *share* of the products of the millions of fertile acres and rich mines west of the Alleghanies, is worthy of all the efforts that are being made for it. The Chesapeake and Ohio Canal, notwithstanding the obstructions thus far encountered, will eventually tap the Ohio; and the Baltimore and Ohio Railroad has been completed too far to be permitted to terminate east of the Ohio River, or some other point equally favorable, to secure her a share of the western trade. It would be unwise to flatter ourselves that these works will not ultimately reach the point of their early destination. The nature of things ensures it; the genius of our country demands it; and the wind or the waves may as well be stayed.

What Maryland and Virginia have resolved, PENNSYLVANIA has accomplished. She was slow to engage; but, once aroused, she drank deep of the spirit of enthusiasm on the subject of internal improvements, which once, more than in any other, pervaded this State; and hesitated not to pledge her credit, to almost an unlimited amount, for the benefit and prosperity of her agricultural, mechanical, and commercial community. She has constructed canals and railroads in almost every direction from her capital; she has not only passed, but *penetrated* her mountains, and *reached* the Ohio; thereby opened a direct communication with the Mississippi. Not satisfied with that, however, she is now pushing her canals, in different places, to the line of our own State, as well as the State of Ohio. Her people do not insist upon concentrating *all* their works in *one* neighborhood; but with a liberality highly commendable to them, strive to spread wide, even to the very extremes of the State, their works of improvement. They do not say to those sections, hitherto excluded,—who now ask aid,—as our worthy friend of the Syracuse Standard says to the southern

counties: "*If the work will pay the interest on its cost, you need no help; if it will not pay the interest, the people for whose benefit it is to be made, must defer their demands until it will.*" Indeed, Sir! is this the way you intend to reciprocate the favors which you have so long enjoyed? Is it indeed so, when, for more than *sixteen years*, the inhabitants of the southern counties have not even been permitted to *salt their porridge* without paying a *direct tax* to promote your interest; and, to our own certain and personal knowledge, have aided in elevating the place in which you live, since 1810, from three *houses, and a horse-shed*, surrounded by marshes, and pools of stagnant water, inhabited by frogs and reptiles, to be one of the most enterprising, prosperous, and respectable villages—we might almost say cities—in the State? As an evidence of the correctness of this statement, we refer to sales of State lands in 1822, in and about the village of Syracuse, that were made at \$7 to \$20 per acre, which could not now be purchased at \$1500 to \$5000 per acre; yet those directly interested in the construction of a railroad, which will not pass through that, almost city, are told by the editor of the Syracuse Standard, that he has "*on several occasions experienced no small degree of surprise at the apparent zeal and earnestness with which the New-York journals have urged, in particular, the proposed railroad through the southern counties.*" —"Nor can he account for their manifestations of good will towards every visionary scheme which radiates from their city, except on a *principle of such loose morality* that he shall not desire to specify," &c.;—and then goes on to say:

"We have remarked, that whenever the enlargement of the Erie canal has been recommended, the measure met with but a cool response, or a silent negative, from the commercial emporium, but if the said railroad, or the aforesaid steam ship canal, was introduced into discussion, all Manhattan was alive to the importance of creating new communications through the State with the far west, to secure its trade and prevent Pennsylvania and Maryland from taking a share in the grand prize held out for Atlantic competition. We say this disposition wears a strange, and almost unaccountable aspect."

There must surely be more than meets the eye—that the City of New-York, dependent as she is upon the prosperity of the *whole interior*, should desire to have the works of internal improvement pervade *all parts* of the country, instead of running *side by side* through any particular part, and especially that which is by many times the most wealthy section of the State! It is, indeed, "unaccountable." It is not, however, a fact, that the "commercial emporium" receives with a "cool response, or silent negative," the proposition to "enlarge the Erie Canal"—altho' it is true, as the liberal minded editor admits, in another place, that its inhabitants "are alive to the importance of creating new communications through

the State with the far West," and they are equally alive to the improving those already made, and to extending them into every part of the State.

"The expense of enlarging the capacity of the Erie canal would be from six to eight millions of dollars. For this sum it can be made to admit vessels of one hundred or more tons, which may navigate the Lake and the Hudson river—receiving and discharging their cargoes, at New-York, and at the ports on the Western Lakes. The consequence would be, that but half of the present number of boats would be required to run on the canal, whilst the capacity of the canal would receive four times as many—thus, when the new description of boats should be exclusively employed, being enabled to bear *eight* times the amount of tonnage transported upon it during the last season. This would be making provision for a distant period of time, and it might be safely left to future generations to prosecute new enterprises for the security of any greater portion of trade which should fall to our share from the west. The superiority of this mode of improving our navigation is too plain and palpable, to admit of question or dispute. It is the mode which nature has marked out, and art never succeeds but where she treads in her sister's footsteps."

Now we have always supposed that "art" and enterprise strayed most strangely, at times, from nature's path. It would at least appear that they were either designed to improve nature's work in many parts of the country, or they have been woefully misapplied by our enterprising neighbors of Pennsylvania and Maryland—where great inequalities of surface are overcome.

The friends of the New-York and Erie Railroad, it would seem, are not the *only* visionaries in such matters—as the following extract establishes:

"The project of a *steam* ship canal is almost too 'sublimely ridiculous' to demand serious attention, and it would certainly pass without attracting much notice, if we did not see a city engaged in surveying its route, and grave chambers of commerce employed in descanting upon its manifold advantages. It is but little less than a proposition to throw away the Erie canal, the proud monument of our public spirit and enterprise, and to hazard 25 millions in opening a new channel, whereupon to transport the same merchandise and produce which finds such an easy transit upon our present communications. Some reasons must be urged in favor of a change of such magnitude, and so we are told, with a becoming affectation of gravity, that the western trade will seek an outlet by the St. Lawrence river, unless we provide new facilities for its transmission to our own seaboard. Every one will perceive the peculiar force of this argument. Another is, that the Erie canal will not do the increased business which will naturally flow upon it. Hence the sage inference is drawn, that, although six or eight millions would place it in a condition to ensure the full purpose of its construction, twenty-five millions should be expended instead, to open a new route by its side, which, when completed, will do no more. But it is not necessary for us to pursue this subject further, for the scheme is not yet sufficiently matured or familiar to convey alarm to sober minded people, nor do we now ima-

gine that it can be ripened into that degree of importance, that will invite more than a casual notice to its impracticable and useless magnificence."

It may not be distinctly recollected by all of our readers, but we recollect as though it were but yesterday, the sage prophecies of the wise men of the same region, relative to the Erie Canal, in 1817 and 1818—they "desired *only* to live until Clinton's 'big ditch' should be completed"—the wisecracks of the present day may be as much disappointed.—We will not reply to the *insidious* insinuation, that it is the desire of any friend of other improvements to "throw away the Erie Canal, the proud monument of our public spirit and enterprise, and to hazard *twenty-five millions* to open a new channel whereupon to transport the same merchandize and produce." It is an unmanly charge, and could only have been dictated by an illiberal and contracted mind.

"At first glance," says the Editor, "the construction of a road through the southern counties is calculated to awaken the jealousy of northern interests. The friends of the canal, and the local interest identified with it, might apprehend a division of trade and travel to an injurious extent, and be roused to an opposition to the southern road on fallacious grounds, if not from a wrong principle. That the southern counties should, if possible, be brought into a participation of the advantages developed by public improvements, will not be denied, nor indeed has it been, for the state has liberally extended its branches from the Erie canal into that region at all the most feasible points, and would undoubtedly continue to do so, if its policy be not suddenly and violently changed. The state ought not, however, to be called on to mingle its funds with a private company—to loan its credit upon doubtful security—or to interest itself, in short, in a railroad at all."

Indeed! "ought not to be called on to mingle its funds with a private company." Very well; from which we should infer that the editor would recommend the State to build the road entirely, but for the next sentence, in which he puts his *veto* upon the granting of aid to these counties by the State, by saying, "the State ought not to loan its credit upon doubtful security"—very doubtful security, that where the company pledges four millions to secure *two*—"or to *interest itself in a Railroad at all*." How, we would ask, were the "Erie and Champlain" canals built? Was it without the aid of the State, because it would pay an *interest* upon its capital? Or was it by pledging the credit of the State, and by taxing the salt with which the day laborer seasoned his scanty meal? and for the benefit, too, mainly, of those who now, because they have grown rich, and hope to grow richer, by the improvements caused by the canal, are exceedingly cautious how they consent to an appropriation for any improvement—shall we be so uncharitable as to say—*unless they are to be immediately benefitted thereby?*

What unbounded liberality must that

heart possess which dictated the following!

"Though we believe the true interests of the southern counties should lead them to perfect their connexion with the grand canal, yet we would not lay a straw in their way, in their accomplishing, by their own means, the work for which they are soliciting the assistance of the state. On the contrary, we would grant them every facility, and bespeak for them the countenance of their northern neighbors—at least, we would deprecate their disfavor."

Would you, indeed, grant them every facility? and bespeak the *countenance* of your Northern neighbors?

Even if the assertion that "*the Southern road is beset with acclivities, and dangerous crossings, and inclined places*," to the extent here designed to be understood, were true,—which we take the liberty to deny,—it would not be sufficient reason why the road should not be made; as it is well known to every intelligent reader in the country, that the Pennsylvania and Maryland roads overcome much *greater* and more frequent elevations; and that both of them have already done a great, and are now ready to do a much greater, business; and will, we predict, become successful rivals of the works in our own State, unless more liberal and prompt measures are adopted.

But the Editor may rest assured, that the people of the remote and unimproved parts of the State will not be satisfied with the "*countenance*" only of their fellow-citizens who are reaping a rich harvest from the canals. They look for something more *substantial*; at last, less likely to be affected by a *self-interest*.

They ask only an *equal* share of public improvements, and will not be satisfied with less.

"The southern road is beset with acclivities, dangerous crossings, and inclined planes, which will preclude the transportation of heavy articles over it. In consequence, it will not divert the business of the canal. Again, the elevation of this road at the highest point is nearly 1700 feet, and the whole course of the road is very undulating. A road on the line of the canal would have less than 360 feet of elevation to overcome after leaving Schenectady, and but 250 west of Utica. Beyond doubt, then, the railroads, now constructing and being chartered, on the line of the canal, would engross the principal travel from the west. There can be no room, therefore, for the collision of rival interests, on the subject of the 'New-York and Erie Railroad,' and we hope none will be imagined where none exists. If our southern brethren decline any closer connexion with the Erie canal, they should be left free to their own choice. If their New-York friends are generous enough to make the road for them, we may admire their spirit, however we may wonder at the occasion. But when they come to the legislature for aid, we must ask leave respectfully to decline any beyond our good wishes. It can never be made the interest or policy of the state to meddle with railroads, to become a partner in joint stock companies, to

loan money out of its impoverished treasury to build up a local interest incapable of sustaining itself, or to shoulder every unprofitable work that may be pointed out, in the general rage for speculation. We hope the legislature will take up the subject calmly and deliberately, and that, if the result should be adverse, as we anticipate, to the people of the southern counties, so far as the application for aid is concerned, the conclusion will be seen, by those interested, to be the dictate of sober reasoning, sound policy, and correct principles."

"Our Southern brethren" do not decline connexion with the Erie Canal—they desire all possible connexion with the canal—they do not, however, "desire" to be compelled to transport their produce and merchandize 50 to 100 miles directly from market, and the same distance on the Hudson River, merely to accommodate gentlemen residing on the canal—when, with a railroad through the southern tier of counties, they might go direct to market, and be again on their farms, or in their stores, before they could reach the Hudson River by the canals.

It is, indeed, to be regretted that the Editor "*respectfully begs leave to decline any beyond his good wishes, when the people come to the Legislature.*" It has not been generally understood here, so far as we can learn, or in other parts of the State in which we are acquainted, that the Legislature of the State of New-York is under the immediate guardianship of the Editor of the *Onondaga Standard*!

We also hope the Legislature will take up the subject; and all we desire is, that the subject may be disposed of upon "CORRECT PRINCIPLES."

*Proceedings in the Board of Aldermen 17th Feb., 1835. Reported for the New-York Daily Advertiser.*

#### ERIE RAILROAD.

The Report of the Special Committee of both Boards in respect of the New-York and Erie Railroad, was taken up. The Report was of great length, and closes with a resolution, That the members of Assembly and Congress, at Albany and Washington, be directed to use their best efforts to promote the success of the petition.

Previous to its adoption, Alderman STILLWELL rose and delivered the following speech, which was taken down at the time:—

I rejoice, Mr. President, that the Councils of the City of New-York have at last aroused from the lethargy which has enthralled them, and resolved to express the opinions of the people of this great city, on the subject of internal improvement.

I rejoice, sir, because I see in it the harbinger of better times and wiser counsels; because I know, that it requires but a knowledge of the true interests of our country, to induce the people to demand from their representatives the earnest prosecution of such measures as will promote the welfare of this great country.

More especially do I appreciate the feeling now evident among the members of the Board and the inhabitants of this city, when I remember that, when the application for the Grand Canal—a work which has benefited this city more than any portion of the State—was pending before the Legislature, it did not meet with that cordial and united support from us which a clear perception

of its advantages would have insured to it. Nay, sir, a portion of our delegation in the Legislature, so far from appreciating the enlarged views and prophetic wisdom of one of the greatest minds which this country has ever known, viewed the project as unworthy the serious consideration of the State. But that mighty mind, which only saw difficulties to encounter and overcome them, met the various obstacles which were presented by those for whose benefit the work was designed; and the waters of the Erie were mingled with the Hudson.

The State owes little to our city for that great work; and I rejoice that an opportunity is now offered to prove, that the lessons of time and experience are not lost upon us—that we now know our own interests, and are prepared to say to the North and West, "Go on, and your commercial metropolis will join hand and hand with you for the accomplishment of every work of improvement which will redound to the common interest and glory of our State!"

The report and resolutions now before the Board, recommending the immediate construction of a railroad by the company already formed, and urging upon the Legislature the necessity and propriety of making such loan of the credit of the State as may be required for the successful prosecution of the work, have been prepared with great care, and distinctly point out the practicability and expediency of opening a railroad communication through the Southwestern tier of counties from the Hudson river to Lake Erie. And I rise, sir, with no ordinary pleasure, to answer the call for such general information as I may possess on this subject.

I am not, sir, of the number of those who suppose that an expression of the popular will on this subject would come more appropriately from our representatives at Albany. Sir, it is the imperative duty of the representatives of the city here, to express their opinion on any and every subject affecting the pecuniary interests of this city. Standing here, in my place, I have on no occasion felt myself acting more closely within the scope of my delegated duties, than in urging the adoption of the resolutions on your table. What measure, tending to facilitate the intercommunication of the interior, does not address itself to the direct immediate and pecuniary interests of the City of New-York. Let it be remembered, sir, that this city contains a population greater than that of either of the States of Rhode Island, Delaware, Mississippi, Louisiana, Illinois, or Missouri; and more numerous than the combined population of the Territories of Michigan, Florida, and Arkansas, together with the District of Columbia. She is equal to one-ninth of the population of the State, and her taxable property amounts this year to 180 millions of dollars, while the state does not exceed 430 millions, —making her liabilities, in case of a direct tax, more than equal to one third of the whole State.

New-York city, in a commercial point of view, is more deeply interested than all the State besides. You will recollect, sir, that the inter-commercial trade of this city is supposed to exceed four hundred millions of dollars, and that her foreign and coasting tonnage exceeds all the other cities in the Union. If this fact should create surprise, with what astonishment do we learn, that the tonnage passed during the canal season, through one lock at Utica, has exceeded the whole amount of our foreign tonnage! Does not this prove, sir, that this city, of all other portions of the State, is deeply interested; and shall she be silent when the subject of discussion is internal improvements? Sir, we are bound to express our opinions; we are the guardians of the interests of a city, the revenue of which exceeds the income of any five States of the Union. Our responsibilities are great, and our duties arduous; and while we do not shrink from the one, we will not fail faithfully to discharge the other. It is our duty, then, to use every exertion to inform the public mind, and push forward the consummation of the great interests that appertain to us as the first commercial city of this nation, and of this continent.

The route, sir, which has lately been designated for the great railroad avenue, was long since under contemplation for the purposes of a canal or turnpike. It has attracted the attention of

many of our most distinguished men, and in many instances has been warmly advocated. To every individual of intelligence, who casts his eyes upon the map of this State, and is acquainted with the quality of the soil, it becomes a matter of astonishment that this route has never been occupied—that the resources we possess have not been applied to connect the city of New-York more immediately with the great lakes. Although, until recently, our trade with the west has been very much confined to the State of New-York, yet the want of avenues has been seriously felt, through which to transport the products of the interior; and no time should be lost in opening an intercourse with the west, which shall not be obstructed by the frosts of winter, or the drought of summer—which will be sufficiently rapid to secure the conveyance of the public mail, and give to our merchants and traders, both in the city and country, a speedy, certain and safe mode of communication.

A railroad through this region is particularly necessary, in consequence of the great and increasing trade on the waters of the Delaware, Susquehanna, and Alleghany rivers. These rivers are early open in the spring, and float to market beyond our State an amount of property exceeding the computation of all who have preceded us. These rivers run through a section of the State but little known to a portion of the citizens of our country; and yet that region contains a population of more than three hundred thousand of as intelligent, independent, and enterprising citizens as can be found in any State in the Union.

I am not disposed to enter into a minute calculation of the amount of trade which can be diverted by a railroad from our southern neighbors, but I may be permitted to say that, from the known fertility of the soil, the amenity of the climate, and the difficulties and dangers of the navigation of the streams referred to, there can be no doubt that the travel and products from the interior, together with the additional merchandize sent from this city to the section lying adjacent to the route proposed, will insure a revenue sufficiently large to cover the interest and expenses of this great projected work.

But, Sir, it is not my purpose to confine my views to the south-western counties of this State. To appreciate fully this magnificent undertaking, we must extend our view over the great waters of the mighty West. In that far country, which is watered by the tributaries of the Mississippi and the Lakes, where, but a short time since, lay an interminable forest, States have sprung into being, and are now densely populating with a race of men, well known for enterprise, and remarkable for intelligence. These States will soon send to market an illimitable amount of the products of the earth, and receive in return the fabrics from the manufactories of the East and of Europe. The intercourse with the great West is without obstruction, after passing the boundaries of this State. We have a lake shore equal to the seaboard of the United States, and open to navigation at all seasons of the year. The only obstacle to a steamboat passage from the Lakes to New-Orleans, lies between the waters of the Michigan and the Illinois, a distance of only 94 miles. And to remove this only difficulty, the General Government have already appropriated every second section of land which lies between the two points to be connected. With an enterprise and intelligence worthy of the State, Illinois is making provision to construct a steamboat canal between Chicago and the Illinois River, of a depth of 15 feet, and a surface of 90.

The State will find very little difficulty in uniting the waters contemplated.

The streams which run into the lake, and those which empty in the river, are known at one point to be closely connected; and it is not unfrequent during the high freshets in the spring to find the waters mingling, and boats of ten tons burthen have been floated from the lake to the river.

When this communication shall be completed, a continuous steamboat navigation will be opened, of more than twenty-five thousand miles, on our western waters.

In addition to this, a canal will soon be completed between the Maumee of the Lakes and the Wabash; and it is also made manifest, that

there is an easy and short cut from the Maumee to the St. Joseph's. This last river empties into the southern part of Lake Michigan, and is said to be navigable more than 130 miles by steamboats drawing 3 feet water. We have also the extended Lake navigation to the north through Lake Superior and Huron, and, returning around the southern side of Erie, we find the Ohio Canals, which open a communication with an immense region of country above and below their junction with the river. To contemplate this boundless country, brought within the water range of these great Lakes, and not feel a desire to secure to our favored city its rich commerce, is to be indifferent to every desire which stimulate men to active exertion. It is unnecessary, sir, for me to dwell upon the value or importance of this great interior trade—a trade destined to surpass that of any country on the face of the globe—swollen by the contribution of our hundred lakes and thousand rivers, which fertilize a soil ere long to sustain one hundred millions of freemen. The commerce of such a country, with such a population, by the unerring rules of arithmetic, would require and sustain a commercial metropolis of five millions of inhabitants. Yes, sir; I assert that this city will have its numbers increased to that size, if its enterprise shall keep pace with its interests, in giving facilities to its interior trade. But, sir, we must be up and doing; we must leave nothing undone, which intelligence, enterprise, and means, can accomplish, to secure as speedily as possible this immense prize. Already have we rivals in the field—competitors of no ordinary consequence. The great state of Pennsylvania, with a perseverance unexampled, and a boldness of purpose which elevates even her high character, has, after years of toil and millions of expense, pushed her improvements to the borders of her State. The supposed impracticable barrier of the Alleghany has been overcome: her canals from the east have moved on slowly, but surely, and now touch the base of the mountain, from which a railroad is thrown over the ridge, and unites at the base on the western side with another canal, which already extends to within seven miles of the line of Ohio, and about 84 miles from the great Ohio canal which empties into lake Erie. This communication, it is said, when completed, will afford to the merchants of the west, a shorter and cheaper route to market than any we now offer them. We all know that these two considerations have a preponderating influence in commerce, and must give a preference to Pennsylvania; especially, when we add to these the further fact, that the Ohio and Pennsylvania canals are open one month earlier in the spring, and continue open more than a month later in the fall. Upon referring to the several reports of the committees of the States of Ohio and Pennsylvania, it will be seen that there is a fixed determination to unite these canals, within the coming year. If this rich trade should be once diverted from our own to any other city, we may then bid farewell to all our dreams of greatness.

It is also said that Pennsylvania, true to her own interests, has increased her already large debt of more than twenty millions, by an appropriation for a canal up to our State on the Susquehanna. She has set apart one million for this purpose; and will bring her works within seven or eight miles of the southern termination of the Chemung canal. This improvement will draw down to that State a great portion of the Susquehanna trade, and be of great advantage to the citizens of our State in that section. And while our own resources are not applied to develop the trade of that region, I can truly say, I congratulate the inhabitants that they find the authorities of Pennsylvania more ready to promote the interests of our country, by wise and judicious improvements, than the legislators of our own State.

Mr. President, the southern tier of counties have heretofore asked in vain. Year after year have they wearied the State with unceasing supplication. Coaxed, flattered, and threatened, by turns, their hopes and fears have been made the sport of political excitement and individual ambition.

Who can look to that region, and view her beautiful valleys and wheat-crowned hills—her mountains and her streams—the great variety of

her soil and productions—her numerous, intelligent, and enterprising population—and not admire the enduring patriotism which induces such a people to remain subject to a control which compels them to be, not only lookers on, but actual contributors, to the welfare of other more favored sections of the State.

They are not only responsible for the payment of the debts incurred for the construction of our works of internal improvements, but they are pressed with a double burthen, and are compelled to contribute to the very works which impoverish themselves, by enabling their fortunate neighbors to undersell them in the market. This devoted region has been repeatedly told by the State, "that her mountains were impassable, and her soil unproductive, and that as nature had not been bountiful, the State would not assist in bettering her condition." Sir, destiny cannot be cheated of her own; and I now predict, that the region through which the Erie Railroad is to pass, will, within twenty years, be the most densely populated and wealthy section in this State. But, Sir, what is now asked for this neglected portion of our State? Not money, Sir! No, Sir; that has been asked until delay has sickened the hearts of her citizens. They now require the State to advance her credit to the extent of two or three millions, *after the work is commenced*; and take a mortgage on the road. With this the Company will be content to proceed, and will prosecute the work with vigor. It is true it is a small request; but having been so often refused, this is all that the friends of this devoted region at present demand; and this, Sir, they do demand, and they call for the judgment of their old associates, and those who are aware of the wrongs and privations which for many long and tedious years they have endured. They are wearied with delay, and have ceased to look to the State for full justice. They have turned their eyes to the enterprise of individuals, and they have not been mistaken. Sir, warmly and sincerely do I congratulate that section of the State that their interests and those of the country are committed to the hands into which they have fallen. The charter granted by the Legislature has been preserved; the stock, to a certain extent, subscribed; and the Company organized. A President and Directors have been selected, equal to any other body of men in talent, energy, resources, and enterprise. In addition to which, they are governed more by a sense of public good than individual gain; and know well the great duty and responsibility which the situation they occupy imposes upon them. Mr. President, if it had been left to myself to single out, in this great State, the individuals into whose hands a work like this should be committed, I could not have found those who would have more fully met my approbation. These men, Sir, are deserving of the full confidence of the public; and their characters give evidence that the work will be completed in the shortest period their means will admit.

A survey of this route has been made, and laid before the Legislature. The result to which the Engineer has arrived is so entirely at variance with all the established and received opinions on the subject, both as to grade and cost, that the obstacles would seem to have been entirely overcome. The objection which has so long existed to the improvement of this country, has vanished into thin air before the researches and report of the Engineer. Late experience has proved that railroads may be undulating; that, instead of 20 feet elevation to the mile, steam cars will overcome 176 feet; and that they can also traverse, without danger, serpentine roads of 500 feet radius. The practicability of this route is placed beyond doubt; and the estimate of about five millions is so far within the supposed cost, that we can no longer doubt the construction of the work.

Its importance and revenue must be immense. Not only will it intercept all the trade going down the Susquehanna, Delaware, and Alleghany, but it will bring the products of the far West to our navigable waters at all seasons. We say all, because railroads, we know, are very little impeded by snow and ice. It will, therefore, have a twelve months' trade; and from this, together with the rapidity with which the cars will move,

it will be able to transport a larger quantity of goods annually than now passes the Erie Canal. We may also add the transportation of the mail and passengers, because it is confidently asserted that the passage through being a distance of 483 miles, can be accomplished in the short period of 48 hours. That the road will prove a very profitable concern, when completed, cannot admit of doubt: the great difficulty consists in procuring so large an amount of money for any purpose, in a country where enterprise is only limited by the want of means.

The cost of a work above the actual value of the labor, is of immense consequence to our people, whether the money be expended by the State or individuals; for if a good work be constructed at a fair expense, the tolls will be much less than if the same work had cost more than its value. This is the great point: and therefore, we should be ever careful that good officers and servants be employed. Individuals are much more likely to economize, and procure the construction of a work for a small sum of money, than the public; therefore, it is generally better to *assist* individuals in a public enterprise, when they *will* undertake it—than become the sole proprietor only in cases where individuals do not desire to assume the responsibility.

The people are not interested in the ownership of a canal or railroad. The great object with them is to have them constructed. What is an expense of one, two, or ten millions of dollars, to the advantages of a regular, certain, speedy, and cheap intercourse? When the convenience of a whole people is advanced, how can you compute the value? Can you say what amount of benefit is derived to a particular county or town? But, above all, can you tell how much this city is to be the gainer, by the proposed improvement? In 1820, when only a few miles of the Erie Canal was completed, and one thousand dollars of tolls had been received, the population of this city was 123,000, and her taxable property 69 millions: in 1834, her population was near 260,000, and her taxable property 180 millions, thus showing that, in fourteen years, this city more than doubled the one, and trebled the other. This is not the only instance: look to your numerous cities and villages, which have sprung into existence since the termination of the last war with Great Britain; the immense appreciation of the lands and products of the country; and the thousands that have grown rich by the mere force of the prevailing causes. Buffalo, which was laid waste by the enemy during the war, has risen like a Phoenix from her ashes, and now numbers more than twelve thousand of as intelligent, independent, and enterprising a population, as ever engaged in agriculture or commerce. She was, at the gloomy period to which I refer, destitute of commerce, or means; one schooner only was left to navigate that great inland ocean. She has now a trade equal to many of our Atlantic cities: no less than 34 steamboats enter her harbor, and more than 250 schooners are engaged in her commerce. It were useless to refer to individual examples of the prosperity which pervades the regions within the influence of the Erie Canal: we have grown populous and rich beyond precedent; and it is not an extravagant estimate to say, that the internal improvements already completed in this State have added three hundred millions to the public and private resources of the country. May we not well say, that the people interest themselves little in the mere ownership of these great works? What are the eight or ten millions expended in the construction of our public improvements, to the two or three hundred millions which have been added to the general account? We may well say, then, that the people should urge the construction of railroads or canals, wherever they can be made, regardless of the amount of debt, or the hands into which the works may be placed. All that should be required is, that the general supervisory power be retained in the possession of the State. There are a number of reasons why railroads should not be owned by the State, which it is not necessary to allude to at this time, and which do not apply to canals; out the fact, that the cars and transportation of property should, to a great extent, be committed to the owners of the road, and the consequently

Recent numbers of agents and servants, is of itself to my mind conclusive.

Every work, sir, that individuals can be induced to construct, may be safely and properly committed to their hands—not only for the reasons which have been presented, but because the state has enough, and more than enough, to do, for the next coming ten years, and because it is her bounden duty to allow no time to elapse before again commencing an active career.

The first step should be the establishment of an internal improvement department, and a fund to be called the internal improvement fund,—upon which all expenses should be charged, and into which all the revenue from our public works should flow. Make this fund sacred for the objects to which it shall be devoted. Let it form a system—let it be complete in itself—let accounts be stated between the canals and the state, and settled, issuing certificates of stock (redeemable out of this fund,) having not less than twenty or thirty years to run. Then let it be declared by law that the tolls on our works of internal improvement shall not be allowed to exceed the interest and expenses on the works for the next ten years. Make your system complete, by declaring that the channels of intercourse shall never be taxed as a source of revenue beyond what may be necessary for paying the principal, interest and expenses, which may be caused by the system itself.

If this course be once adopted, the State will be enabled to construct all the canals that may be needed, and to subscribe to works in which individuals may have engaged, without any fear of imposing a tax upon the people. This will be an "Internal Improvement System," perfect in itself, looking to no other fund for a supply, and apprehending no imposition for general purposes. By establishing this system, and postponing the payment of all debts for twenty or thirty years, we shall be enabled to accomplish every object we may desire, within one-half the period which any other plan can present.

To any person conversant with the extent of country to which we are now looking for an augmentation of our trade, it will be unnecessary to say that our present canals are entirely inadequate to the increasing intercourse beyond our own State, and that we cannot be too expeditious in meeting the exigency which is approaching. We must not only increase the capacity of our canals, but we must reduce our tolls. The reduction of tolls tends to increase the amount of trade, and will continue to do so, until our canals can no longer accommodate the products which are seeking a market in our city. The debt that now binds our tolls will soon be redeemed, and we shall be left free to adopt that course in relation to the tolls that the wisdom of the State may devise.

It is not, however, necessary, and has not been, to await the extinction of this debt before incurring another: the canals, it is well known, are not sufficient for the wants of trade, and the difficulties encountered during the business seasons are beginning to be seriously felt. Last year a law was passed with a view to some improvement in the navigation of the Erie Canal—I understand, for the purpose of adding to the width of the canal, and creating double locks. I have taken some pains to inquire into this subject, and with great deference to the opinion of the commissioners, I am compelled to say that I have arrived at conclusions different from those supposed to be entertained by the State officers.

It is well known that it is now necessary to cheapen the cost of transportation, that we may enter into a more close competition with our neighbors on our northern and southern boundaries. By deepening the canals about 3 feet, and adding to the locks so as to meet the increased depth, an immense gain would be the consequence. If the canal were 3 feet deeper, the same boats that are made for our small lake trade could be loaded with twice the amount of products they now carry, and could be propelled by the same power, abating one half mile per hour in the speed—that is to say, a boat carrying double the quantity could be propelled at the rate of 9 miles the hour. The effect of this arrangement would be to enable the canal to float double the amount of goods on the same surface, in the

same time, and at about the same expense. This would be an enormous gain for a very small cost. The two things most needed are at once obtained—quantity and cost; to make our canals competent to do the business required, and reduce the cost, is of the greatest consequence. To place the two modes of improvement side by side, will easily test the question. Suppose you widen the canals fifteen feet, is it not evident that you must add to the number of boats or greatly increase their width—that the present locks would have to be altered and doubled, to meet the change in the canal,—and that no corresponding reduction can take place in the cost of transportation? Double time will be required for passing the same quantity of products, and consequently double expense and inconvenience to the State officers and the transporters. In the one case, an addition of surface to the canal, with additional locks, at great expense, without affecting the cost of transportation—in the other, a small expense, whereby the same boats, the same boatmen, and the same horses, in nearly the same time, will transport double the tonnage—the cost to the boatmen is reduced nearly one half—the expense of passing one boat, instead of two, should have the same effect on the tolls—so that we can with great propriety say, that this simple improvement, which will require very little additional water, will actually double the capacity of the canal and reduce the cost of transportation nearly one half. The great importance of this change must be evident from two prominent facts: first, that our canal is already crowded, and, second, that our neighbors afford a cheaper and more expeditious route to market. We have powerful and determined rivals for the trade which we desire to possess; and we cannot shut our eyes to the fact that they are already "going ahead" of us. Our neighbors have aroused, and are preparing to put forth all their strength. The current is already setting with some force towards the Canadian market, and it will be well for us to look in that direction for some information.

The cost of transporting a barrel of flour from Ogdensburg and Oswego, in this State, and from Prescott, on the Canada side, to Montreal, is 30 cents. To take the same from Rochester, about 40 cents; from Buffalo or Cleveland, through the Welland Canal, about 55 cents. This is the present cost; the toll on a barrel of flour from Buffalo to Albany is 33 cents, and the cost of transportation from 65 to 80 cents. The difference in this article alone is more than fifty per cent. in favor of the Montreal market. The cost on every article is of course in about the same proportion. It will be perceived, that if the tolls were entirely removed, the cost to our market would still be greater than to Montreal; it is therefore apparent, that every improvement should be made with a view to a reduction of the expense of transportation. The tolls we can change, as circumstances require, but the labor of our people must have its just reward. The expense to the Montreal market, as stated above, will not long be the standard. The Canadas are awake to their interests; already has the Government of Great Britain expended near £600,000 sterling on the Rideau Canal—and the Provinces are now engaged in improving the navigation of the St. Lawrence. They employed Judge Wright to survey the route of the river; and having ascertained that an improvement is practicable, they are preparing to make such improvements on the borders of the river as will enable them to pass vessels of the largest class to Prescott, and from thence to any of the towns on Lake Ontario. They are also about to purchase the Welland Canal, and improve it by stone locks. So that, within a few years, the navigation will be complete for a square-rigged vessel, from the Ocean to any part of either of our great inland seas. This will enable them to open the navigation with Montreal one month earlier than on the Erie Canal. It will also reduce the cost of transportation to about 25 cents from Cleveland to Montreal, on each barrel of flour; and will have the same effect upon the ascending trade. Competition is becoming formidable; and it will require an extra exertion to maintain the ascendancy of New York. We must provide means to communicate with the great route at all seasons

of the year, and with great facility; and also increase the capacity of our canals, and reduce the charge.

And now, sir, having taken this general survey, let us again turn to our own State. I would now ask, is not the course of policy we are to pursue clearly indicated by this investigation?

That a ship canal must be opened between the waters of the Hudson, and the great lakes, is so evident, that I can hardly believe a difference of opinion exists on the subject. After the survey we have made of the immense West,—of the thirty thousand miles of steamboat navigation, and the extended minor tributaries,—we have only to ask, *should not the trunk be greater than the branches?* If we wish to secure the trade of the great West,—if we wish to put our superiority beyond reach,—then, there can be no doubt, that in a commercial point of view, a ship and steamboat canal is indispensable: and as we have already by the Erie and Oswego Canals a water communication, it cannot be doubted that the object can be accomplished. Judge Wright entertains the opinion that it is practicable, and that it can be accomplished at a very moderate cost.

This latter question should have no weight in deciding this important point. The object itself is beyond price; it is too magnificent to permit a few millions to have the least influence. It cannot for a moment compare with its great utility.

Allow me, gentlemen, to direct your attention to the magnitude of the object. Consider the height to which we shall elevate the character of the State. Imagine our own city connected by a steamboat communication with our inland seas, and the thousand rivers of the mighty Mississippi. Look forward ten years, when you shall see all this,—when your wharfs shall be crowded with steamers from the ports of twenty inland States,—when your internal commerce shall have reached a point which will exceed that of all the cities of Europe,—you can then appreciate the feelings which compel me to say, look not to the cost of this great work.

Sir, this question of dollars and cents, this fear of debt, is constantly involving us in errors. It was the great obstacle to the accomplishment of the projects of the great Clinton. He, sir, found more difficulty in overcoming this than every other prejudice. But he persevered, and subdued every enemy to the prosperity of his beloved country. His mighty mind embraced the compass of the continent. He predicted the importance of the commerce of the West. His ambition was the happiness and glory of his country. And with an integrity of purpose and firmness of decision never surpassed, he was at last enabled to subdue the two greatest enemies to the prosperity of a country—ignorance and sloth.

It was he,

— "Whose comprehensive view  
The past, the present, and the future, knew."

The name of Clinton is identified with the best interests of a great country. He taught us that intelligence, enterprise, and industry, are the wealth of our nation. And that in a field so wide there can be no room for jealousy or inimical rivalry. He directed our ambition to the improvement of the minds of our youth, and the development of the resources of our country, and through him we have a practical illustration that "knowledge is power."

To accomplish the last great objects to which I have called your attention, a large amount of money will necessarily be required. It is supposed that five millions may be needed; and I am aware that notwithstanding the evidence which has been presented of the immense appreciation of the value of the taxable property in this State, that this will be the great obstacle to the attainment of our wishes. Fear of debt is sometimes prudence, and frequently commendable; but had our people acted upon the plan of owing nothing, what would have been the condition of our country? Sir, debt in a new and improving country like ours is the aliment of its prosperity. Where the people are enterprising and prosperous, interest will always be high; and where ignorance and sloth prevail, or there is no field for exertion, as in many parts of the old world, interest will be low. When a people have the rich resources of a new country to develop, then the means must be of

inestimable value. Let us incur debt, and press forward with every improvement the country is susceptible of—deferring the payment of the principal some twenty or thirty years. *It is our duty.* Defer the payment of debts until the country has become strong—until our immense forests have receded before the strong arm and enterprising spirit of our people—until the Far West shall be throwing off from her bosom the rich fruits of her prolific soil—until our city shall be the depot of the whole continent—until the trade shall have been secured to our enterprise—and until the people can afford to pay no more for the use of money, in their *private* business, than is paid by the State. Before this time shall arrive, then, an imposition of 3 cents per barrel toll on flour will pay your debt as rapidly as the present rate of 33 cents. Your trade by this course will be more than twenty times the present amount. Your facilities will be greatly increased, and the cost by transportation become almost nominal. An over anxiety to pay debt by imposing heavy tolls, in a country like ours, is the greatest curse that can befall us. Do not, therefore, gentlemen, allow yourselves to be led away by the representation that it is prudent. It is the height of imprudence. Money in our country, when expended in works of internal improvement, in many instances, is worth one hundred per cent. If any one doubts it, let him turn to the country that is traversed by our grand canal, and inquire whether property has not advanced more than two hundred per cent. in consequence of this work. Go where you will, sir, you cannot place an estimate upon the advantages which debt has, and will yield, to our country. Let us then press forward in the noble race which is before us, regardless of the cost, except so far as to prevent all useless or profuse expenditure; and depend upon the development of the resources of the country for our reward.

There is yet another point of view in which this question of a ship canal is to be considered, and which is of immense importance. It will have been observed, that the British government have it in contemplation to so perfect the navigation of the St. Lawrence, and the Welland Canal, as to admit of the passage of an armed vessel from the Ocean to the Lakes. This, it is supposed, can be done at an expense of about a million of pounds sterling. The communication between Kingston and Montreal, by the Rideau Canal and Grand river, is now completed, at an expense of near three millions of dollars.

It was intended as a medium of military intercourse, and was suggested by the difficulties which that government encountered during the war in procuring supplies from below. It is sufficiently large to pass small steamboats; and a communication of this kind is now kept up between the two cities. The proposed canal along the river St. Lawrence is now being constructed, and will afford in a few years the facilities required. It will be an immense saving to the nation. The British government will have no further use for military or armed vessels on the lakes, in times of peace. Ships can be sent from the ocean to any part of the lakes during the canal navigation; and this fact is of immense importance in a military point of view. Without any armament on the lakes, they will always be ready to defend their frontier; and with no actual cost they will always be ready for war. They will be able at any time to cover the lakes with armed vessels, and out number us at every point. It becomes our interest, as well as duty, to provide against such an emergency—not by lining our shores with fortifications, or filling the lakes with armed ships, but by following the example of our neighbor, and constructing a communication that would pass any of our armed vessels in ballast. This will be a ready and sufficient security. It will be doing no more than our citizens on the lakes have a right to demand. It may be said, that the general government ought to construct every work which is so essentially national in its character.—I answer, that the Empire State is able to take care of her own interest; and if she had no pride, still she has an interest to consult. This canal will be the grand conduit through which her commerce with the great West must pass. It is therefore proper, that she should hold the key—that the treasures, which are rightly hers, should not be under the control of another. It is

properly her own, and she would be unworthy of her character for foresight and enterprise, if she should allow any second party to participate in a work which is so worthy of herself.

And now, sir, may we not with great propriety say, *the State has enough to do*; that there is no want of objects to which to direct her attention; and that every work which individual enterprise will undertake, should be committed to their hands. Stimulate, sir, by every means that may be required, this laudable ambition of individuals. Depend upon it, too much cannot be done. Too many improvements will not be made. Dispense on all occasions the munificence of the State in such shape as will subserve to the greatest extent the interests of the people.

When all that I have pressed upon your attention is completed, we shall be on an eminence which the proudest empire on the globe might envy. And, sir, all that is now demanded of the State can be effected. This great channel of steamboat communication can be opened. The railroad of which the one under consideration is only the *beginning*, can be completed. And a ready, cheap, and certain communication will be opened *throughout the year* with the whole of our interior. The cars shall be pouring into our city in an interminable current—pressing down through its centre, and filling the stores, and warehouses, and ships with the produce of the West—infusing a life into every department of industry, and driving far from us the lethargy of our present inactive winters. Your island shall be one great warehouse for this mighty continent—and your docks and slips, from Fort Washington to the Battery, and from Whitehall to Harlem, shall be filled with the thousand steamers that will navigate the waters of the Mississippi. Your harbors shall be crowded with the ships of every nation, and this island will be the mere centre of a city which shall spring up on the shores of Long Island and New Jersey. Is all this fiction, or is it fact? Is it the offspring of an over-heated imagination, or is it only the result of a knowledge of the resources of our country? Sir, it is true. And I am glad to have the opportunity to predict, that if our State is true to her interest, all will be accomplished.

When our State shall once more be governed by the counsels of the mighty dead—when the mind of a Clinton shall be again the leading star in our councils—then will every consideration give place to the honor, the glory, and the welfare of our country—then the name of New-York shall convey the idea of superiority, and her sons shall be proud of her character, and rejoice in her prosperity. Every one should participate in the honor and glory of his country. Every true son of New-York will be alive to her every interest, and while witnessing her splendor and the triumphs of genius and enterprise, will involuntarily exclaim,

"Lives there a man with soul so dead  
That to himself hath never said,  
This is my own, my native land?"

**BLACK RIVER CANAL.**—This is a work which has been long agitated, yet notwithstanding its great importance, to restore a *just equilibrium* to the trade of the State, and to confer equal benefits upon all its citizens, very little progress has been made. The people in the Northwest section of the State, like those in the Southern counties, have contributed to those works which were designed, commenced, and completed, and which should always be considered *only* as the great *arteries*, into which the lesser channels should flow from every extreme part of the State, lying north of, and contiguous to, the main works.

We have heretofore devoted very little space to this contemplated work from a lack of information, but having, through the politeness of friends, received a report upon

the subject, we shall endeavor to make extracts from it, which may be interesting to our readers.

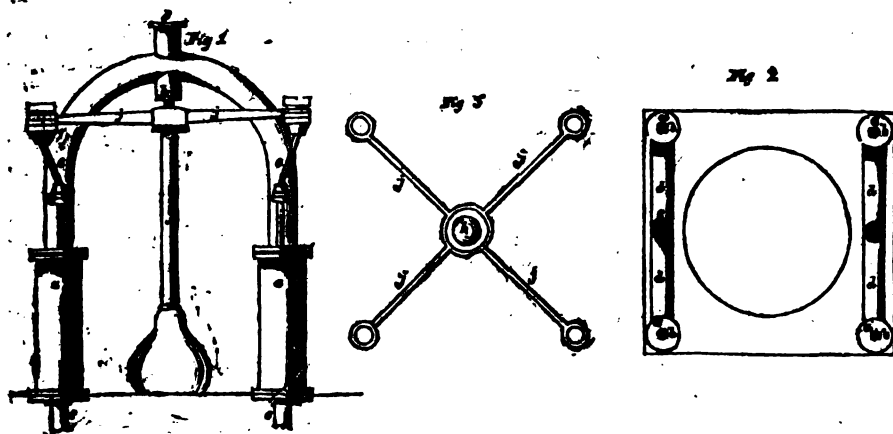

The following extract from a communication signed "CINCINNATUS," and published in the Jefferson county papers in December last, is a well-written, plain, honest statement of facts, and applies to other sections with equal truth as to the Black river section. We shall endeavor to find room for more of the communication, and should like to hear directly from its writer, for the Journal.

"Let the faith of the state be pledged for the amount necessary to be drawn, the purse strings of the capitalists unloosed, the hand and foot of the honest laborers put upon the spade; let the improvement no longer be merely talked of as 'a project,' a fruitful source of debate; let the ground be broken—the waters of two streams united for a valuable purpose; bid the forests recede—agriculture, manufactures, the arts and sciences, flourish; let us have no more of that *cold calculating policy* designed to determine *what amount the state may speculate out of our trade within a given number of years*—through the medium of tolls;—we say emphatically, do unto us as you have done unto yourselves and others, aided by means derived from the whole, and for which the faith and honor of the state stand pledged; we will then be upon an even footing, realizing advantages extended to others, but *heretofore withheld from us*, vastly increasing our means to assist in paying off our increased indebtedness. Our claims being just—the practicability of construction admitted—the consequent increased prosperity of the country in view, the credit of the state 'equal to any emergency'—where, we repeat, are to be found tenable objections to making *an immediate grant* for the work? The time has gone by when to talk about the subject will satisfy us—*effective measures* are now demanded. Do we say demanded? Yes! demanded, as well by that sense of justice, due from one portion of a community to another portion of the same community, as between man and man.

"Maintaining that it is the duty of the Legislature to divide the bounties of the state, as equally as their judgment and the rights to which they have access may enable them, the same rule applies to loans on the credit of the whole which should not be appropriated for the benefit of but a part, and deny to a remaining part the like facilities. Unnecessarily to procrastinate in its effects equal to a denial."

**Specification of the Patent granted to JOHN BARTON, of Goswell Road, in the County of Middlesex, Engineer, for Improvements in the Construction and Application of Pumps and Machinery for raising Fluids and other Purposes.**—Sealed June 1, 1833.

To all to whom these presents shall come, &c. &c.—Now know ye, that in compliance with the said proviso, I, the said John Barton, do hereby declare the nature of my invention, and the manner in which the same is to be performed and carried into effect, are fully described and ascertained in and by the following description thereof, reference being had to the drawings hereunto annexed, and to

the figures and letters marked thereon, (that is to say):

My invention consists in certain arrangements of apparatus and machinery, whereby I am enabled to take advantage of any vibration which may be produced to the body or apparatus or vessel, in which my improvements are placed, and thereby produce to the pump or pumps a constant working action; thus, for instance, in a ship or vessel, the motion caused whilst sailing or lying at anchor will at all times be producing more or less action to the pumps on board, when constructed and applied according to my improvements. And my invention consists in so suspending or connecting a weight or weights to the piston-rods of pumps, that in whatever direction an inclination may take place, such weight or weights, from their being able to act in any direction, will cause a working motion to the pumps, and it is the giving a universal power to such weights to turn to their work, in whatever direction the inclination or oscillation may take place, which constitute my present improvements. But in order that my invention may be most fully understood, I will describe the drawings hereunto annexed, which represent an arrangement or combination having four pumps, by which it will be evident that other numbers of pumps may be worked in like manner by my improvements. But I conceive that it will not be necessary for me to describe more than these arrangements, as any competent workman will from these be able to apply my improvements to other numbers of pumps. And I would observe, that my invention does not relate to the ordinary parts of pumps, the constructions of which are well known.

Fig. 1 represents an elevation; fig. 2, a plan; and fig. 3 is also a plan of the cross-arms and handles by which the four pumps are worked. By these three figures my invention is represented as applied and arranged for working four pumps; *a, a*, being four ordinary pump-barrels or cylinders; *b, b*, their piston rods; *c, c*, their induction or suction pipes; and *d, d*, their eduction-pipes, which discharge themselves into the pipes, *e, e*, from whence the water may be conveyed to any direction from the point, *f*, by connecting proper pipes thereto; *g* is a rod suspended from above

at *h*, where the rod, *g*, has a spherical ball at its end, which works within a spherical socket formed at *h*, and thus producing a universal joint, as is well understood by mechanics, by which the rod is capable of oscillating in any direction. On to this rod, *g*, is affixed the cross-arms, *j*, which arms are at right angles to each other, and work the four piston-rods, as will be evident on inspecting the three figures of the drawings, the piston-rods being connected by connecting rods, working by universal joints, in like manner to that before described. Now it will be evident, that if a weight be suspended to the rod, *g*, sufficiently heavy to work the four pistons, and the quantity of this weight will vary even for the same sized pump-barrels, depending on the perpendicular height of the lift, it will not be necessary to give any particular dimensions; all that it will be desirable to observe is, that whatever be the pressure of the water to be lifted, the weight in falling from side to side shall be sufficient to overcome the resistance.

Having now described the nature of my invention, and the manner of combining and using the same, I would have it understood that I am aware that a weighted pendulum has been already used for actuating pumps, but has only been capable of swinging or vibrating in one direction, consequently was of no use in situations where the vibration, or oscillation, is continually changing its direction; I do not, therefore, lay any claim to a weighted pendulum working in such manner, but I claim the giving a universal property to turn, in any required direction, to a weighted pendulum actuating pumps, whereby, in whatever direction the vibration or inclination may take place, the said weighted pendulum, or other similar apparatus, may be able to turn in that direction, and work the pump or pumps; for I would observe, that although I have only described an arrangement of four pumps, it will be evident that similar effects may be produced to one or more pumps.—In witness whereof, &c.

Enrolled November 30, 1833.

REVENUE OF NEW-YORK.—The amount of duties accruing from importations in this city for the year 1834, is ascertained to be TEN MILLIONS ONE HUNDRED AND EIGHTY FOUR THOUSAND DOLLARS!!!

Anchor Ice. By JACK FROST. [For the New-York Farmer and American Gardener's Magazine.]

There is perhaps no operation in nature which occurs so frequently, and yet is so little understood by people in general, as what is commonly called *anchor ice*; or the formation of ice, either adhering to the bottom, or to stones and other solid bodies below the surface of the water, and which is generally considered a prognostic of an approaching thaw.

It has been said by an ingenious writer, that "a mystery explained is a mystery destroyed," and nothing could exemplify this saying better than the wonderful mystery of anchor ice, which a very little explanation will render no mystery at all.

It is a constant law of nature, that every substance is expanded by heat and contracted by cold. And it is another law, that any substance immersed in a fluid or liquid, will float at the top or sink to the bottom, in proportion as it is specifically lighter or heavier than the medium in which it is placed. Hence, if any particles of water are colder than the rest, those particles will be condensed and become specifically heavier, and will therefore sink to the bottom. Thus, as the particles of water give off their heat to the superincumbent atmosphere, which is colder, they sink to the bottom, giving place to others, which are cooled and sink in like manner; and the particles thus cooling and sinking, receive fresh heat from the surrounding particles, which are warmer, and of course rise again, giving place to the colder ones behind them; thereby keeping up a constant action of the particles of water from top to bottom and from bottom to top, which is more or less active, according to the difference of temperature between the water and the atmosphere above it.

From these facts it is evident, that, as the coldest water will always be at the bottom, no water can ever become frozen at the surface until the whole body of water becomes cooled down to near the freezing temperature; and this explains the cause why deep waters do not freeze as soon as shallow, and why the ocean never freezes at all.\* And from the same causes, were it not for a counteracting principle, showing an equal display of infinite wisdom, water would always begin to freeze at the bottom, and we should know no ice but anchor ice.

When the water has given off that portion of caloric, which was necessary, under the atmospheric pressure, to sustain it in a liquid state—in other words, when it is cooled down near to the temperature of — Fahrenheit—the change commences, from the liquid to the solid state; in which change, as the operation of chrysalization begins to take place, the frozen particles, instead of farther condensation, begin to expand, and becoming specifically lighter, float on the surface, and this process continuing for a time,

\* Except in shallow places round the edges, and within the polar circles.

the water becomes covered with a body of ice.

Along near the middle of the temperate zone the water is seldom covered with ice more than from 12 to 18 inches thick. Below this the water still remains above freezing temperature. The ground, uncovered with water, probably, at times, and in exposed places, freezes a little deeper.

If from a pond or lake which is frozen over, the water discharges itself by a short and pretty rapid stream, into another, which is also frozen, the water in passing will not perhaps cool sufficiently to freeze in its passage; and if the stream is of considerable depth, it will protect the ground from freezing below. But where the stream is shallow, if the cold weather continues long and severe, the ground at the bottom becomes frozen, and the water passing over it freezes to it; and every stone or other substance, lying upon the bottom, becomes the nucleus to a body of ice.

In like manner, where the water is raised by a dam, and the pond frozen over, if the weather continues very cold for a long time; and especially if the dam is long, and consequently the sheet of water which passes over it very thin, and therefore not sufficient to protect the dam from frost, the dam in that case will become so cold that the water will form ice in passing over it, which adhering to the dam as a nucleus, the whole dam will become covered with ice, which will continue to increase in thickness, till the obstructed water rises and breaks away, unless it finds an outlet somewhere else.

In common streams, when the cold commences suddenly, the surface becomes frozen, before the ground at the bottom is cooled to freezing point. But when the cold becomes intense and continues long, the ground and stones at the bottom are often cooled far below freezing, and though, perhaps, already frozen at the top, freezes to the bottom and to the stones, and frequently so interrupts its own passage as to force its way over the ice above, or if the surface was not frequently frozen, the bottom will be covered with ice and the water will run over it.

With respect to its indicating a thaw, there can be no doubt but it is just as sure a token as a long spell of severe cold weather, for one can scarcely happen without the other, and as one extreme of weather generally follows another, when the weather has been very cold for as long a period as usual, it is a pretty sure sign it will not continue so much longer, and of course there will be a thaw; just as after a long season of dry weather we expect rain.

JACK FROST.

Lansingburgh, 17 Jan., 1835.

*Political Agriculture.* By H. C. [For the Quarterly Journal of Agriculture, Mechanics, and Manufactures.]

What should the Government of the United States do for Agriculture? This is an important inquiry. Agriculture is essentially the great interest of the country. The just protection of commerce, the

fostering of our manufactures, and all internal improvements, the widening and deepening of our rivers, the forming of canals the laying of railroads, and all the various facilities and forms of mutual intercourse and exchange, are indissolubly connected with the agriculture of the country, and have a favorable bearing upon its prosperity; but our particular inquiry is, what ought the Government to do to promote the art and science itself; to make its principles better known; to improve its practice; to excite and encourage a stronger emulation; and to increase those means and facilities for its advancement which are within the power of the government alone.

The British Government has been most wise in their concern and liberal in their expenditures for this object. They appointed a Board of Agriculture, at the head of which was placed that enlightened and indefatigable friend of the cause, Sir John Sinclair. Under their direction, an exact and complete survey was made of the several counties of England and Scotland, the reports of which surveys were printed at the expense of the Board. They embody an immense mass of valuable information, and contributed in an effectual manner to the improvement of the agriculture of the United Kingdom.

General Washington, himself passionately devoted to agriculture, familiar, even amidst all his various concerns, with its practical details, and aware of its importance to the country, in some letters to Sir John Sinclair, who had sent him some of these reports, perceived at once their great value, and looked forward to the establishment of a similar board among us, whose labors might be directed with equal success to the same valuable results. His letters are deserving of attention, and I here quote parts of them.

"Philadelphia, 20th July, 1794.

"I have received with peculiar pleasure and approbation the specimens of the county reports you have sent me. Such a general view of the agriculture in the several counties of Great Britain is extremely interesting, and cannot fail of being very beneficial to the agricultural concerns of your country, and those of every other wherein they are read. I am so much pleased with the plan and execution myself, as to pray you to have the goodness to direct your bookseller to continue to forward them to me, accompanied with the cost, which shall be paid to his order, or remitted as soon as the amount is made known to me. When the whole are received, I will promote as far as in me lies the reprinting of them here.

"I know of no pursuit in which more real and important service can be rendered to my country, than by improving its agriculture, its breed of useful animals, and other branches of a husbandman's care; nor can I conceive any place more conducive to this end than the one you have introduced for bringing to view the actual state of them in all parts of the kingdom; by which good and bad habits are exhibited in a manner too plain to be misconceived; for the accounts given to the British Board

of Agriculture appear in general to be drawn up in a masterly manner, so as fully to answer the expectations formed in the excellent plan which produced them,—affording, at the same time, a fund of information, useful in political economy, and serviceable in all countries."

A second letter is dated Philadelphia, 10th July, 1795: "I could not omit so favorable an opportunity as the departure of Mr. Strickland affords me, of presenting my best respects to you, and my sincere thanks for the views of agriculture, in the different counties, which you have had the goodness to send me, and for the diploma (received by the hands of Mr. Jay,) admitting me a foreign honorary member of the Board of Agriculture. For this testimony of the attention of that body, and for the honor it has conferred on me, I have a high sense; in communicating to the Board, I shall rely more on your goodness, than on any expression of mine to render it acceptable.

"From the first intimation you were pleased to give me of this institution, I conceived the most favorable ideas of its utility; and the more I have seen and reflected on the plan since, the more convinced I am of its importance, in a national point of view, not only to your own country, but to all others which are not too much attached to old and bad habits to forsake them; and to new countries that are just beginning to form systems for the improvement of their husbandry."

A third letter to the same gentleman is dated Philadelphia, 10th December, 1797: "The result of the experiments entrusted to the care of Dr. Fordyce must be as curious as they may prove interesting to the science of husbandry. Not less so will be an intelligent solution of those inquiries relative to live stock, which are handed to the public."

"A few months more, say the third of March next, and the scenes of my political life will close, and leave me in the shades of retirement; when, if a few years are allowed me to enjoy it (many I cannot expect, being upon the verge of sixty-five,) and health is continued to me, I shall peruse with pleasure and edification, the fruits of the exertions of the Board for the Improvement of Agriculture; and shall have leisure, I trust, to realize some of the useful discoveries which have been made in the science of husbandry.

"Until the above period shall have arrived, and particularly during the present session of Congress, which commenced the 5th inst., I can give but little attention to matters out of the line of my immediate avocations. I did not, however, omit the occasion at the opening of the session, to call the attention of that body to the importance of agriculture. What will be the result, I know not at present, but if it should be favorable, the hints, which you will have it in your power to give, cannot fail of being gratefully received by the members who may constitute the Board."

I regret that I have not at this time access to the speech to which he refers in this letter; but it is understood that he

proposed to Congress the establishment of a Board of Agriculture similar to that which existed in Great Britain. Such were the views of this great man, this true patriot, of the importance of the great interest of agriculture to the United States; and of means within the immediate power of the Government, by which they could most essentially subserve its advancement and prosperity. It is certain it has not received that direct attention and patronage to which it is entitled; and though the Government has done something for the protection of the wool grower, and for the cultivation of silk and sugar, by the publication and distribution of valuable treatises on these two important subjects, yet very little has been, nothing compared with what might be, may I not add, ought to be done, both for these and other important interests of agriculture. The establishment of a Board of Agriculture like the English Board, composed of a few of our most enlightened, enterprising, and patriotic farmers, or planters, whether in Congress or out of it, who would give their attention to obtain a thorough agricultural survey of the whole country, would be of the highest benefit. This is a matter of such universal advantage, and in which no party views could mingle, unless they were forced in by violence, I can but indulge the hope that if it were distinctly presented and urged upon Congress by a respectable array of names, in different parts of the country, it would be favorably considered. But if the plan should be thought too extensive to be feasible by the government of the United States, it ought to be urged upon the different States. Let the Empire State, the magnificent republic of New-York, take the lead in this as in other splendid essays of improvement. Massachusetts, never behind in any good work for the general welfare, and Pennsylvania, now almost breathless in her public enterprises, will no doubt follow in her train; and, in due time, a mass of agricultural intelligence would be obtained, and at a comparatively trifling expense, which would, in its beneficial influence upon the States who should undertake such a thorough agricultural survey of their own territories, be more than an equivalent for a hundred times its cost.

With a view of communicating my own ideas more fully, and of drawing the attention of others to the subject, I hope it will not be thought presuming too much if I subjoin such a form of memorial as I should be glad to see presented to the Congress of the United States at a future session, with the names of many of our distinguished and influential fellow-citizens attached to it; and if it should fail of success there, or there should be so little hope of success as to discourage and prevent the application, such an one as might properly be presented to the Legislatures of several of our States, hoping that at least there the obvious advantages of such a survey might, from being nearer, be more fully seen, and the project be received with favor. I am very far from presuming that this is the best way of accomplishing the particular object,—that is, a thorough agri-

cultural survey of the country; and entertain no exclusive partiality for my own views; but this is a mode which has occurred to me, and with all due respect I leave it to the wise, intelligent, and patriotic, among the friends of agriculture, to suggest a better.

(To be continued.)

*Miscellaneous Collection of Facts and Opinions.* By S. F. [For the New-York Farmer and American Gardener's Magazine.]

**BUTTER.**—There are three requisites in producing an easy separation of cream—the milk should have a large surface, be kept perfectly still, and at the temperature of 54 to 56 degrees. If desirous of obtaining all the cream, the milk should not be skimmed as soon as it curdles. The best butter, however, is made from the cream that rises first. If the room containing the milk is too warm in the hot season, the floor should be often washed, and salt occasionally sprinkled over it. The sooner the cream is churned the better will be the butter, and the less the latter is washed with water, the more delicate and pleasant will be its flavor. In the fall and winter, Mr. W. Allen, of North Andover, obtains butter by churning ten minutes. He raises his cream to 72 or 73 degrees.

**CUT STAW FOR HORSES.**—At this season of the year, horses that are used much, or that perspire freely, are apt to take cold, and become hide-bound. They require once or twice a couple of table spoonfuls of sulphur mixed with their food, which should be of cut straw, and corn and cob, and oats, ground together. If well curried, their skins will soon be loose, and they will begin to thrive immediately.

**HAY ON BARN FLOORS.**—When hay, particularly clover, is thrown on the floor, much of it, and the most valuable part, too, breaks and crumbles into so small pieces, that the fork will not take them up. In most barns, this is entirely wasted or shoved out into the yard, where but comparatively little of it is picked up by the stock. "I," says an aged farmer, "keep my barn floor as clean as my wife's parlor, and every day shovel into an old sleigh or box, which I keep standing by, all the leaves, seeds, and fine parts of the hay. This makes superior feed for my cows: if moistened with water, and a small quantity of bran or meal added, and given about the time of calving, nothing appears more nourishing to them.

**MORUS MULTICAULIS.**—Seeds of this plant have been sown in this country, in the vicinity of Northumberland, Mass., I think. Perhaps some reader of the New-York Farmer will state the result in reference to this plant being a mere variety. It is the opinion of the French Royal Society of Agriculture that it is not a distinct species—that its seed will not produce its like—that it cannot be preserved except by propagating it by layers, cuttings and grafts—and that it is exclusively by these means that the Chinese have reared this plant from time immemorial.

**STONE WALL FOR SHEEP.**—A farm well fenced with stone is much more valuable

than one with rails, even if suitable timber grows on the farm. There is, however, one drawback. One unruly sheep will take a flock over a whole farm, and soon learn them to skip over the best of wall fences, with so much ease that it is impossible to keep them, except where they are disposed to remain. Some farmers have been obliged to abandon sheep husbandry on this account. If the stone wall is high, and well faced, and the pasture good, sheep may often be kept without much inconvenience or damage. Ordinary stone fences, with a top rail, will not prevent unruly sheep from scaling them. They will approach the fence in an oblique direction, and skip over it with the ease of a deer. If the top rail is made to project over towards the field in which the sheep are, it answers a much better purpose. The best top rail is red cedar, with all the limbs left on to the length of two feet. If two fields are fenced in this manner a farmer need not be troubled with unruly sheep. Alternating them in these lots will ever afford good pasture, and enrich the ground.

*Swine.* By H. C. [For the New-York Farmer and American Gardener's Magazine.]

**MR. EDITOR:** To inquisitive minds facts are always instructive and valuable. "What man has done, man can do." This is a lesson of the highest practical utility. The experiments of others excite competition, and their success encourages and animates our exertions. For these reasons I propose to give you, from my agricultural minutes, a few accounts of the success of some individuals in fattening swine. I shall not refer to any examples of hogs which have been kept to an advanced age, and on account of their extraordinary size have been carried through the country for exhibition. Some of these have been of an enormous size. But I propose to give you the weight of some which have been fattened for consumption, and their weight, when dressed for the market. I shall put down, where they are ascertained, the place and year where and when they have been raised, their owners' names, their age, and weight.

- 1815—Eli Couley, Deerfield, Mass., killed eight. They were all of one litter, and were 19 months old. Their weight as subjoined—577, 492, 540, 423, 492, 445, 405, 455—total.....3809 lbs.
- 1823—P. Denton, Greenfield, N. Y.  
four pigs, 9 months 17 days, wt. 348, 318, 310, 308—total.....1284 "
- 1824—Oliver Chickering, Shrewsbury, Mass.  
one, 19 months.....650 "  
G. Wheelock, do.  
one, 30 months.....584 "
- 1825—Maskell Ware, Rhodestown, N. J.  
one.....740 "  
—Johnston, Bridgton, N. J.  
two, 19 months.....1100 "
- 1828—Enoch James, Deerfield, N. H.  
one, 18 months.....716 "  
—Smith, Hunterdon, N. J.  
five hogs, the oldest 12 months, four less than 11 months; largest, 329 lbs.; smallest, 265; weight of the whole..1501 "
- 1829—Stacy Hall, Portsmouth, N. H.  
one, 22 months.....682 "  
This hog gained 500 lbs. in less than a year. He was of the Byfield breed.
- 1830—Alanson Sessions, Cumberland, R. I.  
one.....675 "  
one.....645 "  
Richd. Leisura, Swansey, R. I.  
one, 30 months.....712 "
- 1831—John King, Medford, Mass.  
one, 30 months.....726 "

Samuel Dare, Salem county, N. J.	954 lbs.
one, .....	Weight alive, 1074 lbs.
D. Rowell, Madison,	
six hogs, wt. 427, 436, 449, 483, 492,	
538—total.....	2835 "
Capt. Mackay, Weston,	
two hogs, 30 months—wt.....	1218 "
Farmer in Dunning street, N. Y.	
twenty-nine hogs, average wt. each	400 "
1832—Karl Stimson, Galway, N. Y.	
twenty hogs, average wt. each....	414 "
1823—Asa Littlefield, Framingham, Mass.	
one, 18 to 19 months.....	678 "
1834—In Nantucket, Mass.	
one.....	470 "
Increase in 267 days, 295 lbs.	
Sable Rogers, Springfield, Mass.	
one, 9 years old.....	708 "
E. Thayer, Charlemon, Mass.	
one, 17 months.....	542 "
Pittston, Benesaeler county, N. Y.	
two, 15 months.....	893 "
Lansingburgh, N. Y.	
one, 14 months.....	412 1/2 "
R. Benedict, Lagrange, Dutchess co., N. Y.	
sixteen hogs, average each.....	333 "
S. B. Clapp, Lagrange,	
one, 10 months.....	340 "
Called the Mocho breed; probably	
some local designation.	
Andrew Lake, Sharon, Dutchess co., N. Y.	
twenty-one hogs, average wt.....	351 "
Doty, Hempstead, L. I.	
Two hogs, 14 months old, one.....	611 "
".....	578 "
The above were fed upon apples and	
milk through the last of the summer;	
in the fall, upon Indian meal,	
how prepared is not known.	
De Wolfe, Deerfield, Mass.	
two hogs, one.....	433 "
".....	483 "
1835—Eben. Burrill, Jr., Lynn, Mass.	
Three hogs, age not ascertained, but	
believed not to exceed 19 months:	
one.....	492 "
".....	610 "
".....	743 "
Total.....	1845 "
Solomon Williams, Deerfield, Mass.	
one.....	482 "
".....	528 "
Total.....	1010 "

Such results as the above are certainly remarkable and encouraging. Much, undoubtedly, of such success is owing to the particular breed of hogs; not a little to the management and mode of feeding. In no branch of husbandry has there been greater and more acknowledged improvement than in the race of swine, within indeed the memory of most of us. This improvement, in the judgment of one of the most distinguished butchers and packers of pork in Boston, has added hundreds of thousands of dollars to Massachusetts. The origin of the Byfield breed I perfectly well remember. A respectable friend of mine, living in Byfield, one of the parishes in Newbury, Mass., being at market one day in Newburyport, found a small Chinese boar pig, recently arrived in a vessel from India or Canton; which he obtained and carried home in his pannier or market cart; for it was then common to carry meat to market in two large square baskets, hung on either side of the saddle, where the farmer rode. From this animal he propagated the stock with success, which has spread through the whole country, and even to Europe, under the same name. This could not have been far from the year 1790, and this good man and excellent farmer is still living.

Since that time various crosses have been made, and other valuable breeds introduced into the country. Without question, the finest boar in appearance which I have ever seen is owned by David Hosack, Esq., M. D., at his magnificent establishment at Hyde Park on the Hudson; whose superlatively fine stock of Improved Durham Cows, not surpassed, and, when the number is considered, not equalled by any, which have come under my observation, and whose admirable flock of pure Dishley bucks and ewes, reflect the highest honor upon his public spirit, and his truly patriotic liberality. Mr. Caleb N. Bement, of Albany, the keeper of an excellent hotel in Market street, a spirited and intelligent farmer, as well as a courteous and attentive landlord, has, through the kindness of Dr. Hosack, a boar from his stock, which promises extremely well. He has likewise a cow from the improved stock of I. Whitaker, of England, of most extraordinary excellence in appearance and product; and much other stock, deserving the attention and examination of every admirer of fine animals.

Meadowbanks, Jan. 7, 1835.

*Tanner's Bark and Leaf Mould for Strawberries.* By D. F. A. [For the New-York Farmer and American Gardener's Magazine.]

MR. FLEET: In the last number of the Farmer I notice a communication by H. H., on the use of tanner's bark in the cultivation of the strawberry. I tried it some years since, and though a very good thing, it has some disadvantages: First, it is generally found to impart a disagreeable flavor to the fruit; secondly, it cannot be procured at all times, and then but in few places, unless at too much expense. I have this year tried a substitute, which I recommend in preference, as every wood or copice will furnish the material.

Rake away all the loose leaves from a corner or hollow, where they annually settle, and gather the coarse mould beneath; or prefer the decayed wood from an old stump or fallen tree, that has decomposed, until it has become nearly in appearance like tanner's bark. It is without that astringent quality, and will answer in all respects, prevent weeds, preserve moisture, warmth in winter, food in spring, and by selecting the wood from different trees, a variety of tints may be formed that will make a pleasing appearance when this chilly season deprives us of so much of our garden foliage. I subjoin my method of cultivating. In the fall, cover the beds slightly with straw, and burn all down; then dig in between the hills with a trowel or deep hoe, rake smooth, and replace with a fresh dressing two inches thick, for winter protection, &c. The hills ought to be no more than twelve inches apart, and two or three stems in a hill. While the fruit is setting, water morning and evening, with a table spoonful of salt to each pail of rain or river water; if well wa-

tered, it should be exposed to the sun some days. A bed planted from any good variety in full bearing will, thus treated, always insure a crop. Early in September is the best time to plant, choosing the first made runner plants, or some offsets for immediate bearing. The runners will come in the second and third season.

D. F. A.

December, 1834.

**SUPPLYING THE CITY WITH WATER.**—In the board of Aldermen last evening, the Report of the Commissioners for supplying the city with water, was read and accepted. "The plan" says the Times "is to obtain water from the Croton river—the grand reservoir for the city to be the summit of Murray Hill, about three miles out, and which is higher than the highest house in the city. The cost of bringing water to Murray Hill, is calculated to be \$4,250,000, and from thence through the city \$1,262,000 more, making in all \$5,512,000. The pipes already down will answer for a part, and their cost may be taken from the above amount. It was stated that in 110 fires last year the loss of property which was insured amounted to \$910,931, and that there was about half as much more not covered by insurance. The loss by fire in the city of New York averages \$1,000,000 a year, one fifth of the cost of the projected water works, most of which would be saved by a ready and abundant supply of water."

We trust the Board of Assistants will, at their next meeting, concur with the Aldermen, and that, at the Spring Election, there will be a clear vote in favor of this useful, this magnificent, and only certain, project.

#### 23d CONGRESS—Second Session. LIST OF ACTS

*Passed at the second session of the 23d Congress.*

An act to render permanent the present mode of supplying the Army of the United States, and fixing the salary of certain clerks therein named.

An act for the relief of Samuel Bragdon, David Chase, and the owners of the schooner Halcyon.

An act for the relief of Charles Gordon, and the crew of the schooner Two Sons.

An act for the relief of Wm. P. Zantzinger, Purser in the Navy of the United States.

An act for the relief of Silas D. Fisher.

An act for the relief of Mervin P. Mix.

An act for the relief of Humphrey B. Gwathmey.

An act for the relief of Robert Haile.

An act for the relief of Evan Edwards.

An act for the relief of Samuel S. Lord, and the owners and crew of the fishing schooner Mary and Sally, of York, in the State of Maine.

An act for the relief of Frances Lassell and others, Michigan volunteers.

An act for the relief of Samuel Butler.

An act for the relief of Job Barton.

An act for the relief of David Kincaid.

An act for the relief of Stevens Smith, and the heirs of Patrick McRowan and crew of the fishing schooner Rising States, of Bath Bay, in the State of Maine.

An act for the relief of Mathew C. Perry, a Master Commandant in the Navy of the United States.

An act for the relief of E. R. Shubrick, of the United States Navy.

An act for the relief of Riddle, Beetle, and Headington.

An act for the relief of John J. Avery.

An act for the relief of Stephen Gatlin.

An act for the relief of Theodore Owens.

An act for the relief of the representatives of Thomas Clemmons.

An act for the relief of Shubael Conant.

An act for the relief the legal representatives of Aaron Smith.  
 An act for the relief of Thomas Ball.  
 An act for the final adjustment of the claims to land in the southeastern district of Louisiana.  
 An act for the relief of Wm. Haskell and others.  
 An act for the relief of John Collins, a soldier of the Revolutionary war.  
 An act for the final adjustment of claims to lands in the State of Louisiana.  
 An act granting a pension to Amasa A. Tift.  
 An act to regulate the pay of the Navy of the United States.  
 An act granting a pension to Isaac Janvier.  
 An act for the relief of Peter Triplett.  
 An act authorizing the Secretary of the Treasury to refund to Richard Butman the tonnage duty imposed on the schooner Brandywine.  
 An act granting a pension to Wm. Wilges.  
 An act for the relief of Simeon Meacham, of the State of New York.  
 An act for the relief of the children of Dominick Lynch.  
 An act granting a pension to Joseph Mead.  
 An act granting a pension to Benjamin Leslie.  
 An act for the relief of James Young.  
 An act for the relief of Henry Arkward.  
 An act granting pensions to William Baden and James Harrington.  
 An act for the relief of John Ashton.  
 An act granting a pension to John Gerodello.  
 An act granting a pension to Samuel Sheldermine.  
 An act for the relief of Joseph Gilbert.  
 An act for the relief of the legal representatives of John Muldowney.  
 An act granting a pension to Thomas Morton.  
 An act for the relief of Timothy Jordan.  
 An act for the relief of the heirs and legal representatives of Bailey E. Clarke.  
 An act to authorize the Secretary of State to issue letters patent to James Jones.  
 An act for the relief of Joseph Swartwood.  
 An act for the relief of Abraham E. Boutwell and David Pearson.  
 An act for the relief of Daniel Page.  
 An act to allow further time to complete the issuing and locating of military land warrants during the late war.  
 An act for the relief of Thomas Buford.  
 An act to make appropriations for the payment of the Revolutionary and other pensioners of the United States, for the year one thousand eight hundred and thirty-five.  
 An act to extend the time of issuing military and land warrants to the officers and soldiers of the Revolutionary army.  
 An act making appropriations for the support of the army for the year one thousand eight hundred and thirty-five.  
 An act making appropriations for the current expenses of the Indian Department, for the year one thousand eight hundred and thirty-five.  
 An act for the relief of John Moore.  
 An act making appropriations for the naval service for the year one thousand eight hundred and thirty-five.  
 An act making appropriations for Indian annuities and other similar objects for the year one thousand eight hundred and thirty-five.  
 An act to amend an act, entitled "an act authorizing the construction of a bridge across the Potomac, and repealing all acts in relation thereto."  
 An act for the relief of George C. Seaton.  
 An act granting a pension to John Bryant.  
 An act granting a pension to Larnard Stallow.  
 An act for the relief of Richard T. Archer.  
 An act to change the place of holding the District Court of the United States of the District of Mississippi.  
 An act for the relief of John Tice, assignee of William Pennington.  
 An act granting a pension to Noah Miller, an invalid major of the militia.  
 An act making appropriations for certain roads, and for examinations and surveys, for the year one thousand eight hundred and thirty-five.  
 An act placing Captain Cole, a Seneca Indian Chief, on the pension roll.  
 An act making additional appropriations for the

Delaware breakwater, and for certain harbors, and removing obstructions in and at the mouths of certain rivers, for the year one thousand eight hundred and thirty-five.  
 An act for the relief of William O'Neale and Robert Morrison.  
 An act for the relief of Benjamin Holland.  
 An act authorizing the construction of a Dry Dock for the Naval service.  
 An act making appropriations for building light boats, beacons, and monuments, and placing buoys for the year eighteen hundred and thirty-five, and for other purposes.  
 An act to authorize the City Council of St. Augustine to widen a street in St. Augustine.  
 An act to authorize letters patent to be issued to Francis B. Ogden.  
 An act making appropriations for the Civil and Diplomatic expenses of Government for the year one thousand eight hundred and thirty-five, and for other purposes.  
 An act amendatory of the act for the continuation of the Cumberland Road.  
 An act to authorize the removal of the Land Office at Wapahongkonea to Lima, in the State of Ohio.  
 An act to prescribe the punishment of Consuls, Commercial Agents, and others, in certain cases.  
 An act to authorize the sale of certain lands belonging to the University of Michigan.  
 An act for improving the harbor at the mouth of the river Raisin, in the Territory of Michigan.  
 An act granting to the borough of Michilimackinac certain grounds for public purposes.  
 An act for the completion of certain improvements in Florida.  
 An act for the relief of Col. J. Eugene Leitensdorfer.  
 An act for the relief of the legal representatives of Moses Shepherd, deceased.  
 An act for the relief of John Dougherty, an Indian Agent.  
 An act for the relief of Lemuel Tanner, assignee of Pierre Dufresne.  
 An act making an appropriation for the completion of the Military Barracks at New Orleans.  
 An act to provide for the further compensation of the Marshal of the District of Delaware.  
 An act to authorize the construction of a railroad upon the public lands from Tallahassee to St. Marks, in Florida.  
 An act supplementary to an act entitled an act to authorize the inhabitants of the State of Louisiana to enter the back lands.  
 An act to continue the office of Commissioner of Pensions.  
 An act for the continuation and repair of the Cumberland Road, in the States of Ohio, Indiana, and Illinois.  
 An act to complete certain roads of the Territory of Arkansas.  
 An act in amendment of the acts for the punishment of offences against the United States.  
 An act to establish branches of the Mint of the United States.  
 An act to authorize the Secretary of the Treasury to compromise the claims allowed by the commissioners under the Treaty with the King of the Two Sicilies, concluded Oct. 14, 1832.  
 An act further to suspend the operation of certain provisions of "an act to alter and amend the several acts imposing duties on imports," approved July 14, 1832.  
 An act further to extend the time allowed for the execution of the duties of the commission for carrying into effect the convention with France.  
 An act granting a pension to Justus Cobb.  
 An act granting a pension to Isaac Eckright.  
 An act granting a pension to Solomon Case.  
 An act to change the time of holding the District Court of the United States, for the Western District of Virginia, held at Clarksburg.  
 An act supplementary to an act entitled "an act to authorize the extension, construction and use of a lateral branch of the Baltimore and Ohio Railroad, into and within the District of Columbia."  
 An act to provide for paying certain pensioners at Jackson, in the State of Tennessee.  
 An act to extend the patent of Robert Eastman, for a further period of seven years.  
 Joint Resolution, giving the right of way thro'

the property of the United States at Harper's Ferry, to the Winchester and Potomac Railroad Company.  
 Resolution for the (sale) of a Lion and two Horses, received as a present by the Consul of the United States at Tangier, from the Emperor of Morocco.  
 Resolution presenting a gold medal to Gen. Croghan, and a sword to each of the officers under his command, for their gallantry and good conduct in the defense of Fort Stephenson in 1813.  
 The President has recognized Nicholas D. C. Moller, as Consul of the Republic of Venezuela, for the city of New York.  
 MASSACHUSETTS—GOVERNOR DAVIS transmitted a message to both Houses of the Legislature, resigning the office of Governor and accepting that of Senator in Congress. Lieutenant Governor Armstrong, by the Constitution, is empowered to perform all the duties and exercise all the prerogatives of Governor, for the remainder of the year, and until a Governor shall have been chosen and qualified in his stead.  
 The Arabian horses, lately sent as a present from the Emperor of Morocco to the President of the United States, were sold at auction, at Washington, on Monday, in pursuance of a resolution of Congress. One was bought by Mr. Flournoy of Virginia, for 1205 dollars; and the other, by Messrs. Horton and Tammany, of Pennsylvania, for 860 dollars.  
 The Boston Transcript of Monday evening says "The *Frigate Constitution* got under way this morning at half past 11, and was towed out of the harbor by the steamboat *Banger*."  
 †Extract from the *Garde National*.  
 MARSEILLES, Dec. 19, 1834.  
 General statement of commerce, of France, 1833.  
 The second result offered by the administration of the custom-house, in its *Tableau General*, is that of the whole of our relations with each of the great commercial Powers of the world.  
 The United States continue to be placed very far ahead of the nations with which we hold the most extensive trade. In 1833 our importations amounted to 99,079,212 francs, and our exportations to 117,396,336 francs. After the United States, the following is the order of the Powers with which our relations are the most extensive:  

	Imports.	Exports.
England, comprising Malta, Gibraltar, and the Ionian Islands...	39,741,639	116,195,250
Belgium.....	68,244,632	52,348,152
Spain, including the Canary Islands 41,844,505	62,491,580	62,491,580
Sardinia, island and continent....	68,737,000	49,687,122
Austria, including the Lombard Venetian Kingdom.....	48,213,779	6,657,401
Switzerland.....	31,168,603	58,191,450
Germany.....	24,567,138	41,945,779
Russia.....	23,103,800	10,553,791
Prussia.....	20,491,212	7,401,000
India.....	37,406,138	5,205,112
Turkey, including the islands of the Archipelago.....	17,264,911	14,412,779

 § The following statements are taken from the official tables for the financial years, ending the 30th September of each year.  

Imports from France.				
Years.	Total.	Silks.	Wine.	Brandy.
1834	8,191,000	2,340,000	200,000	580,000
1835	11,636,000	5,632,000	419,000	884,000
1836	9,590,000	4,191,000	639,000	450,000
1837	9,449,000	4,981,000	565,000	694,000
1838	10,393,000	2,962,000	436,000	1,024,000
1839	9,617,000	4,263,000	444,000	644,000
1830	8,241,000	3,519,000	445,000	910,000
1831	14,724,000	6,848,000	651,000	2,840,000
1832	12,755,000	5,044,000	902,000	616,000
1833	13,963,000	6,256,000	930,000	860,000

Exports to France.				
Years.	Total.	Cotton.	Value.	Am ton. cleared.
1834	10,552,000	40,696,000	6,436,000	104,900
1835	11,881,000	30,012,000	5,916,000	100,500
1836	12,106,000	62,943,000	6,178,000	131,500
1837	13,545,000	70,423,000	7,350,000	147,700
1838	12,008,000	53,490,000	5,903,000	120,900
1839	12,532,000	47,464,000	6,835,000	157,700
1830	11,800,000	75,105,000	7,646,000	148,700
1831	9,857,000	46,157,000	4,984,000	98,800
1832	13,945,000	77,477,000	7,723,000	129,500
1833	14,423,000	76,833,000	8,045,000	110,800

**Novel, Practicable, and Cheap Mode of obtaining Good Crops of Wheat.** By O. P. Q. To the Editor of the New-York Farmer.

MR. EDITOR.—In the Complete Farmer and Rural Economist, recently published in Boston, a work of great merit, the following directions are given for the cultivation of wheat on the authority of John Townsend, of Andover, Conn. We make only a short extract: After a crop of corn, "plough three inches deep, and spread on evenly four or five inches of well rotted manure, and sow three pecks of good clean wheat to the acre, and unless something disastrous happen, the summer following your garner may be filled with the finest wheat."

Now, we ask, very respectfully, of the "editor of the Complete Farmer," to whose authority we have been long disposed to defer, to inform us who is the happy farmer, saving always Mr. Jno. Townsend, of Connecticut, who has mature enough, and time enough to put it on, to spread evenly four or five inches of well rotted manure over his wheat fields? and to let us know whether "any thing disastrous" has happened to Mr Townsend since he adopted this very pleasant and feasible operation? This is book-farming with a witness. O. P. Q.

**STONES ON TILLABLE GROUND.**—It is the practice of most farmers to pick the stones off their fields after they are laid down to grass the spring prior to mowing. Is it not better to carry them off when putting in the seed, and prior to the last harrowing. By thus doing, grain and grass will grow in the places occupied by the stones; and these are often very considerable portions of the surface. At this time there is no difficulty in getting up the stones. Last fall, I sowed five acres of stony ground with wheat and rye, and picked off all the stones after the seed was sown, and before the harrowing was finished. The appearance of the field was very much improved.

**PLASTER OF PARIS.**—At the distance of fifteen miles from the city, on the banks of the Hudson, gypsum answers a very good purpose on clover; and yet salt water ascends near a hundred and fifty miles above this. On Long Island, it is supposed not to succeed on account of the proximity of salt water.

**CLOVER WITH OATS.**—Many of the farmers in West Chester and Putnam counties sow clover seed with their oats—think it takes better than with rye or wheat. The ordinary rotation in most parts of this section of the Union is corn, oats, rye, or wheat with clover. In order to secure the enriching properties of clover, I should suppose, even in this rotation, it would be profitable to sow clover with a view of turning it under for rye or wheat in the fall. The expense of seed and sowing is but a trifle. The pasture, from the time the oats are cut to that for fall ploughing, will pay for all expenses.

**STOCKINGS.**—Those made of common wool are said to be more durable than from Merino wool.

**TOWNSEND & DUFFEE**, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of **Duffee, May & Co.** offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. Co. Albany; or to James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania.

Hudson, Columbia county, New-York, {  
January 29, 1833. }

#### RAILROAD CASTINGS.

**MANY & WARD**, Proprietors of the Albany Eagle Air Furnace and Machine Shop, will make to order car wheels, chairs and knees, and every other description of castings required for railroads. R-ly feb14

#### PATENT HAMMERED SHIP, BOAT, AND RAILROAD SPIKES.

Railroad Spikes of every description required, made at the Albany Spike Factory. Spikes made at the above Factory are recommended to the public as superior to any thing of the kind now in use. Ship and Boat Spikes made full size under the head, so as not to admit water. Orders may be addressed to Messrs. **ERASTUS CORNING & CO.**, Albany, or to **THOMAS TURNER**, at the Factory, Troy, N. Y. sept. 13-ly

#### PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to. **HENRY BURDEN**, Agent.

Troy, N. Y. July, 1831.

Spikes are kept for sale, at factory prices, by I. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. I. Brower, 223 Water street, New-York; A. M. Jones, Philadelphia; T. Janvier, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes.

#### MILL DAM FOUNDRY FOR SALE.

The Proprietors of the Mill Dam Foundry offer for sale or lease their well known establishment, situated one mile from Boston. The improvements consist of:

No. 1. *Boiler House*, 50 feet by 30 feet, containing all the necessary machinery for making boilers for Locomotives and other steam Engines.

No. 2. *Blacksmith's Shop*, 50 feet by 30, fitted with cranes for heavy work.

No. 3. *Locomotive House*, 54 feet by 25, used for putting together Locomotive Engines. Several of the best Engines in use in the United States have been put in this establishment.

No. 4. A three story brick building, covered with slate, 190 feet by 44, containing two water-wheels, equal to 40 horse power; Machine Shop, fitted with lathe, &c.; Pattern Shop; Rolling Mill and Furnaces, capable of rolling 4 tons of iron per diem, exclusive of other work; three Trip Hammers, one of which is very large; Engine for blowing Cupola Furnaces, moved by water-wheel; one very superior 24 horse Steam Engine, which could be dispensed with; and a variety of other machinery.

No. 5. An Iron Foundry, 80 feet by 45, with a superior air Furnace and two Cupolas, Core oven, Cranes, &c. fitted for the largest work. Attached to the Foundry is a large ware-house, containing Patterns for the Castings of Hydraulic Presses, Locomotive and other Steam Engines, Lead Mill Rolls, Gearing, Shafts, Stoves, Grates, &c. &c. These were made of the most durable materials, under the direction of a very scientific and practical Engineer, and are supposed to be of great value.

No. 6. A building, 65 feet by 36, containing a large stack of chimneys, and furnaces, for making Cast Steel. This building is at present used as a boarding-house, and can accommodate a large number of men.

No. 7. A range of buildings, 300 feet long by 36, containing counting room, several store rooms, a Brass Foundry, room for cleaning castings, a large loft for storing patterns, stable for two horses, &c. &c.

The above establishment being on tide water, presents greater advantages for some kinds of business than any other in the United States. Coal and Iron can be carried from vessels in the harbors of Boston, to the wharf in front of the Factory, at 25 to 30 cents per ton. Some of the largest jobs of Iron work have been completed at this establishment; among others, the great chain and lift pumps for freeing the Dry Dock at the Navy Yard Charleston.

The situation for Railroad work is excellent, being in the angle formed by the crossing of the Providence and Worcester Railroads. The Locomotive "Yankee," now running on the latter road, and the "Jonathan," purchased by the State of Pennsylvania, were built at these works. With the Patterns and Machinery now in the premises, 12 Locomotives and as many tenders, besides a great quantity of cars and waggon, could be made per annum.

For terms, apply to **THOS. J. ECKLEY**, Treasr., &c., Boston, or to **ROBERT KALESTON, Jr.**, Philadelphia. Boston, Dec. 20, 1834.

#### STEPHENSON.

Builder of a superior style of Passenger Cars for Railroads.

No. 264 Elizabeth street, near Bleecker street, New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad now in operation. Jss 14

#### RAILROAD CAR WHEELS AND BOXES, AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, 82 66 Wall street, New-York, will be promptly attended to.

Also, CAR SPRINGS. Also, Flange Tires turned complete. J8 **ROGERS, KETCHUM & GROSVENOR.**

#### RAILWAY IRON.

25 tons of 1	inch by 1	inch,	Flat Bars in lengths of
200	do.	1 1/2	14 to 15 feet, counter sunk
40	do.	1 1/2	holes, end cut at an angle
800	do.	1 1/2	of 45 degrees, with
800	do.	2	splicing plates and nails to
800	do.	2 1/2	suit.

3250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Flims of 20, 22, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Arches of 24, 28, 32, 34, and 36 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment. A. & G. RALSTON, 9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them. 67lineovr

#### SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by

E. & G. W. BLUNT, 164 Water street, corner of Maiden lane. J31 6c

#### SURVEYING AND ENGINEERING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principle of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new, among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also a Railroad Goniometer, with two Telescopes—and a Leveling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG, Mathematical Instrument Maker, No. 9 Dock st., Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested. Baltimore, 1833.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad, I cheerfully furnish thee the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sight, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend, **JAMES F. STABLE**, Supt of Construction of Baltimore and Ohio Railroad. Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer. Germantown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

**HENRY B. CAMPBELL**, Eng. Philad. Germant. and Norrist. Railroad

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, MARCH 14, 1835.

**MARYLAND, AS CONTRASTED WITH NEW-YORK, ENTERPRISE.**—The House of Delegates of Maryland have authorized a loan of two millions of dollars for the purpose of completing the Chesapeake and Ohio Canal to Cumberland. This is truly an evidence of liberality. This canal terminates in another territory—yet the State of Maryland, with a spirit of true and judicious munificence, or liberality to its Western citizens, who are to be benefitted by the work, lends her credit to insure its completion—as she also has for the completion of the Susquehanna Railroad, by the loan of a million, for the benefit of the City of Baltimore.

Will the great State of New-York imitate her example?

**ONTARIO AND HUDSON SHIP CANAL.**—We have commenced in this number the Report of Mr. E. F. JOHNSON, upon that part of the canal between Utica and Oswego. It was our intention to have given it entire, but its length has prevented. We shall, however, give in the next number his very appropriate and correct remarks upon the importance of the work. They exhibit

the enlarged views of a liberal mind—and should be read by every man who doubts the importance and necessity of the work.

The annexed extracts from Mr. Johnson's remarks will show the advantages to be derived from a ship canal navigation.

From Lake Erie to the Hudson River, the distance by the Ontario route is 378 miles, and exceeds that by the Erie Canal only 15 miles. Of this distance, 146 miles is along the Niagara River and through Lake Ontario; about 62 miles more of improved navigation along the Oswego and Oneida Rivers and Oneida Lake, leaving only 140 miles from the latter point to the Hudson at Albany.

The increase in lockage by the Ontario route is 240 feet, which being overcome by 30 locks, will occasion a delay of four hours; making the liberal allowance of eight minutes for the passage of a single lock. To compensate for this delay, we have the greater celerity of motion on the Ontario route, which may be rated as follows:

Buffalo to Lewiston, 30 miles, 3 1-3 miles pr. hour, 9 hours.
Lewiston to Oswego, 146 " " " " " 16 "
Oswego to Albany, 202 " 5 1-2 " " 37 "
Total, 378 miles in 64 hours.

By the Erie Canal the distance is 363 miles, which, at 2 1/2 miles per hour, the average speed for freight boats, gives 145 hours; making a difference in favor of the Ontario route of 83 hours, or reducing the time more than one half.

My estimate of the probable relative cost of transportation, is deduced, in part, from a printed tariff of rates established by companies engaged in that business, for the year 1834, and since the reduction of the tolls.

From this tariff, the charge per mile, per 1,000 lbs., for heavy goods, conveyed as described, is as follows:

	Miles.	
New York to Albany, 7.3	Steam on the Hudson River.	
Albany to Buffalo, 29.6	By the Erie Canal.	
Buffalo to Detroit, 11.3	By vessels. } to 15th Oct.	
Buffalo to Chicago, 18.7	" " " " " } " " "	
Oswego to Niagara, 6.9	By schooners to 30th Sept.	
Oswego to Toronto, 14.5	To 15th October.	

The preceding exhibits a great difference in favor of navigation by wind and steam upon the larger waters, when compared with a canal.

On the Hudson River the cost is only one third of that upon the canal for the same distance.

On Lake Erie, from Buffalo to Detroit, it is one half by sail vessels and three fourths by steamboats. On Lake Ontario it is two thirds, and from Buffalo to Chicago but little more than one fourth.

The reason for a higher charge upon Lake Ontario than Lake Erie, is undoubtedly in a great measure owing to the less amount of business upon the former, a difference which will not exist when Lake Ontario shall become a more general medium of transportation.

From Lake Erie to the Hudson River, on the Ontario route, one third of the whole distance is lake navigation. It will not, I apprehend, be unreasonable to infer from the facts presented above, that the cost of transportation will, in consequence, be materially reduced.

At the close of of the Report given in this number of the Journal, is a transposition. The table of aggregate sections should come before the general remarks, and the few paragraphs in the head of general remarks belong to that part of the Report not published.

We have received the following letter in relation to the reported new channel, or entrance to the Suwanee River, from an officer of the Army:

TALLAHASSEE, Florida, Feb. 26, 1835.

SIR,—I perceive that you have inserted in the Railroad Journal an article first published in the Floridian of this place, giving an account of a pretended new discovery of a channel into the Suwanee River—which discovery, if true, would be of considerable importance, not only to the country on the river, but to the Atlantic seaport cities, as well as those of the Gulf of Mexico, as a route of communication, by means of the Suwanee and St. John's Rivers, between them.

The report of the discovery originated with Mr. Watson, a gentleman of high respectability and intelligence, who resided near the spot—who has assured me, on inquiry of him, that an entire misapprehension of his meaning has been taken by the author of the article in question. His only discovery was the harbor at the mouth of the river, which is the same surveyed by Capt. Swift, of the U. S. Topographical Engineers, some years since, and where Col. Gadsden found the vessel at anchor belonging to Arbuthnot & Ambriester, when St. Marks was taken by Gen. Jackson, as he has described to me in person.

I give you this information, that you may save many from being misled, who may feel an interest in this quarter.

*Report of E. F. Johnson, Esq., in relation to a Ship and Steamboat Canal from Utica to Oswego.*

The city of Utica, the point where my examination commenced, is situated in the upper, or western part of the Mohawk valley, in a region of country fertile and healthy, and already considerably advanced in agriculture and manufactures. In a commercial view, it occupies a prominent position on the line of the great thoroughfare from the Hudson to the Lakes, and is the first point of divergence of the trade in its course west, being situated near the western entrance to the deep valley of the Mohawk. The Erie canal passes longitudinally through it, and it is the point of termination of two important works of internal improvement, both of which are in a course of construction, viz.: the Chenango Canal and the Utica and Schenectady Railroad; the former connecting the Erie Canal with the valley of the Susquehanna, and the latter uniting with the Mohawk and Hudson Railway, and forming therewith a railway communication to the Hudson River at Albany. The Mohawk River, which bounds the city on the north, is 30 feet below the Erie Canal, and 390 above tide water. It has its source in the elevated country at the north and west, its head waters interlocking with those of Fish Creek and Black River. Thence it runs southerly to the village of Rome, from which place it pursues an easterly course to its junction with the Hudson River, nine miles above Albany.

From Rome to Utica, 15 miles, the descent by the river is 30 feet, the most of which occurs in the first 8 miles. The intervening valley is composed of an alluvial bottom, varying from one half to one mile in breadth, and bordered on each side by the slopes of the elevated ridges which form the confines of the valley. The channel of the river between the points mentioned, is exceedingly serpentine. In breadth it varies from one hundred to two hundred feet, and in depth from 2 to 10 or 12 feet. The banks and land, on either side, are low; from 7 to 8 feet only above low water, and during the spring floods are completely submerged in many places to the depth of four or five feet. The Mohawk, in the distance mentioned, receives several important tributaries, viz.: the Six and Nine Mile creeks on the north, and the Little Oneida, Oriskany, and Saquoit creeks on the south; the two latter of which afford numerous and valuable hydraulic privileges, many of which are improved.

The village of Rome occupies the height of land between Lake Ontario on the west, and the Atlantic on the east, and is the lowest summit, with the exception of the Champlain, between the great St. Lawrence basin, and the Atlantic Ocean. The ground on which the village stands is about 25 or 30 feet above the Mohawk River. Towards the south it is lower, and swampy. On the margin of the lower ground skirting the village, is the site of the "Old Rome Canal," constructed some 30 years since, by the Western Inland Lock Navigation Company, and forming at the time, in connexion with the Mohawk River, the waters of Wood Creek, Lake Oneida and the Oswego River, the only navigable communication between the Atlantic and the west. The village of Rome is likewise the point of termination of the proposed Black River Canal, a project which has been some time in contemplation, and which has been viewed as consti-

tuting an important feature in the system of inland navigation in the State.

Proceeding from Rome west, the country assumes a different aspect. We now enter the broad valley of that beautiful series of inland lakes, which are distributed through the interior of the State, viz.: Oneida, Onondaga, Skaneateles, Owasco, Cayuga, Seneca, Crooked, and Canandaigua.

These lakes are the recipients of the drainage of an extensive and fertile region, the waters of which are conveyed by the Seneca and Oneida Rivers to a point of junction forty-six miles west of Rome, and from thence constituting the Oswego River; which, after running northwesterly a distance of 23½ miles, empties into Lake Ontario at the village of Oswego.

The northern portion of this valley, from Rome to the Oswego River, is somewhat elevated. The ridge which bounds it, is nearly parallel with Lake Ontario, declining in elevation towards the Oswego River, but possessing, it is believed, no point of depression less elevated than the Rome summit, if we except, perhaps, a short distance in the immediate vicinity of the Oswego River.

At the foot of this northern slope is the Oneida Lake, 21 miles in length, with a medium breadth of five miles. This lake lies in a direction nearly east and west. It receives, as tributaries, Fish Creek, with several smaller streams on the north and east, and Oneida and Chitteningo Creeks on the south. The valley in the latter direction, although much diversified in its surface, is broader and more open, and more advanced in cultivation than the country north.

It is along this slope, parallel with, and elevated about 60 feet above the lake, that the Erie Canal is located. From a point 9½ miles east of Utica, the canal is one continued level westward to Syracuse, a distance of 69½ miles. At Utica it passes through the centre of the city, 30 feet above the Mohawk River. At Rome, it occupies the low ground already described, half a mile south of the village. Between Utica and Rome it passes through the flourishing villages of Yorkville, Whitesborough, and Oriskany, crossing the Saquoit and Oriskany Creeks by two aqueducts. At Rome, it receives, by two feeders, the waters of the Mohawk River, together with those of Little Oneida and Wood Creeks. From Rome, west, to the termination of the level, it receives a supply from nearly all the streams which flow from the south, with the exception of the Oneida Creek, arrangements for the admission of which have already been made by a provision in the charter of the Oneida Lake Canal Company, who are now engaged in opening a communication between the Erie Canal and the Oneida Lake, at its eastern extremity.

The direct course from Rome to the Oneida Lake, leads along Wood Creek. The distance is 14 miles. This creek unites with Fish Creek, a large and powerful stream, a short distance before it enters the lake. The channel of Wood Creek is very crooked. The navigation of the upper part of it was formerly improved for small boats, by means of dams and locks. For the remaining distance, the curvature was so great as to render it, notwithstanding the great descent, a comparatively sluggish stream.

For six miles adjoining the lake, and extending to some distance on either side, the ground is low and swampy, not exceeding five or six feet above the waters of

the creek, and subject at times to be overflowed.

From the junction of the two streams to the lake, and, indeed, for some distance up the main or Fish Creek, the depth varies from 14 to 25 feet. At the mouth of the creek is a broad bar, extending out for some distance, having a minimum depth of water of 2½ feet. The water is likewise shoal along the east end of the lake. The remainder of the lake has sufficient depth for navigation. The level of this lake varies at different seasons; the maximum difference observed in the spring is 6 or 7 feet; the average from four to five feet. The level of low water is subject to less variation than that of high water. Five years since, the State directed the surface to be reduced, by the removal of obstructions in the outlet, for the purpose of reclaiming the low lands contiguous to its eastern and western margins.

From the south side of the lake to the Erie Canal, the distance is from 5 to 6 miles. About midway of this distance are the Cawassalon and Canaseraga branches of the Chitteningo Creek, running parallel with the lake for some distance. These streams are bordered by an extensive marsh, elevated, it is stated, from 17 to 24 feet above the lake, and separated from it by a tract of hard land.

The outlet of the lake is by a stream of large size, having an average breadth of from 300 to 350 feet, and, with the exception of ten or twelve places, exceeding 10 feet in depth, in its lowest state.

This outlet is termed the Oneida River. Its length is 19½ miles, and its descent 9½ feet, to where it unites with the Seneca and Oswego Rivers. The land on either side is, with few exceptions, elevated above the reach of flood waters, and has an undulating surface. The stream pursues a very circuitous course, the direct distance between its two extremes being only 8 miles: From Three River Point, the place of junction with the Seneca and Oswego Rivers, to Lake Ontario at Oswego, the distance is 23½ miles, and descent 112 feet.

The Oswego River is very broad, not less, on an average, than 600 feet, and discharges a large quantity of water; being the drainage of nearly 4,000 square miles of country. It is likewise very equable in its flow. The extremes of flood and drought not causing a greater difference than from 4 to 5 feet, and by the ordinary rains is seldom swollen to a greater height than from 12 to 20 inches. This is owing to the numerous lakes from whence it draws its waters, and which, in connexion with its magnitude, renders it eminently fit for navigation by the aid of dams and locks.

An improvement of this kind has already been effected, and adapted to boats of the size of those navigating the Erie Canal, and uniting with that work at Syracuse near the west end of the Rome level. The number of dams is eight, which are passed by means of short canals and locks constructed on the eastern side of the river; the number of the latter being 14, and overcoming 109 feet of descent, the balance to 112 being made up in the inclination of the surface of the river. The most of this descent occurs in the 12 miles nearest the lake.

From Three River Point to Oswego Falls, 12 miles, the place where the greatest descent begins, the banks are not high, varying from 12 to 10 feet. There is but little low land in the immediate vicinity of the river; on one of its tributaries, however, from the west, Ox Creek, the land is low.

for some extent, and is said to be injured by the setting back of the waters from the dam below.

At Oswego Falls is situated the village of Fulton, possessing great advantages in the amount of its hydraulic power. From thence to the lake the banks of the river are uniformly high and steep, in some places rock bound, unbroken by any ravines, and presenting an unvarying sameness of appearance. The river for this distance passes over a rocky, and in some places gravelly bed of red and gray sandstone.

At its confluence with Lake Ontario is situated the flourishing village of Oswego, occupying the ground on both sides of the river, possessing many commercial and manufacturing facilities, the latter of which are improved to a considerable extent.

The harbor, which covers an area of about 40 acres, is protected by a pier erected by the General Government. The place is favorably situated for concentrating the trade of the lake, and constitutes (it is believed) the best termination for the proposed canal.

#### Size and Character of the proposed Canal.

In the absence of definite instructions on this subject, I have assumed for the dimensions of the proposed canal, a depth of 8 feet; breadth at surface, 90 feet. Inside slope of banks, 2 horizontal to 1 perpendicular. The banks to be well faced with stone; the canal to be provided with a towing path; the locks to be 30 by 150 feet in the clear in the chamber, with a lift of about 8 feet; and, together with the culverts, to be built of stone, in the most substantial manner. The aqueducts, waste-weirs, and bridges to be constructed with substantial stone abutments; the latter to be formed with draws, for the convenience of passing vessels.

A depth of 8 feet has been adopted, as being suited to the draught of such vessels as can navigate the great lakes with safety; that being the depth of water in the Welland Canal, and likewise the depth to which the Delaware and Raritan Canal has ultimately been increased; both of which canals are designed for vessels navigating the larger waters. The locks are assumed double the width of those now used in the New-York canals, to enable boats from those canals to pass them by pairs. This width is but little, if any, greater than would be required for vessels of suitable proportions for lake service, drawing 7 feet water; and it was therefore deemed the most proper dimension to adopt.

The tonnage of vessels adapted to a canal of the above dimensions, may be rated nearly as follows:

	Register.
Schooners.....	150 tons.
Freight vessels to be towed by steamers.....	190 "
Steamboats.....	140 "

Provision for the protection of the banks has been made in the estimate, to guard them from the effects of abrasion by the wave or swell caused by boats moving rapidly, whether propelled by steam or otherwise, and a towing path constructed to allow the use of animal power. Bridges for the accommodation of farms are not contemplated, from a conviction that they will be incompatible with the character of the navigation.

The dimensions assumed for the canal are, it is believed, sufficiently moderate. I am strongly impressed with the idea, that a larger channel would be preferable, corresponding in size to the improvements on the St. Lawrence, and to the proposed en-

largement of the Welland Canal. Whether this magnitude can be obtained at a reasonable expense, will depend, perhaps, in some measure, upon the character of that portion of the route between Utica and Albany, not included in the present examination. A canal of the largest size practicable will, I am convinced, be the best.

The present avenue of communication from the Hudson to Lake Erie has been in full and successful operation only 9 years, and is now hardly sufficient for the necessities of trade. It would be evident impolicy in the proposed undertaking, to limit the view so much as to render a revision and enlargement necessary at the expiration of another ten or fifteen years.

[We omit, at this time, the particular description of the route, giving merely the points and distances.]

#### Total Distance from Utica to Oswego.

	Mls. chs.
Utica to Fort Ball (Erie Canal enlarged).....	16.43
Fort Ball to Oneida Lake.....	10.94

Total.....	56.76

Total..... 92.49

Making a total of 35 miles and 53 chains of canal navigation, and 56 miles and 76 chains of lake and river navigation.

#### General Remarks.

I have thus far confined myself to an examination of the practicability and probable expense of that portion of the proposed steamboat canal, lying between Utica and Oswego.

I have thought it not improper, in continuation of the subject, to advert to some of the more prominent of the relations which a work of that magnitude, connecting the great lakes with the tide waters of the Atlantic, will bear to the internal commerce of the country.

That there is no other route presenting the same or equal facilities for an enlarged navigation, by which the trade of the west may be conveyed in the most direct manner to the sea-board, will, I believe, be readily conceded by every one acquainted with the physical geography of the country. The only important question, therefore, which remains to be decided, is, whether the time has arrived for forming such a communication. The evidence of this must be deduced principally from an examination of the existing and prospective

increase in trade of that region of country, the surplus produce of which will naturally find its way to market along the great thoroughfares from the Lakes to the Hudson.

The following table exhibits the past, with the prospective increase in population of the States and Territories mentioned, deduced from the census taken at the periods stated from 1800 to 1830.

Superintendence & contingencies, 10 pr. ct.			109,908
Whole cost of the canal,			\$1,191,989

To the preceding amount of \$1,191,989, must be added whatever expense it may be found necessary to incur for obtaining the requisite supply of water, as likewise the damage, should it be necessary to allow any, for injury to the business prospects of the Oneida Lake Canal.

[From the Journal of the Franklin Institute.]

Specification of a Patent for an Improvement in the Mode of Chilling Cast Iron Wheels for Railroad Cars. Granted to PHINEAS DAVIS, Civil Engineer, city of Baltimore, July 29, 1834.

Whereas, it has been found that, in the casting of what are called chilled wheels, for railroad cars, that the part of the wheel which is most liable to wear, namely, the rise, cone, or curve, between the tread of the wheel and the flanch, is usually less hard than the other parts, for the obvious reason that the metal is there less rapidly cooled by the chill.

Those acquainted with the business of, casting iron, are aware that the operation of chilling consists in placing within the mould, so as to make a part thereof, a piece, or pieces of iron, which, when the metal is poured in, rapidly cools that por-

tion with which it is in contact, and renders it hard. In the casting of wheels for railroad cars, the chill consists of an iron hoop, of considerable thickness, and with which the whole face of the wheel, including its flanch and tread, is in contact; but from its form, as I have already indicated, there is one part of it, uniting the tread with the flanch, which is less rapidly cooled than the others. To remove this difficulty, I employ what may be denominated an internal chill; this consists of an iron hoop, or ring, which I usually form of round rods, half an inch in diameter, giving to the hoop, or ring, such a diameter as shall cause it, when laid in the flask, and the casting made, to be surrounded by, and completely imbedded within, the cast metal, and to stand about half an inch within the body of that part of the wheel which forms the curve, or cone, before spoken of, and opposite the centre thereof. But as, in the usual thickness of the rims of such wheels, the said ring would be covered on the inside by only a thin shell of metal, I form such a bead, projection, or thickening, opposite thereto, on the inside of the pattern of the wheel, as will cause the metal to cover it, about three-eighths of an inch.

Iron-founders are well acquainted with the means of supporting such articles as the before described ring, within the flask, so that they may be embraced within the cast metal. The method which I have adopted of effecting this in my wheels, is the following. I take four strips of iron, which may be one-tenth of an inch thick, one-fourth of an inch broad, and four or five inches long, and one end of each of these I bend round the ring, so as to clasp it tightly, the remainder of the strap forming a shank, or bearing, which rests upon the sand in the lower flask. These clasps stand at equal distances apart, and, when in the mould, point toward the centre of the wheel. The pattern must be so made, that the parting of the sand in the flask will be opposite to the centre of the ring. Facing sand, of the usual description, should be used in making the mould. The ring, before being placed in the mould, should have its surface made bright, by filing, or otherwise. It must also be heated, say to the temperature of boiling water, to dissipate any moisture, or other evaporable matter, which might otherwise cause it to blow. The casting should be performed immediately after placing the ring in the flask.

Although I have described the mode of procedure in casting, and in other parts of the process for forming wheels within which are imbedded a ring of wrought iron, I do not claim these as making any part of my invention; but I do claim the using of a hoop, or ring, of wrought iron, to be laid and cast within the body of a railroad wheel, in such manner as to operate as an internal chill, to cool more rapidly, and consequently to harden, the part which I have described under the name of the curve, or cone thereof; I claim no more. PHINEAS DAVIS.

[From the same.]

*Specification of a Patent for Promoting the Combustion of Anthracite in Locomotive and other Steam Engines.* Granted to PHINEAS DAVIS, Civil Engineer, city of Baltimore, July 29, 1834.

The means by which I promote the combustion of anthracite, or other fuel, is by the employment of fan wheels, or vanes, revolving within drums, in a manner well known to machinists; and my improvement consists in the arrangement of the apparatus by which I employ the waste, or escape steam, to give motion to such fans, or vanes. For a locomotive engine, I usually employ two fan wheels, and I have found them, and their appendages, to answer well in practice, when made of the dimensions which I am about to indicate, although, in this particular, there may be considerable variation, without injury to the effect. The wheels may be from eighteen to twenty inches in diameter, and from ten to twelve inches wide; they may be placed upon the same axis, and at the distance of about eighteen inches from each other in the clear; in many instances, two vanes to each wheel will be sufficient, but a greater number may be used; the drums within which the wheels revolve do not differ from those ordinarily employed in similar blowing machines. The wind is conducted from these drums through tubes seven or eight inches square, which lead from them in the direction of a tangent to the circle described by the wheels, into a tight ash-pit under the grate of the furnace; and the air is thereby forced through the fuel with such velocity as to cause the fire to burn with great energy, so as to produce an abundant supply of steam from anthracite, notwithstanding the tendency of that fuel to pack, and thereby to impede the ordinary draft, when employed for locomotive engines.

In order to give motion to the fan wheels, I place a steam wheel upon the same shaft with them, generally at the centre thereof, so as to be equidistant from them. This steam wheel is constructed in the same manner, nearly, as the wind wheels, differing from them principally in its dimensions, and its being acted upon and impelled by an elastic fluid, (steam,) whilst they act upon and impel an elastic fluid, (air.) The steam wheel has usually four wings, or vanes, from three to five inches in width; and it may be from twenty to twenty-four inches in diameter. This wheel is enclosed within a drum, of such dimensions as just to allow the vanes to revolve freely within it. A tube connected with the exhaust pipe, from each end of the cylinder, enters the drums tangentially, and the waste steam is thus injected forcibly against the extreme ends of the vanes, impelling them, and consequently the wind wheels, with great velocity. The steam which thus enters escapes at an opening, or openings, in the centre of the drum, made similar to those at which the air enters from the action of, and to supply the, fan wheels.

As it is necessary to command the blast, so as to regulate the intensity of

the fire, which would often be too great were the whole of the waste steam discharged upon the steam wheel, I attach a branch pipe to that which conducts the steam from the cylinder, or cylinders, to the steam wheel, and employ a valve, or valves, so arranged as to enable me to direct the whole, or any desired portion, of the steam, through such branch pipe, and thus attain the desired object in the most perfect manner.

The continued fresh supply of steam, and the diminished centrifugal force of that which has acted upon the vanes, continues, however, to operate until the moment of its escape at the opening surrounding the centre, provided the parts are properly proportioned to each other, for although its energy is diminished, so also is the actual velocity of the vane, as the centre is approached.

The opening in the steam wheel, for the escape of steam, I usually make on one side only, and cover this with a cap, or drum, and from this cap, or drum, a tube extends upwards to carry off the steam in such a way that no inconvenience may be experienced by its discharge.

Although I intend always to use the waste steam from the cylinder, or cylinders, it is manifest that steam may be supplied from the boiler, to act upon the steam wheel; but this procedure would not be economical, and would yet be a manifest invasion of my rights.

I am aware that wind wheels, such as I have described, have been used to supply a blast to the furnaces of locomotive engines; I am also aware that wheels have been propelled by the action of steam upon wings, or vanes, surrounding them; I do not, therefore, claim either of these, singly and separately, as my invention; but what I do claim is the combination and arrangement of the parts such as I have described, by which the waste, or escape steam, is made to act upon vanes revolving within a drum, for the purpose of giving motion to wind wheels, to feed the furnaces of steam engines.

And I do hereby declare, that I have herein explained and set forth what I believe to be the best method of applying the waste steam to accomplish the proposed object, but that I do not intend thereby to confine myself to this precise mode of construction and arrangement, but to vary the same as I may find convenient, whilst I operate upon the same principle, and attain a like end by analogous means.

PHINEAS DAVIS.

We insert the following communication with pleasure, and should be pleased to hear often from its author.—[ED. R. R. J.]

*Remarks relative to the Steam Engine.*

To the Editor of the Railroad Journal:

SIR,—If you consider the following remarks relative to the steam engine worthy of attention, oblige me by giving them a place in your Journal.

In all machines it is a desideratum, that just such an amount of power should

be applied as is necessary to produce the desired effect. When the effect to be produced requires different degrees of power at different times, the machine should be so arranged as to be able to exert more power at one time than at another; and it should at no time exert a power greater than is necessary to produce the effect required at that time. The want of thus apportioning the power and effect is obvious in many cases where steam is used, particularly so when it is used as the motive power on rail and other roads; and a great waste of power is the consequence.

In cases where locomotive steam engines are used on railroads, which are undulating, or various in their grades, it is common to give them such loads as they are capable of moving up the steepest ascents which they are expected to encounter between their places of starting and destination. If they are expected to pass ascents of 24 feet to the mile, they only take half the load which they are capable of moving on a level, and if they have to pass descents of that inclination, as well as ascents, they have nothing to do while they are thus descending. When stationary steam engines are used to draw boats or cars up inclined planes, they are generally idle during a considerable portion of their time, yet the steam must be kept at its full pressure, so as to be ready for any work which may offer.

In order to prevent this waste of steam when used as the *primary power*, it is proposed to employ the engine during its moments of ease and leisure, in condensing atmospheric air, which condensed air will be used as a *secondary or reserved power*, and be applied to assisting the engine when it has the most to do.

The atmospheric air to be condensed in air chambers of *globular, cylindrical, oval, rectangular*, or other shape, as may be found best suited to the case, and to be made of copper, iron, or other suitable material.

The air to be passed from the air chamber, through *hot tubes*, to one or more working pistons, similar to the pistons of a high pressure steam engine; the tubes to be kept at as high a temperature as is found expedient, so that the air may enter the cylinder of the working piston rarified as much as possible, whilst the air in the chambers will be kept at a low temperature by surrounding them with a non-conductor of heat. Although the use of the hot tubes will greatly tend to economise the use of air, it may not be found expedient to use them in all cases.

In cases where *globular air chambers* are used, they may be provided with *air measures*, so that, although the air in the chamber may have a pressure greatly exceeding that necessary for producing the desired effect on the working piston, yet such a quantity only shall be let out at one time as is necessary to produce that effect. This may be done by having something like a safety-valve to the measure, so adjusted as to shut off the sup-

ply of air from the chamber at the moment it raises.

In cases where the air chambers have a shape other than globular, they may be provided with a *piston* so arranged as to decrease the size of the chamber as the air is used; that is, for each cubic foot of air used by the working piston, the air chamber shall be reduced in size one cubic foot, by which means the full pressure of air will be kept up, until it is all exhausted. These pistons may have a vertical or a horizontal motion, and may be forced into the chamber by *levers and weights, cords passing round drums, or cog wheels working in racks*.

After the air has produced the desired effect on the working piston, it is proposed to pass it into the fire of the engine, so as to hasten the combustion of its fuel.

When locomotive engines have not weight enough to produce the necessary adhesion, it is proposed to connect the wheels of the engine with those of its tender, and, if necessary, with those of several of the loaded cars following next after it. The forward and after wheels of the engine and cars may be connected by *cranks and connection rods*; and the wheels of one car with those of another, by *chains*, with suitable *links*, passing round *cog wheels* fixed on the middle of the axles. The chains may be made to work tight on the cog wheels by *pressure wheels*, to be so arranged as to cause the two sides of the chain, that is, the sides of the chain above and below the cog-wheel, to approach each other, and to operate only when necessary.

An engine having the two kinds of power thus combined, it will be proper to entitle the *Pneumatic Steam Engine*, and the advantages which must result from the combination are obvious.

The capacity of the ordinary locomotive steam engine used on railroads, must be greatly increased by it; in some cases it may be doubled. Even when it is used on level roads, it is often difficult to keep up the pressure of steam. By having condensed air on hand, the deficiency of power on account of the low pressure of steam will not only be supplied, but the combustion of the fuel hastened, and consequently steam generated more rapidly, at the very time when it is most wanted.

By combining the secondary and primary power, in steam engines at the head of inclined planes, the steam engine need only have a power equal to the whole amount of work to be done, instead of a power equal to the elevation of the heaviest load, which may be offered at any one time.

The great difficulty in the way of using steam carriages on common roads,—viz., too much weight for their power,—will be measurably removed by the combination.

The combination may be used for the purposes of regulation and economy, in all cases where the steam engine is called on to exert a greater force at one time than at another, and where the intervals of time, during which the greater force has to be exerted, are too long for the ad-

vantageous use of the *fly-wheel*; and it may be used with advantage as a regulator of hydraulic as well as steam power.

In submitting the above remarks to the public, I am fully aware of the danger which surrounds me, in common with other inventors: that of being blinded by my partiality to the products of my own mind. Perhaps I have already fallen into the snare; certain it is, that if there are any insurmountable difficulties in the way of making the combination, I cannot see them; but I wish to get at the truth, and therefore invite criticism.

Respectfully,

J. D. STEELE, Jr.

Ellicott's Mills, Md., Feb. 15, 1835.

We have been favored with the following statement, taken from the Journal du Commerce of 29th January last, relative to the Railroads in France. We give it as another evidence of the increased favor with which Railroads are viewed.

[From the New-York American.]

IMPORTANT TO BALTIMORE and to NEW YORK.

—The House of Delegates of Maryland have passed a bill authorising a loan of *two millions* of dollars, to the Chesapeake and Ohio Canal Company, which will suffice to complete that canal to Cumberland; and a loan of *one million* of dollars, to the Baltimore and Susquehanna Railroad, which will complete that road to York, in Pennsylvania. The Senate, it was confidently believed, would concur.

The Mayor of Baltimore had in consequence, and in conformity with an application from many most respectable citizens, convened a town meeting for this day, to express their gratification at this event, and to take immediate means to make it available.

Will not these efforts, and those scarcely less strenuous making in Pennsylvania, arouse our State—and this city and the south-western counties in particular—to the necessity, the pressing, urgent necessity—if they mean to maintain their fair proportion of the late Fall, and early Spring, trade, with the great West—of at once entering upon the construction of the *New York and Erie Railroad*? There is no other path but that, through which New York can secure to herself the benefits which natural advantages, and the present course of trade, put within her reach.

Let her not from mistaken views of economy—or from doubts unworthy of, and unauthorised by, her own experience—lose the golden opportunity.

[From the "Mechanics" Magazine and Register of Inventions and Improvements.]

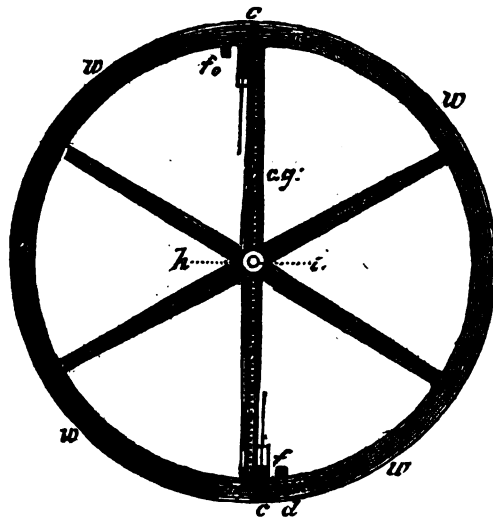

We are indebted to the politeness of Dr. Bartlett, editor of the Albion, for the following drawing and description of a Rotary, or "Gravitating Rotary Engine." It is singular in its construction, although not new to us in the application of the steam through the main shaft and arms. The hollow rim and "gravitating" part of the machine are to us entirely new.

#### Elliott's Gravitating Rotary Engine.

A new and highly important discovery has recently been made in the application of steam to a very simple machine, by combining those two powerful agents, *steam* and *gravity*, together, and called a *Gravitating Rotary Steam Engine*, for generating a steady rotatory motion by the pressure of steam exerted between a gravitating weight and a *closed and alternating valve*,\* and capable of communicating a direct rotatory motion, as a *first mover* to all kinds of machinery, by means of a single wheel on a shaft, requiring neither crank or piston, or but very few of the incumbrances of the common steam engines now in use.

The above is the invention of an Englishman, Mr. James Elliott, a native of Rothbury, Northumberland, Eng., a practical mechanic, who has been employed in the construction of a great variety of mills, and other machinery, in the Province of New-Brunswick, and has occupied the most of his leisure time for the last eleven years in its completion.† We have procured a drawing of this gravitating rotatory steam engine, and from the following brief description, with which we have been furnished, we presume that any scientific person may form a pretty correct idea of its plan, simplicity, and capabilities. As to its application as a *first mover*, we may safely assert that it is unequalled.

The principal part of this gravitating rotatory steam engine consists of a strong cast iron wheel, of any given diameter, having a hollow rim, with three, four, or more arms in it, some of which are also hollow, for conveying steam. A part of the space in the hollow rim of this wheel is very nicely fitted inside with a piece of solid cast iron, or other heavy metal, forming the *gravitating weight* intended to fix the maximum of the desired power, which weight slides *freely* all round this rim, or more properly the rim round it, and is made steam tight at or near its ends, either with packing in the common way, or with mercury. The steam is made to enter the wheel at its centre, by a moving steam-tight collar, fitted on the wheel shaft close to the

wheel, and passes by a valve into one of the hollow or *working arms*, which conducts the steam to the rim while that arm is at the lower circumference,\* when the valve at the extremity of the arm shuts, and brings the pressure of the steam in contact with the gravitating weight in the hollow rim, where, acting with its expansive force against the end of the weight, and pressing against the closed valve, a separation of these parts takes place, the rotatory motion is generated, and the wheel is moved round by this joint resistance (the weight remaining suspended at the pressure) until that arm is carried round to the top, when the valve attached to it opens and lets the weight slide quite clear of it; whilst the valve in the opposite arm being at the bottom in its turn, now shuts through and cuts off a small body of the steam at its pressure, and resists the flowing steam as the first one had done before, at the same instant opening the exit valve immediately behind it; the valves attached to the working arms thus alternating with great mechanical regularity, let the speed be ever so great, being instantly and simultaneously *shut* when at the bottom, and *open* when at the top of the circumference.

A rotatory engine of 100 horse power, of this descriptive principle, would not weigh more than 1½ or 2 tons—need not be over 10 feet diameter—or the hollow rim not more than from 10 to 18 inches wide; for although the longest leverage is at all times the most desirable, yet the difficulty of construction is somewhat increased by so doing. For steamboats, this rotatory engine is put immediately on to the paddle-shaft which crosses the boat, occupying the centre of the boat; or two smaller wheels may be used, placing them near to the sides of the vessel, and on each side of the boiler, which boiler may be in the middle.

As stated before, the motion produced is one continued, steady rotation; there is no waste of steam in the operation, and not an atom of steam goes into the wheel but what *must* exert its whole force—a subject to no unequal pressure, no

retardation or jerking (inseparable from the use of cranks)—no minor parts of machinery to get out of order—no friction except the shaft in its boxes, the steam collar, and the sliding of the gravitating weight through the rim; its advantages also in *time saved* are as much superior to engines on the *old principle*, as a *wheel lathe* is to a *pole* one. The cost of construction will not exceed one fourth the price of an engine on the old principle, nor occupy more than one fifth of the usual space—can be worked on either the high or low pressure principle; when for the latter, he adds a small wheel of the same description, on the same shaft, and not over 4 feet diameter, or 3 inches square in the rim, for an air pump; and makes double steam pipes in the working arms of the large rotatory wheel.

It must be highly gratifying to the lovers of science in general, that this highly important discovery of a new application of steam has been made, and to learn that this engine, which has occupied the attention of scientific gentlemen and practical mechanics, both in Europe and America, from the early days of the highly gifted Watt to the present time, should at length have been discovered amidst the forests of New-Brunswick, by an unassuming mechanic, among other pursuits occupying his winter evenings' amusement.

Labor omnia vincit.

\* Each working arm is fitted with sliding valves worked by hand gearing, for starting the machinery, or reversing the motion.

in motion. The wheel, as here represented, shows the position of the gravitating weight when working at a high pressure. When the steam gets at a lower pressure, the weight will gravitate and balance lower, and the valves open at a different part of the circumference; and as the opening and shutting of the valves depends on the position of the weight, and are governed by it, they never can come in contact with it, except as exactly wanted. The hand gearing is not represented on the plan, because there are several methods of fitting it; and on so small a scale it would be impossible to give a clear representation of any of them.

*Extract of a Report upon the Employment of Hot Air in smelting Iron with Charcoal.* By M. E. GUEYMARD, Engineer-in-Chief of Mines.

A successful experiment in the smelting of iron by the aid of the hot air blast, has been made at the furnace of Riouperoux, (Depart. of Isere.) In this furnace, the distance from the blowing machine to the tuyere was insufficient for the erection of the apparatus for heating the air which the machine furnishes; they were obliged, therefore, to make the conduit pipe semicircular.

Six kilns, or ovens, were made with one chimney, 54½ feet, (French,) high, placed against the stack of the furnace. The fuel used in them was anthracite, which was applied to heat a pipe eight inches in diameter, and ten feet long; the part of the tube which traverses the fire was protected by a coating of fire clay, one inch thick, covered by a shield of cast iron, which received the direct action of the fire.

Five months' work have proved the efficacy of this arrangement; the expense of the construction of the apparatus for heating, including a tube for water, amounted to the sum of 5,009 francs, (1,001 dollars.)

Upon the blast pipe, and close to the tuyere of the furnace, is placed an air gauge, and a thermometer. The consumption of fuel by the air oven has been fixed at 150 kilog. (300 lbs.) of anthracite in twenty-four hours.

The experiments were commenced on the 3d of April; the fires were lighted in succession, and, on the 15th of May, five of them being lighted, the temperature of the air was raised to 125° R., (313° Fah.) and even as high as 130° R., (324° Fah.)

Before the introduction of hot air, the furnace was charged each time with 65 kilog. (130 lbs.) of soft charcoal, and with 77 litres (2½ cubic feet) of ore.

Gradually the hot air was introduced, the temperature being raised more and more. They have been able to use with the same load of charcoal, quantities of ore increasing as 82, 87, 91, 102, and up to 105 litres; a quantity which has not been exceeded. It was observed that, at this maximum charge, the scoria, or slag, was more liquid, and the metal of a better quality, and finer than before.

The consumption of the five fires was 750 kilog. (1500 lbs.) of anthracite in twenty-four hours.

When they worked with cold air, the mouth of the tuyere was eighteen lines, (1½ inches,) in diameter, and the pressure of the air equalled twenty-four inches of water. Upon the introduction of the hot air, the diameter of the mouth was increased to twenty lines, (1½ inches,) and the pressure decreased to twenty inches. The number of charges were forty in twenty-four hours, in the first case; but in the second, they could not exceed thirty-four or thirty-five. Afterwards, having restored the pressure to twenty-four inches, they were enabled to increase the number of charges to forty.

The economy of fuel by the use of hot air, at the furnace of Riouperoux, may be estimated by the results of the castings made during the month of June, being about the average of three months' experiments, and about the same with those of the months of July and August.

During the month of June, 57,989 kil. of pig iron were made by the consumption of—Ore, 110,400 litres; charcoal, 1,104 charges.

To obtain the same quantity of metal by using the cold air blast, would have required 1,434 charges of the same charcoal. There was, therefore, a saving of 330 charges, of which the value, at 5 frs.

per charge, = f. 1,650

Add 8 days' work of workmen, at 19.36 f., 154.88

1804.88 = \$360.98

Deduct for the expense of heating the air,

Attendance of fireman, 45

21,500 kil. anthracite, 516

Interest, 10 per cent.,

on cost of the heating apparatus,

41.10

602.10 = 120.42

f. 1202.78 = \$240.56

The benefit resulting from the employment of hot air was, for one month, 1202.78 francs, (\$240.56,) or 2,072 f. (\$4.14,) per 1000 kilog. (20 cwt.) of the casting produced. This is the minimum gain. Since, the general expenses are not given, and refractory mixtures of ores have frequently been used, during the month of June. It must be observed that the saving of 21,450 kilog. (42,900 lbs.) of charcoal, made in the casting, had required a consumption of 21,500 kilog. (43,000 lbs.) nearly an equal weight of anthracite, of which the value is much less than that of charcoal.

The tuyere was burnt through three or four times in twelve hours, an inconvenience which was remedied by surrounding it with water, after which the working of the furnace became perfectly regular.

The sixth fire having been lighted, the temperature of the air was maintained at 130° R. (324° Fah.), and was sometimes raised above; but no change was found in the working of the furnace, nor could the charge be increased beyond 105 litres

(3½ cubic feet) of mineral, to 65 kilog. (130 lbs.) of charcoal.

The dimensions of the tuyere mouth, and the pressure of the air, were varied, and the results were always inferior to those already stated; so that the maximum effect produced, with the mixture of ores employed, was, with a pressure of twenty-four inches of water, a diameter of tuyere of twenty lines, the temperature of the blast, 130° R. (324° Fah.) and 105 litres of ore to 65 kilog. of charcoal.

A mixture of more refractory ores than the preceding, and which could not be smelted with the cold air blast, was reduced with much facility, but the charge of ore could not exceed 100 litres. It should be remarked, that the temperature of the blast, which appeared to give a maximum effect at temperatures not exceeding 130° R., was much below the temperature of melted lead, (604° Fah.) to which it had been carried in the experiment made at Vienna in a coke furnace.

*Remarks on the foregoing, by the French Editor.*

1. M. Gueymard has correctly observed, that unless the air can be heated by the flame which issues from the mouth of the charcoal furnace, those who are not able to procure a cheap combustible for the heating furnace, and continue to work with cold air, must be most unfavorably situated.

Happily, the attempts made in Germany, and the apparatus there contrived, and which has already been imitated in France, have shown that the flame which escapes from the furnace will heat to a proper temperature all the air which is required. It is recommended that at furnaces where charcoal is used, the heat which would otherwise be wasted shall thus be used, instead of the separate apparatus for heating air, thus augmenting the profits of smelting with heated air, by the whole value of the combustible consumed in the fires.

Thus at Riouperoux, the saving which has been made of 1202.10 fr. will be carried to 1763.78 fr. per month, or to 30 fr. per 1000 kilog. of iron produced, in place of 20 fr.

2. The best plan yet presented for heating the air by the flame at the top of the furnace is the following, which differs a little from that employed at Wasseralfingen, and described by M. Volz. The air required for the blast is passed through twenty small columns or vertical tubes, four feet long by two inches and a half in diameter, which are placed in a space or oven near the mouth.

By this means, the air is more heated, and there is less friction, than by passing it through a long tube horizontally, because the air passes slower, and has only four feet to traverse.

The diminution of the resistance to be overcome by the blowing machine is considerable and very important, because the water courses are frequently hardly sufficient, during the summer, to furnish the quantity of air necessary for the consumption of the iron furnaces.

3. The temperature of the air thrown

into the furnace of Wasseraifngen, has been raised constantly to 165° R. (403° Fahr.) and often to 210° R. (504° Fahr.) with increased effect.

M. Gueymard, on the contrary, has observed that the production of iron was not augmented by an elevation of the temperature above 130° R. (324° Fahr.)

At Wasseraifngen, with the air heated to a temperature varying from 165 to 210° R. (329 to 400° Fahr.) to produce 1000 kilog. (2000 lbs.) of iron, 1130 kil. (2260 lbs.) of charcoal was consumed, in place of 1730 kilog. (3460 lbs.) burned when the cold air was used. The weekly production has been carried from 527 local quintals to 734 quintals—equal to 357 metrical quintals, ( lbs.)

At Riouperoux, with the air heated to 130° R. (266° Fahr.) they have consumed for 1000 kilog. (2000 lbs.) of castings, 1270 kilog. (2540 lbs.) of soft charcoal, in place of 1610 kilog. (3220 lbs.) with cold air.

The differences between the results obtained in these furnaces are not considerable. It is remarked that in both the quantity of charcoal consumed in twenty-four hours is not augmented, but the charge of coal, and the daily produce of casting, has, by the employment of the hot air blast, received a considerable increase.—[Annales des Mines.]

[From the London Mechanics' Magazine]  
*Improved Portable Fire-Ladder.*

SIR: I have several times had occasion to notice the improved fire-ladders employed by the London Fire Establishment, and as I may frequently have to refer to them again, I take this opportunity of forwarding a description of them for instruction in your Magazine, the more particularly as they cannot be too well known.

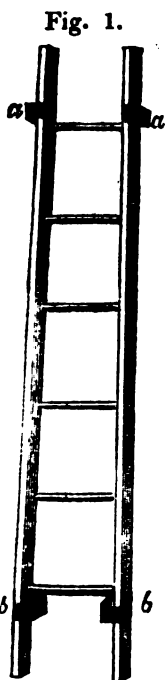

Fig. 1 is a representation of one of the single ladders, on a scale of half an inch to a foot; the top of the ladder is

so made, as to slip into the lower part of another, and the iron straps *a a*, and *b b*, embrace the ends, making a safe and substantial joint. As every ladder in the service is made precisely alike, it matters not in what order they are taken, as all will fit one another.

Every engine carries two lengths of these ladders, so that on all occasions the firemen can command a ladder of any required height, by joining a sufficient number of lengths together, and they have frequently found them of infinite service. When used, the first ladder is held as high as the men can conveniently reach, and a second ladder is pushed up to it, the top pieces going into the straps *b b*, while the lower ends of the first ladder enter those marked *a a*, making a secure joint; the second ladder is then raised, and others added until the required elevation is obtained. Three ladders, which will reach about 18 feet, are easily handled; but when four or more lengths are to be joined, the raising of them becomes more difficult in proportion to the height; every little projection in the wall, against which they are raised, catches the ladders, and impedes their ascent.

Fig. 2.

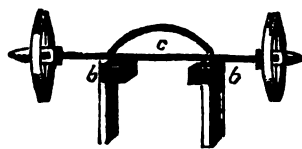

Fig. 2 is a sketch of a simple piece of apparatus, which I have contrived, for obviating the above difficulties; it consists of two short side-pieces, corresponding to the bottom part of a ladder, with the joints *b b*. On the upper part is an iron axle, carrying a pair of small light wheels; a semi-circular connecting-rod of iron preserves the proper position of the side-pieces, when not mounted on the ladder. For convenience of stowage, the wheels take off, when the whole lays flat in a small compass. Each end of the axle *c* is provided with rising springs, similar to those in an umbrella-stick, which allow the wheels to be slipped on the axle, but effectually prevent their sliding off again until the springs are depressed. These springs answer the purpose of linch-pins, without the trouble attending their use, and thus enable the apparatus to be fitted up for use in a few seconds. When mounted with this carriage, any number of lengths may be joined, and the compound ladder run up with the greatest facility, as the wheels would traverse all the inequalities of surface, cornices, window-sills, &c., without subjecting the men to any unpleasant jerks and strains.

Some few provincial fire-offices have adopted this kind of ladder, and I have no doubt that when their advantages are sufficiently known, and duly appreciated their use will become very general.

I remain, Sir, yours respectfully,

WM. BADDELEY.

London, Dec. 10, 1834.

*Specification of a Patent granted to HENRY CRANE, Merchant, and JOHN YOUNG, Patent Lock Manufacturer, for their invention of certain improvements in the making, manufacturing, or forming, of Iron Hoops for Casks, and other purposes.—Sealed 20th March, 1834.*

These improvements in making, manufacturing, or forming, of iron for hoops for casks, and other purposes, consist in giving to the narrow strips of hoop iron a curved figure; that is, bending the strips of iron from the usual straight form in which they are delivered by the ordinary operation of rolling, into such a curve suited to the diameter of the barrel round which the hoops are intended to bind, as will enable them, when formed, to lay close to the conical or elliptical surface of the barrel. This is effected by a peculiar method of acting upon the strips of iron by means of rollers, in order that such required lengths of iron, when cut off and bent round into the circular hoop shape, may be formed slightly tapering, or as the frustrums of cones.

The method by which this is effected, is by drawing out the bar or rod of iron by rolling, in the first instance, in a heated state, in the usual way, until it has been reduced to nearly the required thickness; we then set the rollers, so that their axes incline at a slight angle from the true parallelism, by which means the peripheries of the rollers will be nearer together at one end than at the other, and the strips of iron being then passed between these inclined rollers, will be necessarily compressed, or formed on one edge thicker than at the other edge—that is, of a wedge shape, if cut in a transverse section. This may be done by relieving the screws which confine the axle at one end, and tightening them at the other end; or the same might be effected by making the grooves and ribs of the two rollers inclined to each other, instead of parallel.

When the strip of iron has assumed this wedge shape, in its transverse sectional figures, we then pass it, in its heated state, between a pair of parallel rollers, which, by pressing principally the thicker part of the substance of the strip of iron, causes that thick part to expand and elongate more than the thinner part of the strip, and, consequently, to extend or elongate the strip more on one edge than on the other.

This mode of operation will cause the strip of iron, as it is discharged from the parallel rollers in the last instance, to assume the form of a regular curve, and which curve may be varied to suit any required diameter and inclination of the surface of the cask, or barrel, by varying the inclination of the rollers, or the bevel of the groove, by which the strips are compressed into the wedge shape, that is, thicker on one edge than on the other; and in order to prevent the strip of iron from bending into irregular curves, as it passes in its heated state from the rollers, we have found it useful to place a curved guide, or conductor, near the rollers, which will enable the workman, as he

draws out the strip of iron from the rollers, to preserve its desired figure with great accuracy.

Lastly, we wish it to be observed, that as the rolling of iron, for the purpose of bringing it into thin and narrow strips for the manufacture of hoops, is not new, of course that process is not to be considered as claimed by us; but the taking of strips of iron, previously made thicker on one edge than on the other, and passing them between parallel rollers, for the purpose of expanding the metal on one side of the strip more than on the other side, and thereby giving to the strip a curved figure as it is discharged from the rollers, being, to the best of our knowledge and belief, new, and never before employed by any other person, or persons, in the manufacturing of hoops, we claim that mode of operation as our invention, and forming the essential feature of our present patent right.—[*Lond. Journ.*]

#### AGRICULTURE, &c.

[From the *New-York Farmer.*]

*Adam, the Gardener.* By CHARLES COWDEN CLARKE, Author of *Tales in Prose from Chaucer*: Revised by the Editor of the Popular Library. Boston, JOHN ALLEN & Co., 1835, 16mo., pages 252.

Every attempt to implant a love for rural pursuits in the breasts of youth should be very favorably regarded—as likely to be productive of great and varied benefit, not only in reference to the increased capabilities of adding to the physical resources, but to the moral worth, of the rising generation. With pleasure, therefore, we opened this little volume. Its perusal has led us to approve both of its contents, and of the taste and judgment that selected it to form a part of the *Juvenile Popular Library*.

Although the work was written, so far as practical directions are concerned, for the climate of England, yet it abounds in so much that is of general interest, and the whole, too, is in so lively and pleasing style, that no youth can fail of deriving pleasure in its perusal. For those of our own country, residing south of New-Jersey, much of the practical information is very appropriate, and much needed.

Mr. and Mrs. Stock, the parents of Adam, appear admirably qualified, or rather properly exert themselves, to teach the young idea how to shoot. The following extracts, under the head of *March*, are lengthy, but they convey so many useful suggestions to parents, and afford so much for a just comparison of the climate of England with that of the United States, that our readers will not, we presume, think them unworthy the space they occupy in our columns.

#### MARCH.

"As yet the trembling year is unconfirm'd,  
And winter oft at eve resumes the breeze,  
Chills the pale morn, and bids his driving sleets  
Defume the day, delightful."

At length, array'd  
In all the colors of the flushing year,  
By nature's swift and secret-working hand,  
The garden glows."

"The last two or three days of February, and the first week of the present month, March, were so stormy, and attended with such floods of rain, that Mr. Stock found it was of very little use attempting to do any thing in the garden; he therefore told Adam, that as the weather was so unfavorable, he should take advantage of it, and get on as fast as he could with his arithmetic and geography; 'for,' said he, 'you know how often I have told you that the real meaning of *independence* is our being able to do every thing for ourselves. Now, you are aware, that no man could be able to prepare and make *every thing* he wanted. A North American Indian, or any other wild man, would, because his wants are fewer than ours; every thing he requires, he can make. His mat for a bed; his bow and arrows, and fishing lines and nets, to procure him food; and he can build himself a hut. But we are brought up in a different manner from these people, and our habits of life compel us to stand in need of many things that an Indian never thought of. Therefore an Indian is more independent than we are. But, if we choose, we may be very independent, too; and the way is, by getting all the useful knowledge we can; by being diligent in our business, and contented with what we gain. Now, Adam, you will never be an independent man if you know no more of arithmetic than you do at present; because you will not be able to calculate the value of the things which you wish to sell, but must have a person to do this for you; and then you will be *dependent* indeed. You cannot think of this too often, that if you wish not to be in the power of any man living, (for that is being *independent*;) you must acquire all the knowledge possible; be honest, and be contented."

"This dreary week having passed, and Adam, to say the truth, tired of confinement, the weather cleared, and a brisk wind sprung up, which, after a few hours, dried the surface of the ground so that they could go to work. Mr. Stock told Adam that this would be a very busy month for them. 'In the first place,' said he, 'we must weed the beds which we sowed the last two months. The onions, the parsnips, the carrots, the lettuces, and, indeed, all the beds. And if we persevere now, while the weeds are young, we shall keep the garden clear, and benefit the plants. But you must be very careful, and distinguish the weeds.' This was a tedious task, and Adam began to be wearied; but as his father helped him, and kept steadily at it, he did not complain. When they had finished, his father showed him how to dress the artichokes, and take off the suckers for fresh plants. Afterwards he saw him fork up and rake up the asparagus, and sow the seeds for fresh beds. When this was done, they sowed some more beet-root, beans, and broccoli, for the first crop; carrots, parsnips, and onions, for the principal crop, and for the winter. His father showed him, too, how to prick out the celery, and plant it: and then they transplanted the young cauliflower plants which had been all the winter under glasses: they also sowed radishes and mustard and cress, covering up the beds from the cold winds. 'Now, Adam,' said his father, 'you may take the barrow, and wheel in some manure from the yard, and we will make a cucumber bed. When we have finished this, we will plant out our potatoes; and I will show you how to cut them into quarters, so as to leave in each partition what is called an eye; for where there is an eye, there will be a shoot, and a fresh plant. And when this is done we will sow two or

three more rows of our favorite peas; and we will have one or more beds of turnips." All this, I should suppose, occupied them nearly a fortnight. During the time they were at work, the season was very various. It might truly be called 'March many-weathered;' for in the course of one day they had wind, and sunshine, snow, rain, and fierce storms of hail. 'It is well, Adam,' said Mr. Stock, 'that we covered up our tender flowers, and screened the fruit trees; or the opening blossoms would have suffered bitterly from the slanting bullets of the storm.' But we must not complain; for all this violent weather had better come now than later in the year, when our blossoms would be more opened. And indeed, it is pleasant to have the gleams of sunshine after the dark storms, and to see the great clouds moving before the wind like mountains of snow, and to watch the shadows of them passing over the ploughed lands; and when they are far off, to see the showers descend in long streaks. See, now, how beautiful those pigeons look, hurrying home after their meal, with the black cloud behind them! Then we have the lively song of the chaffinch between the showers. It is of the greatest service to the rising vegetation to have these changes of rain, wind, and sunshine; because the moisture is allowed to sink to the roots of the plants, and the warmth of the sun brings them and the seeds forward. \* \* \* \* \*

"Come, you shall help me plant out these few sweet herbs, which I sowed last year; and here we will have a row of parsley; then, if the weather be likely to hold up for the remainder of the day, we will dine early, and take a long walk.' They did so, and away they all went. By the side of a farm-yard, on a dead branch, at the top of an elm tree, they heard a thrush making the homestead ring with his fine note. Their father told them that, if they were now near some wood of beech trees, they would hear the ring-dove cooing, and perhaps the crowing of pheasants, the most beautiful birds in our country. 'The rooks also are now in a great bustle,' said he, 'building their nests; and as the spring is fully set in, and the air mild, I make no doubt we shall see the bat fluttering like a butterfly around the farm-yards in search of gnats and other insects, its food. I told you, if you recollect, that the bat is one of the animals that remain *torpid* all the winter; that is, that it *sleeps* through the whole of that season. It is generally to be found in the roofs of thatched cottages, and in small holes in the walls of old out-houses, hanging by the hind legs, and covered over with its wings. If you had found one during the severe weather of January, and had kept it in your hand for some time, or placed it near the fire, it would have awakened and begun to fly about. But it would be a cruel thing to do so, for as there is no food for it at that time of the year, the little creature would certainly die.' Adam said it could go to sleep again. 'Yes,' said his father, 'so it could; and sometimes, when we have two or three warm days during the winter season, they will awake and come from their hiding-places; but then the same warmth brings forth the insects which are their food, and when the frosty wind returns, they do go to sleep again, well fed. But if you were to rouse one by bringing him to the fire, he would wake almost starved from his long fasting, and would flutter about in search of food. If he did not soon meet with some, being so weak with hunger, he would very shortly die.

(To be continued.)

*Political Agriculture.* By H. C. [For the Quarterly Journal of Agriculture, Mechanics, and Manufactures.]

(Concluded.)

The memorial of the subscribers to the Congress of the United States, respectfully represents:

That agriculture is the great interest of every civilized community—the mother of all the arts—and the basis of all national prosperity—and in this view claims the fostering care of every patriotic and enlightened government.

That the United States of North America is, and must continue to be, essentially an agricultural people; and that an improved agriculture must directly and most favorably conduce to its manufactures and commerce, and to the substantial comfort and best interests of the whole people.

That the agriculture of the United States, although in an improving, is yet in a very imperfect condition; the resources of the country are very partially unfolded; the cultivation yields by no means those ample returns which it may be made to command; and is far from that improvement and perfection to which it may with the highest advantage be advanced.

That it would contribute essentially and immediately to this object: that a general agricultural survey of the whole country, should be undertaken and gradually prosecuted to its completion. That this survey should embrace the actual condition of its agriculture in different parts of the country, going, as far as practicable, from personal observation and intercourse with the most intelligent and successful cultivators, into detailed and statistical accounts of the crops cultivated, the modes of cultivation, the average yield, the value and application of labor, the disposal of the produce, the implements of husbandry, the condition and capabilities of the soil, the improvements of which the agriculture of any particular part of the country is susceptible, and, in general, whatever may be immediately connected with its agricultural advantage and prosperity, particularly in the manner of Arthur Young's Agricultural Tours, Radcliffe's Survey of the Agriculture of Flanders, the County Reports of England, Sinclair's Reports of the Agriculture, and his particular account of the Husbandry of Scotland.

That such survey should particularly embrace the cultivation of the leading products of the country—maize, wheat, cotton, sugar, tobacco, hemp, wool, and silk; the cultivation of the most valuable forest trees; together with other crops and products not less essential to comfort and use, but of less comparative importance and extent; and the character, rearing, and management of every species of live stock.

That the information thus obtained should be immediately furnished to the Government, and measures taken for its general diffusion.

Your memorialists would further respectfully suggest, that to accomplish this most valuable object, there be appointed a joint and standing committee of both Houses of Congress; or otherwise, there be

selected, in any mode deemed best, as many as five individuals from the citizens at large, who shall constitute a Board of Agriculture for the United States.

That there be appointed one or more competent individuals, whose duty it shall be to prosecute such survey; and whose further duty it shall be to be in attendance upon the Board of Agriculture at Washington at least one month during every session of Congress; and to them make a full report of his or their doings, surveys, and travels; and who shall themselves act as Secretaries to said Board.

That it shall be the duty of said survey, or or surveyors, to spend at least — months in every year, under the direction of said Board, in the actual and personal survey of different parts of the country, with a view to obtaining and diffusing the fullest agricultural information; and that he or they shall present a written and full report of all his or their doings and observations annually at the first meeting of the board.

That it be the duty of the said Secretary or Secretaries, under the sanction and direction of said committee, to procure models of all new and valuable machines to be employed for agricultural purposes, one of each kind of which, as far as may be adapted to that part of the country, shall be deposited at Washington, and at the seat of government of each State in the Union; to open a correspondence with distinguished individuals abroad, and in different parts of the country, on the subjects of agricultural interest and improvement, and to obtain and circulate such valuable seeds or plants for agricultural purposes as it may be desirable to introduce into the country, or diffuse in different parts of it.

That it be the duty of the said Secretary or Secretaries to manage and superintend, under the sanction and order of said Board, the publication and distribution of such reports and papers as may be deemed of general utility and importance.

That for these objects there be annually appropriated the sum of — dollars.

Such, Mr. Editor, are the outlines of a plan, simple enough, in my opinion perfectly feasible, and of the most obvious and highest utility; and the expense of which, compared with the public advantages to accrue from it, would be of no consideration; and compared with other expenditures of the Government for objects of far more doubtful utility, would be hardly a drop to the ocean. How many individuals it might be necessary to engage in such survey, and how long a time might be occupied in it, would be matters of further consideration. One active, intelligent, and practical man might accomplish it. Two would doubtless be ample. It would not be an affair to be hurried, and the statistical information to be collected would require great care and exact inquiry. Six years would not be too short a time, if the country were divided into two great sections, to accomplish it in a proper manner.

As the survey progressed, much valuable matter would be gradually elicited. Every farmer and planter of any consideration in the country would be excited and interested by it; would from patriotic motives be emulous to communicate all the information in his power; and from personal considerations, would be anxious to put his property in the best condition for examination. Massachusetts has already set the example of a thorough and able geological survey of her territory. New-York has done the same in respect to several of her counties; but, precisely to what extent, I am not apprized. An agricultural survey, conducted in the manner above described, would be of more value, and might itself be instrumental of furnishing much geological information; and exposing many of the mineral as well as vegetable treasures of the country.

I shall not now go farther into detail of the advantages which I think would accrue to the country, if this project could be intelligently and properly executed. I hope it will not be regarded as wholly visionary. I offer these suggestions with diffidence; but with the strong desire that they may attract the attention of some of our distinguished statesmen and citizens, who estimate justly the importance of an improved agriculture, and are willing to labor at its advancement; and that it will call out from such men opinions and discussions, which, if not favorable to it, will lead to wise and better plans. No one will listen to such opinions with more satisfaction, or co-operate, in any useful and feasible projects for the same objects, as far as my humble power extends, than myself.

H. C.

Meadowbanks, Jan. 30, 1835.

*Surinam Potatoe.* By ALEX. EDGAR.  
[For the New-York Farmer.]

MR. FLEET,—Among the many excellent varieties of potatoes cultivated in America, the yam, or Surinam potatoe, is not to be found. It has been long known in Scotland, and cultivated to a great extent for the purpose of feeding cattle. The produce is from 15 to 20 tons per Scottish acre. It is an excellent substitute for turnips in the spring of the year, when turnips are done. It will grow on soils too that the common turnip and ruta бага would not yield roots exceeding a common sized egg. Yams present every advantage which can be got from ruta бага, and are not so peevish in their growth. Their culture is a matter of far less difficulty, as such will grow upon soils where ruta бага would starve. They require less manure, and may be planted as late in the season as the others, thereby enabling the farmer to bestow the like previous preparation upon the ground, the want of which is a general argument against ordinary potatoe husbandry. If you think the above lines worth a place in the Farmer, they are entirely at your service. I have read your Farmer seven years, with the greatest of pleasure and profit too; and was it in my power, there should not be a farmer nor a gardener in

possession; for without reading, a farmer may plough and mow, and a gardener may dig and hoe, to the end of their existence, and then know but little of the art of their profession.

ALIX. EDGAR.

Hartford, Conn., Jan. 22, 1835.

*A Substitute for the Lima Bean.* By WM. PRINCE & SONS. [For the New-York Farmer.]

DEAR SIR,—We think the point has at length been attained of obtaining a substitute for the Lima Bean, suited to a more northern climate than that very tender variety. The *Prolific Lima* is of recent introduction, and not having been cultivated beyond the limits of two or three gardens, is absolutely unknown to the American public. It is white, or rather cream-colored, nearly the size of the Small Lima, but exceeding it in thickness, and has a peculiarly rich appearance, which is verified by its quality. It fully equals, and it is even contended that it excels, both the other Lima varieties in richness; is at least two weeks earlier, and its produce is far greater, we think we may say four-fold. Like the Lima, it is used as a shell bean, and we think, from its various advantages, it promises to rival that variety even here, and to supersede it in more northern latitudes. We do not invite applications for it, having only a small supply of two bushels, but in the autumn of the present year all applicants can receive such quantity as they desire. The Dwarf Bonavista Bean also deserves particular notice for its remarkable richness and delicacy, and may be considered as holding the same rank in this respect among the dwarf or bush varieties that the Lima does among the climbers; it is also exceedingly prolific.

We intend, in a future communication, to mention the public spirited individual to whom our country is indebted for the introduction of the *Prolific Lima Bean*, and other very choice horticultural productions, in a manner better calculated to do him justice, as a *public benefactor*, than we could possibly do in this short article. Yours, very respectfully,

WM. PRINCE & SONS.

Linnæan Botanic Garden, Flushing,

*On Chess.* By FARMER C. [For the New-York Farmer.]

MR. EDITOR,—In looking over old papers not long since, I was somewhat pleased with a description of the plant commonly called "chess," by a New-England farmer, in some of the last numbers of the fourth volume of the New-York Farmer. I here give a contrary opinion to his.

The vulgar opinion respecting the origin of the chess plant is too well known to need at this time a particular account. It may not be generally known, that many farmers are quite indifferent about its being mixed with seed wheat or rye, asserting that it is not produced by its own seed. When error of opinion results in a practice so absurd, it is time for those who know better to enter a protest. It

is frequently inquired, if chess does not come from wheat, why do we find it on new ground where wheat is the first crop, and where chess has never been sown? It is a circumstance familiar to all who are acquainted with clearing land, that in places where fire passes over the ground, many plants spring up and grow spontaneously, and where log-heaps have been burned, we have frequently seen the earth entirely covered with sumach (*Rhus tyhinum*), and fire weed (*Senecio hieracifolius*). Now, chess, when mixed with wheat, is extremely deceitful, and we conclude it may either have been sown unperceived with the grain, or it may have been scattered by birds, or otherwise. This seed is so small as to render its detection, to a careless observer, improbable. It is true, botanists have given us a list of hybridous plants, but the chess has not suffered the disgrace of being placed on the catalogue; nor is it pretended by the advocates of this belief, that seed-wheat, from which this monster is said to rise, is guilty of vegetable adultery. They admit that the wheat plant may rise perfect from the ground, but after being injured by cattle or unfavorable situations, its nature becomes changed, and the stalk, instead of being crowned with the golden grain, is only burdened with the shrivelled chess. Now would it not be perfectly safe to assert that nothing analogous to such transformation can be produced from the vegetable kingdom: we here remark, that chess, though a weaker plant than wheat, is yet more hardy, and where that grain is thick and flourishing, the chess drops among the stubble; but when the winter, cattle, or excess of moisture, have injured the wheat, the other shoots forward with renewed vigor, and fills the vacancy. Chess is a perfect plant, as different from wheat as that is from other grain, with seed completely capable of vegetating, and known in science by the name of *Bromus secalinus*. Botanists, whose observations are incomparably closer than the asserters of this doctrine, would no sooner admit this plant to be a degeneracy of nature, because it grows in our wheat fields, than the zoologist would admit a goat to be the degenerate offspring of the cow, because they fed in the same pasture.

FARMER C—.

Manlius, Jan. 20, 1835.

*Produce of a Small Farm.* By H. C.  
To the Editor of the New-York Farmer.

MR. EDITOR,—I procured from an esteemed neighbor, Mr. Horatio Hoyt, the subjoined account of the produce of three and a half acres of land in Deerfield, Mass., in 1833, a result highly creditable to the cultivator and the soil; and which, I presume, will be interesting to some of your readers. We do not say that it is more than others have done or can do; very far from this; but we hope it may induce others to say what they have done or can do, for such communications cannot fail to be interesting and useful to the agricultural community.

The produce is estimated at the market prices at the time.

Yours, respectfully,

H. C.

Hay, 3½ tons, at \$12 per ton,	\$42 00
Wheat, 11 bushels, at \$1 50 per bushel,	16 50
Stubble and clover, 1 ton,	4 00
Corn fodder, stalks, blades and husks, 3 tons,	10 00
Corn, 120 bushels, at 80 cts.	96 00
Potatoes, 117 bushels, at 20 cts.	23 40
Apples, 60 bushels, at 12½ cts.	7 50
Pumpkins, 1 cart load,	

\$199 40

**BURYING TURNIPS.—OUT-DOOR CELLARS.**—Early in last December I slightly buried some turnips with straw and earth in a situation well protected from cold winds, and exposed to the sun. In the latter part of January I took them out. Notwithstanding the previous very severe weather, they were in growing state, having sprouts half an inch long. My impression is, that a shady, cool situation is preferable, although it is probable that the heat exists in the turnips.

In an out-door, or dirt cellar, there were, in a little cooler place, a considerable quantity of potatoes. During some of our most severe weather, the temperature in this cellar was such as to cause the evaporated moisture from the potatoes to remain in small drops on the rafters and planks. Such cellars are far the best for preserving vegetables. They should be well covered with earth, and very tight about the door. A small aperture at the top, rising in steeple form, two feet above the outer surface, should be made for a ventilation. S. F.

**INFLUENCE OF COLOR ON HEAT, THE DEPOSITION OF DEW, AND OF ODORS.**—Dr. Stark, in a paper in Jameson's Journal, vol. xvii. p. 65, has shown, by experiment, that one principle operates in the production of all the above results. A black color, whether in solids or fluids, absorbs heat more rapidly, and parts with it most rapidly; dew is also deposited more rapidly on this color than on any other, and with proportionate rapidity evaporated from it. Odors, whether agreeable, offensive, or of infectious diseases, are, in like manner, absorbed with greater rapidity, and in greater quantity, in a given time, by black colors; and discharged by these colors with proportionate quickness. The other colors are next to black in the order of blue, brown, green, red, yellow, and lastly white; which last absorbs and gives out heat, dew, and odor more slowly than any other color. These facts will afford valuable hints to gardeners for the colors of walls, of walks, of rockwork, of soils, of coverings for protection, and even of their dresses.—[Gard. Mag.]

**NEW POTATOES.**—We were shown last week a quart or two of new potatoes, just out of their warm bed. They were raised by the gardener of Col. B. C. Howard, and have come to their present state from the planting within the last seven weeks. One of them now before us is about an inch in diameter. They are of the kind called in our catalogue "earliest white."—[Baltimore Farmer.]

## NEW-YORK AMERICAN.

MARCH 7—14, 1835.

## LATE FROM FRANCE.

The *Rhone*, packet ship, from Havre, brings Paris accounts to the 11th ult. They are highly favorable, certainly, to our affairs.

The various bureaux into which the Chamber is divided, have each elected a member to compose the committee to which the examination and preparation of a Report, on the American indemnity, are confided. Of these nine members, all but one are said to be in favor of carrying the Treaty into effect. M. Delessert, who is chosen the Chairman and Reporter of the Committee, is understood to be clear and strenuous in that opinion.

We feel great confidence that as our Havre P. S. states, "all will be well" with the treaty.

The course of the thing was this. On Thursday and Friday, 5th and 6th February, the Chamber, in its bureaux, and *not in public sitting*, discussed the proposed law. After the discussion in each bureau, and when the sentiments of members were ascertained, the committee of nine was formed by one from each bureau. One only of the nine bureaux was—not hostile to the project—but in favor of reducing the amount proposed.

On the 7th February the report of the Senate's unanimous vote reached Paris. It is thus announced by the *Journal des Debats*: "This is a fresh and striking censure of that portion of the President's Message which concerns France."—Such, certainly, was not its character, for it sustained the leading views of the Message, though objecting to the remedy proposed.

We annex various letters received by us, and copy some from the *Courier and Enquirer*.

## Extract of a letter dated

PARIS, 6th FEBRUARY, 1835.

As we have led you to expect, every thing has gone in favor of the American question here.—The committee chosen to report upon this subject have been seven out of nine in favor of it.—This is a further indication of the sense of the Chamber, and we now consider the majority certain, and are inclined to believe that it may be as considerable as fifty. This month, we have reason to think, will see the execution of the

## Extract of a letter to the Editor, dated

HAVRE, Feb. 7, 1835.

The Committee has been named, to examine and report on the American Treaty. The discussion will take place in ten or twelve days hence.

The Chamber is divided into nine bureaux: each names a member, and of the nine named, eight are in favor of the Treaty, that is, to vote the 25 millions. The other is for the Treaty, but thinks the sum ought to be reduced. A discussion takes place at the nominations in the bureaux, and as far as opinions could be ascertained, not only as to those named, but those not named, there must be a decided majority in favor of the projet de loi now before the Chamber.

A Postscript of the 8th says—

All going on well. The packet cannot sail to-day. If you hear nothing further from me, take it for granted there is nothing new.

The *Journal du Havre* of 7th February, gives this under the head of "Private Correspondence," dated Paris 6th. It makes the vote in our favor certain, as it strikes us.

The nomination of a Committee all ministerial, made yesterday by the bureau of the Chamber, for the examination of the American credit, must not be taken as pre-figuring absolutely the adoption of the law proposed. Many circumstances may, before the discussion takes place, and during the discussion, modify the ideas of the Chamber. It is to be remarked, moreover, that in all the bureaux many members who did not vote against the rejection of the credit asked for, nevertheless expressed the opinion, that it might be reduced.

As for the rest, never did a question witness more extraordinary changes of opinion. In one bureau M. Realier Dumas and M. Delessert, who heretofore were for reducing the credit to thirteen millions, voted yesterday for *treaty-fee*, and in consequence of this vote M. Delessert was named chairman of the Committee. Yet M. Delessert was a member of the Committee of 1831 and in the majority of that Committee which voted *thirteen millions only*.

Many Ministerial Deputies expressed opinions more or less in favor of the law, especially Messrs. Bresson, Lacaze, Malleville, and Beslay, the father, (who, like M. Delessert, was a member of the Committee of 1831.) Moreover, Messrs. Maes, Ducos, de Tracy, de Sade, Lafayette, the son, warmly advocated the law, the rejection of which they would look upon as a manifestation of want of sympathy with the American people—the people of all others whom France should look upon as her most faithful ally.

We annex the names of the Deputies who in the bureaux spoke for and against the law:

AGAINST.—Messrs. Salverte, Lepelletier d'Aulnay, Lamartine, De Rancé, Teste, Mathieu, Lacaze, Roger, Bresson, Isambert, Hector d'Aulnay, Dugabé, Lacrosse, Odillon Barrot, Chas. Dupin, Berryer, Bignon, and others.

FOR THE LAW.—Messrs. Ganneron, Bugead, Maes, Jaubert, Meynard, Realier Dumas, Anisson Duponon, B. Delessert, Amilhan, Dumon, Ducos, Ferail, De Rigny, Thiers, Poul, Palaille, Duchâtel, Keratry, Fleury De Chabouillon, Tracy, Sade, Lafayette, &c. &c.

There were at one time 406 deputies present in the Bureaux—401 ballots were received, of which about 240 were in favor of, and 161 against, the law as proposed; a majority, which a change of 40 votes would also change: and it is not impossible that amendments tending to reconcile the desire of doing what is just, with that of not approving, what through thoughtlessness, if not from speculation, is stipulated in the treaty, may bring about such a result.

The Chamber of Commerce of Marseilles has addressed the following letter to the Minister of Commerce:

MARSEILLES, JAN. 31.

An important political question, one of peace or war, is soon to be decided—shall the treaty with the United States be ratified, or a second time rejected by the Chamber? Notwithstanding the apprehension felt by the commerce of this city, notwithstanding the uneasiness which pervades it, notwithstanding the frightful prospect of disasters which would overwhelm it, in case the friendly relations between France and the United States should be interrupted, we have, until now, refrained from expressing to you, our opinion upon a question of such great interest to us.

Full of confidence in our Legislators, we were persuaded, as we still are, that imitating the example of His Majesty, they will learn how to conciliate what is required by national dignity, with what is due to the interests of commerce and industry, now so seriously menaced.

We would be among the first to offer these as a sacrifice to our country, if the national honor were compromised, but we shall not be so here, because true honor consists in being just, in repairing the evil one may have committed, in paying what one owes, in fulfilling engagements entered into. We did not suppose that truths such as these could be made matter of doubt, and therefore it was Mr. Minister that we awaited calmly the termination of a discussion in which we should see nothing to dread, if the spirit of party, for the furtherance of its own ends, had not mingled with the question.

Of a question of good faith, a point of national honor is sought to be made—the substance is lost sight of, to cavil at the form, and without examining whether the claim upon us is legitimate, we are told to look at the unbecoming manner in which it is presented; pains are taken to prevent the sum stipulated as excessive, without making any allowance for the advantages on our side from the treaty, and which ensure to our industry and to the public treasury, an immense equivalent for the momentary sacrifice imposed upon us by true national honor. No scruple is felt about hazarding our fortunate peace, which is for all France a source of prosperity: on the contrary, we are urged on to war, which will augment the debt now refused to be paid, diminish the public resources, ruin commerce and industry, and of which the whole result would be, to revive the hopes of the enemies of Liberty, in forcing into hostilities, two nations whose institutions repose upon that base.

In this state of things, and when uncertainty has already checked the activity of all sorts of industry—when all maritime expeditions are suspended, from a provident caution lest the ill under which our city has heretofore suffered so much, should be again visited on us,—we esteem it a duty to break silence, and to oppose the voice of apprehension of our citizens, to the perfidious joy of those who found upon our misfortunes, the hopes of making their reverses triumphant.

It belongs not to us to examine this question, beyond its bearings upon us. It is enough for us to point out to Government, the danger to which our commercial relations would be exposed, if a second rejection of the treaty with the United States, should become the signal for a conflagration, of which the consequences cannot be looked at without terror.

Our intercourse with Americans is immense: no one more than you is capable of appreciating it. It is impossible to presume that interests of such magnitude should be without influence upon the decision to be formed. It is to you, Mr. Minister, the enlightened champion of the interests of commerce, who have already done so much for it, that we take the liberty of addressing ourselves, in order to beg you to become our advocate in the Chamber. It is not for the commerce of our city alone that we ask your aid, but for all France—whose growing prosperity is the envy of her enemies—their criminal hopes will not be realized—peace will not be interrupted. Your opinion cannot fail to exercise great influence in a discussion of which we await the result with equal impatience and anxiety.

[Here the signatures follow.]

This document, published, as it is, in the *Journal des Debats*, must thence be deemed to have the sanction of Ministers.

## GREAT BRITAIN.

By the way of Havre, we have the following intelligence from *Liverpool*, 2d. Feb. Markets firm, with a tendency to rise. Advices express great confidence in the future.

*Liverpool*, 5th.—The market very animated on the 4th, with a rise of 1.8 to 1.4 in Cotton, was checked by the arrival of fourteen vessels from the United States.

The accounts from London are to the 6th February. They furnish little of interest.

The pregnancy of the Queen of England—which, when first alluded to in the Court Journal, was deemed a "calumny"—is confidently asserted at the latest dates; and the joy of the Tories—at the prospect of thus shutting out the Princess Victoria, and a liberal Regent—is excessive.

Mr. Manners Sutton, it seems, is to be dropped as Speaker by the Ministry, and Mr. Abercromby is to be put forward.

His Majesty will open the new Parliament in person, and will leave Brighton for that purpose on the 19th inst., accompanied by the Queen and several of the suite.—[Brighton Gazette.]

We believe that Count Pozzo di Borgo's stay

are will not extend to more than a month after the assembling of the new Parliament, as he will then return to resume his functions at the Taileries. Count Woronzow, on whom the Czar has determined to confer the post of Ambassador to this Court, will not arrive until the advance of the Spring. He was lately Governor-General of Odessa, and is the son of the late respected Count Simon Woronzow, the predecessor of Prince Lieven here, and who died in London at an advanced age in 1832.—[Chronicle.]

Joseph Bonaparte came to town from his seat in the country for the express purpose of meeting the Duke of Leuchtenberg, after he had visited and dined with the King at Brighton. The Duke and Joseph Bonaparte met at the house of a friend, where they were closeted for several hours.—[Courier.]

The report of the pregnancy of the Queen, though not officially announced, is generally believed in the higher circles.

According to calculation, which we believe to be as accurate as possible, and rather unfavorable than otherwise, the strength of parties in the Commons is as follows: Anti-Ministerialists 370, Ministerialists 237, Doubtful 51. Total 658.—[Courier.]

The opposition party are in great spirits, and are spreading reports that they have secured at least 260 votes upon the question of the Speaker-ship. This, if true, insures a majority, we should think; but we regret to see an issue taken upon such a question.—[Herald.]

LONDON, Feb. 6. Intelligence has been received of the loss of the fine American ship *Lyon*, which sailed from Liverpool on Friday.—She was bound to New Orleans, and was commanded by Captain Bursley, brother of Captain Bursley of the American packet ship *Orpheus*. The crew consisted of 14 men, including the Captain. She struck on a ledge of rocks about three o'clock on the morning of the first of February, a short distance from Portpatrick, nearer to the Irish than the Scotch coast. The wind at the time was blowing fresh from the northwest, and she immediately went to pieces. Three of the crew succeeded in reaching the nearest land, and were saved; but the remainder, consisting of the Captain and ten men, have found a watery grave. The *Lyon* sailed from the highly respectable house of Haggerty & Jerdein of this town.—[Liverpool Albion.]

#### SUMMARY.

**DIPLOMATIC RELATIONS WITH PORTUGAL.**—We find in the *Globe* of Wednesday the following notice:

**OFFICIAL.—DEPARTMENT OF STATE.**—Senor Joaquim Cesar de Figueira e Morao yesterday presented his credentials, and was re-recognized as Chargé d'Affaires of Portugal.

March 11, 1835.

**NAVAL DRY DOCK IN NEW YORK.**—The following act authorizing the construction of a Dry Dock "in the harbor of New York, or its adjacent waters," was passed at the last session of Congress.

**AN ACT** authorizing the construction of a dry dock for the naval service.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Secretary of the Navy, under the direction of the President of the United States be, and he is hereby, authorized to purchase a site, should it be deemed most advisable, and to cause a dry dock for the naval service to be constructed, upon the most approved plan, in the harbor of New York or its adjacent waters; and that towards defraying the expense thereof, the sum of one hundred thousand dollars be, and the same is hereby appropriated, to be paid out of any money in the Treasury not otherwise appropriated.

Approved, March 3, 1835.

**PROMOTIONS IN THE NAVY.**—Masters Commandant Foxall A. Parker, Edward R. McCall, Daniel Turner and David Conner, to be Captains. Lieutenants Thomas Cribb, Edward B. Babbut, James Armstrong and Joseph Smoot, to be

Masters Commandant. Passed Midshipmen Arthur Sinclair, Edwin W. Moore, Robert B. Hitchcock C. H. A. H. Kennedy, Thomas W. Brent, George M. Bache, Ezra T. Doughty, Joseph Lannan, John W. Cox, and John K. Michell to be Lieutenants.

The Constitution frigate was towed up from the lower bay to the Navy Yard, Wednesday afternoon by steamboats American Eagle and Hercules.

M. SEBASTIAN, the French Minister, his family and suite, were passengers in the packet ship Albany, which sailed from this port yesterday for Havre.

[From the *Pensacola Gazette*, of Feb. 21st.]

**NAVAL.**—Arrived here, on Sunday last, the United States Sloop of War *Vandalia*. We understand that the cold weather experienced here on the 7th and 8th inst. was felt on board the *Vandalia*, then at sea, on the South side of the Island of Cuba.

On Tuesday last the United States Schooner *Grampus*, from a cruise among the Virgin, Windward and Leeward Islands and on the Spanish Main. She is last from Guraoa and Jamaica.

The brig *Lexington*, from Cadiz, which was ashore at the Hook, got off at high water yesterday, after throwing over 2,500 bushels salt, arrived at the wharf last evening in tow of the steamboat *Heracles*. She does not leak, and has sustained little or no injury. The cargo consisted of 110 lasts salt to E. Mix, and 4 boxes sulphate bark to P. Harmony & Co.

The lighter *Walter R. Jones*, Schenck, which was engaged in discharging the cargo of the ship *Sovereign*, and blown off in the violent gale of the 27th ult., and was supposed to be lost, has we are happy to say, returned in safety.—[Gazette.]

**Affecting and unusual occurrence.**—In the midst of the public service yesterday afternoon, in the 2d Dutch Church, the congregation was thrown into a great confusion by the sudden death of the wife of Mr. Anthony Van Santford, an aged member of that church. Mrs. V. had attended church in her usual health and a moment before the painful occurrence, was observed intently fixed on the preacher, who we understand was preaching on Heb. iii 7, and had just concluded some remarks on the uncertainty of life. The first indication that any thing had taken place, was hearing what seemed a loud snore, which directed all eyes to her—her head had fallen forward—immediately she was lifted up, and it was supposed for a moment she had fainted; she breathed a few times, and then it was seen, that her spirit had departed. Most solemn admonition to all! Most affecting seal to the truths the congregation were hearing! The effect of the annunciation from the pulpit at the close of the worship, that she was dead, was indescribable.—[Albany Evening Journal, of Wednesday.]

**FROM THE SOUTH.**—By the steam packet *Wm. Gibbons*, Captain Wright, we have received Charleston papers to the evening of the 7th inst. with Mobile dates to the 24th, and New Orleans to the 21st ult.

**CHARLESTON, Feb. 7.—The Weather.**—We must again advert to this almost interminable topic, to note the disagreeable change which has taken place, giving us rain and gloom, in lieu of the lovely snow fall, cheering though cold, and dissolving into filthy mud the mantle of purity which so lately covered and adorned our streets. About 9 o'clock, on Thursday night, snow and sleet re-commenced to fall in thick showers, but were soon succeeded by a drizzling rain, which continued until morning. The whole of yesterday was raw and rainy, and attended with all the concomitants of downright bad, if not the very worst weather.—[Courier.]

**GEORGETOWN, S. C. March 5.—Snow.**—It commenced snowing in this place yesterday morning about 8 o'clock A. M. and continued until this morning. The Snow is now lying about 7 or 8 inches deep.

**NAVAL.**—The Norfolk Beacon states that the brig *Mary* arrived in Hampton Roads, left at Rio de Janeiro, 11th January, the United States ship *Natchez*, Schrs. *Enterprise* and *Boxer*, the latter 62 days from Norfolk, had experienced very severe weather, lost spars, &c. was repairing and would sail in 5 or 6 days for the Pacific. The *Eric* was at St. Salvador, and the *Ontario*, Capt Salter at the Falkland Islands—Officers and crews all well.

The steward of the *Enterprise*, who was charged with an attempt to blow up that vessel, was tried by a court martial and acquitted.

Lieutenant Arthur Sinclair, late of the United States ship *Natchez*, and 6 discharged seamen, came passengers in the *Mary*, and have arrived at Norfolk.

[From the *Mercantile Advertiser*.]

#### Auction Duties.

At our request, Mr. WILLIAMS has furnished us with the following statement of Auction Duties, paid last year, as prepared for his forthcoming Annual Register, for 1835, which we understand will be published early in April.

Amount of Duties on Auction Sales paid by Auctioneers in the city of New York, for the year ending September 30th, 1834:—

1. David Austen,	\$43,723 49
2. Lindley M. Hoffman,	28,372 68
3. William C. Haggerty,	27,449 95
4. Henry L. Patterson,	20,509 18
5. William Timpson,	15,845 02
6. Edward G. Thompson,	12,182 69
7. Richard Lawrence,	7,832 12
8. Rowland R. Minturn,	6,660 61
9. Joseph W. Corlies,	6,489 42

Total amount paid by Auctioneers in New York city, \$191,923 63  
In all other parts of the State, 1,546 51  
Total amount of Auction Duties for 1834, \$193,470 19  
Total amount of Duties in 1833, \$238,719 45

We understand that the roof of the Livery Stable in Fulton street, Brooklyn, occupied by Mr. Snedeker, fell in on Tuesday from the weight of the snow, and caused great damage to the numerous carriages and sleighs in the building, some of them having been broken to pieces.—The horses also narrowly escaped being killed. Many of the vehicles belonged to private individuals.

We learn that during the violent snow storm yesterday, the engines of the Camden and Amboy Railroad Line, going to, and coming from, Philadelphia, approached each other without being perceived until they came into collision. The guide wheels of the train for New York, were so much injured, as to prevent their proceeding, and the passengers were to wait, until one of the engines employed in clearing the rails of snow, could be got. They then again started, but did not arrive in New York until 1 o'clock this morning, having been further delayed by the war in the tanks of the engines giving out, owing to the delays caused by the deep snow on the rails.

**THE TWENTY FOURTH CONGRESS.**—The following States have elected to the 24th Congress the number of Representatives to which they are respectfully entitled.

Maine	8	Illinois	3
Vermont	5	Delaware	1
Massachusetts	12	S. Carolina	9
New York	40	Georgia	9
New Jersey	6	Louisiana	3
Pennsylvania	28		
Ohio	19		143

Being twenty two more than a quorum. Mr. Wayne of Georgia, has been appointed a Judge of the Supreme Court of the U. States since his election. There are therefore only 143 qualified to take their seats. In the following states the elections will be held as follows:

New Hampshire	4	in March
Rhode Island	2	April
Connecticut	6	April
Indiana	7	August
Missouri	2	August
Maryland	8	October
Virginia	21	April
Kentucky	13	August
N. Carolina	13	August
Alabama	5	August
Mississippi	2	May
Tennessee	13	August

97

Commodore Downes has been appointed to the command of the Navy Yard at Charlestown, (near Boston, Mass.) to succeed Commodore Elliot, appointed to command the Constitution Frigate.

We learn that Surgeon John S. Wiley, of the United States Navy, who was dismissed by sentence of a Court Martial, has been restored by the President, with the unanimous concurrence of the Senate, to his former rank in the Navy.

We are assured, and readily believe, that this re-appointment is hailed with universal satisfaction by the Navy.

**FROM PORT MAHON.**—Mr. C. S. Mead, passenger in the brig Alice, from Cadiz, informs that he left at Port Mahon on the 15th of January, the United States ship Delaware, frigate Potomac, sloop of war John Adams, and schooner Shark. All well on board. The Delaware was expected to sail soon for home. Mr. Mead also states, that an express had just reached Cadiz (30th January) from France. It was reported and generally believed, that the United States and France were on the eve of a war, which caused much excitement.

Baron DE ROXNE, Chargé d'Affaires from Prussia, and M. STEEN BILLE, Chargé d'Affaires for Denmark, left their winter residence in this city yesterday: the former for New York, the latter for Philadelphia.

**PRESENTATION OF SWORDS.**—Thursday the 20th February, was the time appointed by Governor Thomas, for the delivery of the swords which the Legislature of Maryland directed to be presented

to Col. (now General) Towson, of the United States Army, and Captain Gallagher of the United States Navy, as a testimony of the high sense entertained by their native State of their efficient services and gallant conduct during the late war with Great Britain. Those officers reached the city during the forenoon.—At four o'clock in the afternoon, a large number of persons consisting of the members of the Legislature, Executive and Judicial Departments, officers of the Army and Navy, visitors and citizens, assembled in the Senate Chamber.

There the Swords were presented, with suitable addresses by the Governor, and modest and becoming replies by the distinguished officers, who received them.

The Illinois Legislature adjourned on the 13th February, having been 75 days in session. They passed several bills of general importance. The State Bank bill, Canal bill, and the bill for extending the charter of the Shawneetown Bank, have passed. The capital of the State Bank is \$1,500,000, and the amount which is authorized to be borrowed for the commencement of the Canal, is \$500,000. The subject of *Common Schools* received no definitive action.

**SMALL NOTES.**—The law prohibiting the making and circulation, in New Jersey, of notes under five dollars, which for notes of one dollar takes effect on 4th July next, of two dollars on 1st January next, and of all others under five dollars, on 4th July, 1836, is enforced by a penalty of five dollars for each offence, as to any note of a State Bank, and of fifty dollars, as to any note of a bank out of the State.

**QUEBEC, FEB. 27.—Privilege of a Colonial Assembly.**—We have just heard that Mr. Speaker Papineau has issued his warrant for taking into the custody of the Sergeant-at-arms, HENRY JESSOR, Esq., Collector of His Majesty's Customs, on the ground of his refusing to obey a resolution calling for certain papers in his department, without either his having received the order of the Governor or that of any competent officer of the empire.

The Philadelphia Gazette of Saturday evening says:—"The river Schuylkill broke up on the night of the 5th inst. The ice is fast disappearing in the Delaware, and from present appearances, the navigation will be entirely open in a few days. The thermometer at 7 o'clock this morning, was at 33, and we have had this morning some hail and rain with wind from the northeast.

We learn from Capt. Robinson, that a line of steam packets has been established, by a company at Havre, to carry freight and passengers between that place and Hamburg, which leaves twice a week; their average passages are 54 hours. These vessels are 450 tons each, with double engines of 130 horse power, and 170 feet in length; they are very swift vessels, built in the strongest manner, of the best materials, and finished in a style of elegance equal to any vessels that float; in fact no expense has been spared by the company to make them very superior vessels. These packets afford a quick, regular and almost direct communication for passengers and freight between New York and Hamburg, both of which are taken at low rates; this intercourse was very much wanted, inasmuch as shippers of German merchandise had frequently to wait months for vessels, or transport the goods by land to Havre, at a heavy expense.

The company intends to have another line to run between Havre, Lisbon, Cadiz and Gibraltar, which will afford a direct communication between the south and the north of Europe.

There are on the stocks at Havre 5 large ships, 2 brigs, and 3 steamboats.—[Merc. Adv.]

**UNPARALLELED DESPATCH!**—Captain Shinn, of the packet schooner *Portsmouth*, politely handed us last evening the New York papers of the pre-

ceding day, (Tuesday) having accomplished the whole distance from wharf to wharf in (we believe) the unprecedented period of twenty-eight hours. The papers contain no foreign news.—[Norfolk Beacon.]

A physician, named Moniz, took up his residence in Norfolk, Virginia, when driven from Portugal during the political troubles some years ago. The change in affairs in that nation induced the Doctor to return; and he was soon elected a member of the Cortes—where he had scarcely taken his seat, before he offered a resolution to the Chamber of Deputies, expressing the grateful sense with which the conduct of the United States was regarded in relieving the inhabitants of the Cape de Verde.

An Advertisement in the Morning Chronicle offers a reward of three guineas for a set of gentleman's teeth, which were lost in an omnibus. Only think of going out to dine, and when the roast and boiled stand in all their glory before you, finding, confound it! that you have not got your teeth in your pocket!

**Six Acre Factory.**—The Bahrens of Manchester are erecting a huge power-loom mill at Preston in Lancashire, which will cover six acres of ground. The whole is to be one story high to avoid the inconvenience experienced in loftier buildings, from the machinery in the upper stories. It is to be called the "Six Acre Factory."

An elderly lady at a village in Norfolk, England, has adopted the singular idea that she is an old hen. Her restlessness and vexation were excessive so long as her friends contradicted the notion; but after a time they ceased to do so, and at the recommendation of her medical adviser, suffered her to think and act as she pleased. In consequence of this indulgence the good dame is more positive than ever of her feathered state, and has even gone as far as to make herself a nest in a clothes basket where she sits a great part of the day with most praiseworthy patience on three Dutch cheeses, asserting that they will be hatched in seven weeks time.—[Suffolk Chronicle.]

**ANIMAL INSTINCT.**—A seaman, belonging to the wood-party of a ship upon the coast of Africa, had straggled with his companions, and was using his axe freely in the woods, when a large lioness approached him, face to face. The man, for the first moments, gave himself up for lost; but very soon afterwards he began to perceive that the manner and expression of countenance of the lioness was mild, and even mournful, and that he had no danger to apprehend from her. She looked at him, and then behind her, and upward into the trees, and went a few steps from him upon the path by which she came; and then returned, and went again, and acted, in short, much as a dog would act that wished you to follow him. The seaman yielded to her obvious desire, and she led him some little distance, till, near the foot of a tall tree, she stopped, and looked up, with plaintive cries, into its branches. The seaman, directed by her eyes and gestures, looked upward also, and soon discovered, at a considerable height, an ape, dandling and playing with a cub lion, which he had carried thither for his amusement. The wants and wishes of the lioness were now easily understood. The lion species, though usually reckoned among the species of cat, differ absolutely from it in this, as in many other particulars, that it cannot ascend a tree; a distinction, by the way, which ought to satisfy us at once of the error of those who talk to us of lions in America, where in reality there is no lion, and where the puma and jaguar, which they call lions, so readily ascend a tree. But equally in vain would it have been for the sailor to climb after the cub; for the ape, at the best, would have enjoyed the frolic of leaping with his plaything from branch to branch, or from tree to tree, as he approached. The only chance, therefore, was to fell the tree before the ape, seated near its top, should have the sagacity to provide against the effect of the strokes of the axe at its bottom. To work, therefore, he went—the lioness, which had seen other trees fallen by the axe of the stranger, standing by, and impatiently waiting the event. The ape kept his seat till the tree fell, and then fell with it; and the lioness, the

moment the robber reached the ground, spring upon him with the swiftness and business of a cat springing upon a mouse, killed him, and then, taking her cub in her mouth, walked contentedly away from the benefactor to whose skill and friendly assistance she had made her sorrowful appeal! "I can so much the more readily," observed Mr. Gubbins, "believe that even wild animals should put faith in the skill and helping disposition of mankind, as I have myself met with a few striking examples of that faith and expectation in domesticated species, to whose observations, however, the human arts and powers must be more familiar. A short time since I was riding over a common, at some distance from my house, when a pig, which, in the course of feeding, had so twisted the triangular yoke upon his neck that the narrow portion of it pinched his throat and threatened him with suffocation—no sooner saw me, than he came as near as to the fore-feet of my horse, foaming at the mouth, and struggling to overcome his difficulty. That he believed in the power of a man to assist him was evident; but he had also his fears of that human power, as possibly more dangerous to his throat than all the pressure of his inverted yoke; so that whenever I alighted from my horse with the design of helping him he ran away, and yet, as soon as I was again seated, he returned, continuing to travel with me, close to the horse's fore-feet, or as near to my own person as he was able, his mouth still foaming, and his efforts to escape suffocation still prolonged. In the end, seeing a farm-house a little upon one side of my road, I pulled my bridle that way, the pig still accompanying me, till, reaching the yard-gate, I called to some of the people and appointed them of the pig's presence and misfortune, as my best means of promoting his relief.—[Barford Cottage, &c.]

**LATEST FROM PORTUGAL.**—The brig Opulence arrived last night, having sailed from Oporto on the 8th Feb.

Captain St. John brought no papers. We learn from him, that a steamboat arrived the day he left from Lis'bon, with Donna Maria and the Duc de Leuchtenburg, her husband; and that there was great rejoicing upon the occasion. The same steamboat brought the heart of Don Pedro in an urn! Captain St. John also informs, that it was reported the day he left, that France had declared war against the United States, which report caused a great deal of excitement.

Our accounts direct from France render the truth of the report impossible, as without any such information, it would be most extremely improbable.

**MECHANICS' MAGAZINE**, Nos. 1, 2, and 3 of Volume 5, for JANUARY, FEBRUARY, and MARCH, 1835.

These three numbers of volume 5 are now published and for sale at 35 Wall street, and at the principal bookstores. These numbers contain a great number and variety of articles, both useful and entertaining; and are printed in a style altogether superior to any of the preceding numbers of the work, and no efforts will be spared to render the work equal to any other of the kind published.

Bound or stitched volumes may be had single, or in complete sets, at the office No. 25 Wall street, of D. K. MINOR.

**AGENTS FOR NEW PUBLICATIONS.**

**HENRY G. WOODHULL**, of Wheatland, Monroe county, New York, is agent for the following Publications: The New York American Daily, at \$10.00—Tri-Weekly, at \$3.00—Semi-Weekly, at \$4.00 in advance.

The American Railroad Journal, Weekly, at \$3.00 per annum.

The Mechanics' Magazine, two volumes a year, at \$2.00 per annum.

The Quarterly Journal of Agriculture and Mechanics, at \$3.00 per annum, or \$1.25 per number.

The Family Magazine, 116 pages a year, at \$1.50 in advance.

The Monthly Repository and Library of Entertaining Knowledge, of 36 pages a month, at \$1.00 in advance, now in the 10th volume, bound volumes \$1.25.

The Ladies' Companion, of 54 pages a month, at \$2.00 per annum, in advance.

The Bookworm's Gem, at \$1.50 in advance.

All Communications addressed to me, at Wheatland Magazine, will be promptly attended to. September 29, 1834.

For terms, apply to **THOMAS J. ECKLEY**, Treas. &c., Boston, or to **ROBERT RALSTON**, Jr., Philadelphia. Boston, Dec. 20, 1834.

**RAILROAD CASTINGS.**

**MANY & WARD**, Proprietors of the Albany Eagle Air Furnace and Machine Shop, will make to order cast wheels, chairs and knees, and every other description of castings required for railroads. R-17 feb14

**NOTICE TO MANUFACTURERS.**

**SIMON FAIRMAN**, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh. August 12, 1833. A29 (17) RM&F

**PATENT RAILROAD, SHIP AND BOAT SPIKES.**

The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 2 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

**HENRY BURDEN**, Agent.

Troy, N. Y. July, 1831.

Spikes are kept for sale, at factory prices, by L. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. L. Brower, 223 Water street, New-York; A. M. Jones, Philadelphia; T. Janvier, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes.

**MILL DAM FOUNDRY FOR SALE.**

The Proprietors of the Mill Dam Foundry offer for sale or lease their well known establishment, situated one mile from Boston. The improvements consist of

No. 1. Boiler House, 50 feet by 30 feet, containing all the necessary machinery for making boilers for Locomotive and other steam Engines.

No. 2. Blacksmith's Shop, 50 feet by 30, fitted with cranes for heavy work.

No. 3. Locomotive House, 54 feet by 25, used for putting together Locomotive Engines. Several of the best Engines in use in the United States have been put in this establishment.

No. 4. A three story brick building, covered with slate, 130 feet by 45, containing two water-wheels, equal to 40 horse power; Machine Shop, filled with lathes, &c.; Pattern Shop; Rolling Mill and Furnaces, capable of rolling 4 tons of iron per diem, exclusive of other work; three Trip Hammers, one of which is very large; Engine for blowing Cupola Furnaces, moved by water-wheel; one very superior 14 horse Steam Engine, which could be dispensed with; and a variety of other machinery.

No. 5. An Iron Foundry, 80 feet by 45, with a superior air Furnace and two Cupolas, Core oven, Cranes, &c. fitted for the largest work. Attached to the Foundry is a large ware-house, containing Patterns for the Castings of Hydraulic Presses, Locomotive and other Steam Engines, Lead Mill Rolls, Gearing, Shafts, Spokes, Grates, &c. &c. These were made of the most durable materials, under the direction of a very scientific and practical Engineer, and are supposed to be of great value.

No. 6. A building, 65 feet by 30, containing a large stock of chimneys, and furnaces, for making Cast Steel. This building is at present used as a boarding-house, and can accommodate a large number of men.

No. 7. A range of buildings, 300 feet long by 26, containing counting room, several store rooms, a Brass Foundry, room for cleaning castings, a large loft for storing patterns, stable for two horses, &c. &c.

The above establishment being on tide water, presents greater advantages for some kinds of business than any other in the United States. Coal and Iron can be carried from vessels in the harbors of Boston, to the wharf in front of the Factory, at 25 to 30 cents per ton. Some of the largest jobs of Iron work have been completed at this establishment; among others, the great chain and lift pumps for freeing the Dry Dock at the Navy Yard Charleston.

The situation for Railroad work is excellent, being in the angle formed by the crossing of the Providence and Worcester Railroads. The Locomotive "Yankee," now running on the latter road, and the "Jonathan," purchased by the State of Pennsylvania, were built at these works. With the Patterns and Machinery now in the premises, 19 Locomotives and as many tenders, besides a great quantity of cars and wagons, could be made per annum.

For terms, apply to **THOMAS J. ECKLEY**, Treas. &c., Boston, or to **ROBERT RALSTON**, Jr., Philadelphia. Boston, Dec. 20, 1834.

**STEPHENSON.**

Builder of a superior style of Passenger Cars for Railroads.

No. 264 Elizabeth street, near Bleecker street, New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad now in operation. J28 14

**RAILROAD CAR WHEELS AND BOXES, AND OTHER RAILROAD CASTINGS.**

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to.

Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

**RAILWAY IRON.**

35 tons of 1	inch by 1	inch,	Flat Bars in lengths of
200 do. 1 1/2	do.	do.	14 to 16 feet, counter sunk
40 do. 1 1/2	do.	do.	holes, ends cut at an angle
800 do. 2	do.	do.	of 45 degrees, with splicing
800 do. 3 1/2	do.	do.	plates and nails to suit.

350 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, 5, and 6 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment. A. & G. RALSTON.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them. 471 Nassau

**SURVEYORS' INSTRUMENTS.**

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by

E. & G. W. BLUNT, 154 Water street, corner of Maiden lane. J21 61

**SURVEYING AND ENGINEERING INSTRUMENTS.**

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new, among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also a Railroad Goniometer, with two Telescopes—and a Leveling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG, Mathematical Instrument Maker, No. 9 Dock st., Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested. Baltimore, 1832.

In reply to the inquiries respecting the instruments manufactured by these, now in use on the Baltimore and Ohio Railroad, I cheerfully furnish the following information. The whole number of Levels now in possession of the department of construction of this make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of this kind are liable.

I have found that the patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

**JAMES F. STABLER**, Sup't of Construction of Baltimore and Ohio Railroad. Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

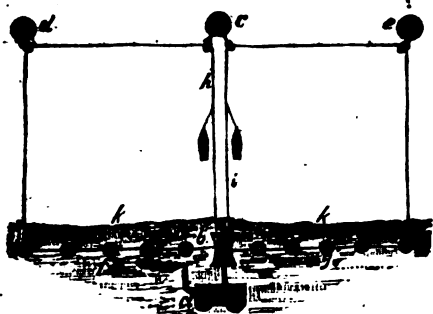

Germantown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

**HENRY B. CAMPBELL**, Eng. Philad. Germant. and Norrist. Railroads

al 17

[From the Journal of Commerce.]

**CATCHING SHAD BY STEAM.**—When Solomon said, many hundred years ago, "There is nothing new under the sun," he could not have foreseen that a portion of mankind so universally known as the "Yankees" would be continually inventing something "new under the sun," and bring the elements so completely in subjection to their will and pleasure as to change the order as well as the "eternal fitness of things." Man has been told that he should live by the "sweat of his brow;" but the "Yankees" by their ingenuity appear to be seeking out a way, if not to counteract this injunction, at least to make it as easy and pleasant as possible. They have earned a name by their enterprize, their daring, and their ingenuity, which, although some envious minded individuals may affect to cast odium upon it, has given them a character of which these same individuals are proud, and which is blended with that of the nation so strongly as to leaven the whole.

Among all the inventions that have ever been patented, the one I am about to mention not only caps the climax, but certainly is the last any one would have thought of projecting and putting in operation—IT IS CATCHING SHAD BY STEAM.

In the absence of a *drawing* and technical terms, I will endeavor to explain it as well as I am able, though I presume a more accurate description will be given when it is in operation, which will be very soon, in North Carolina—where catching shad is a very extensive business, employing for three or four months a great many negroes, &c. at considerable expense, as their nets are a mile in length. A steam engine (a) of small power is placed near the water's edge, with a concave wheel (b) attached to the shaft. Abreast of the engine, and at a suitable distance from the shore (k) for dropping the nets into the water, is a buoy (c) anchored, with two blocks fastened to it; at a distance to the right and left of the centre buoy are two more (d and e) with one block each. On the right and left of the engine are five more (f and g), making ten, with blocks also. From the concave wheel, two ropes (h i) run parallel with each other to the centre buoy, through the blocks, one passing to the buoy on the right, the other to the buoy on the left, from thence to the shore, and running through the blocks there, to the concave wheel connected with the engine. It will be seen that when the engine is put in motion, the ropes are in motion also. Two boats, having the net equally

divided between them, are fastened to the ropes running parallel with each other, and are carried out by them to the centre buoy, then to the right and left, and of course, as they separate, the net runs off from the boats into the water until they reach the other buoys. All that is necessary for the men in the boats to do next, is to take the ropes attached to the net for hauling it in to the shore, which is done by having the rope as it runs ashore take the boat with it in the same manner as they were carried out. When this is done, the rope running through the blocks on shore is cast from them, (being made so that it can be done,) and the ropes for hauling in the net take its place, and being attached to the engine, the shad are rapidly wending their way to the shore. The time occupied in taking out the net to the buoys, when placed in the boats and hauling it again to the shore, must be much less than it has been by physical strength heretofore. The plan certainly appears feasible; and if so, a great revolution will take place in this business. So great, that some other "Yankee" must invent some new method of separating the bones from the meat, so that it can be consumed as rapidly as the market is supplied; for I understand that the patentee calculates that the net will make its voyage in twenty minutes from the time it is put in motion on board the boats. So confident are those interested, (the patentee lives in this city,) that it will be fully tested next spring. K. N.

Hartford, Ct., Jan. 17, 1835.

**MECHANICAL POWERS.**—From a late foreign periodical we have gleaned the following interesting items, by which it will be seen that steam is not the only, and perhaps not the most economical power, that may be used for mechanical purposes. Much yet remains to be discovered in the arena of nature.

**New Moving Power.**—At a meeting of the French Academy of Sciences, on the 16th of June, a very interesting communication was read from M. Thilorier, a skilful chemist, who exhibited to the Academy the apparatus by which he procured a litre (a quart) of liquid carbonic acid in a few seconds. The properties of this substance, he observed, have been but little examined, chiefly because it requires to be confined in close vessels, hermetically sealed, and capable of resisting a great pressure. It surpasses all known bodies in the expansion and contraction which it undergoes from given variations of temperature; from 32 to 86° Fahrenheit, a column of the liquified gas is elongated one half. With the same change of temperature a similar column of air is only elongated one-eighth. This enormous dilation, M. Thilorier thinks, will, in future, afford the elements of a moving power infinitely more effective, as well as economical, than that which is derived from the expansion of vapor.

**New Mechanical Power.**—An ingenious mechanic at Brussels has just applied a new power to mechanics, from which great results appear to be expected. This

new power is galvanism. Across a fly-wheel, which is to give motion to the machine, he has placed a metallic bar, previously magnetised by a galvanic pile, and within the attraction of two very powerful magnets. The moment that the bar arrives in a rotary course at the limit of the attractive power, and when it would necessarily stand still, the inventor, by the application of galvanism, suddenly converts the attractive into a repulsive power, which continues the motion in the same direction, and by these alterations, well managed, the whole acquires a rapid rotation. The experiment is said to have been completely successful, and the machine worked a whole hour.

**HOOKS AND EYES.**—A young man in Boston, who recently returned from a whaling voyage, has constructed an uncommonly ingenious machine, in School street, for manufacturing hooks and eyes. It possesses advantages over any heretofore constructed, from this circumstance, that by altering a few screws, hooks or eyes may be made of different sizes. Those ordinarily in use can make but one size. After viewing this beautiful contrivance, which seems to possess consciousness, from the manner of its handling a skein of brass wire, we were at a loss which to admire most, the complicated apparatus effecting such surprizing labor, or the man who must have contrived the whole, and witnessed its unerring operations in an ideal form, before a single portion of it ever assumed a tangible shape.—[Scientific Tracts.]

#### PATENT HAMMERED SHIP, BOAT, AND RAILROAD SPIKES.

Railroad Spikes of every description required, made at the Albany Spike Factory.

Spikes made at the above Factory are recommended to the public as superior to any thing of the kind now in use. Ship and Boat Spikes made full size under the head, so as not to admit water.

Orders may be addressed to Messrs. ERASTUS CORNING & CO., Albany, or to THOMAS TURNER, at the Factory, Troy, N. Y. sept. 12-17

#### SUPERIOR GARDEN AND AGRICULTURAL SEEDS.

The Subscriber has now on hand a full supply of Garden and Field Seeds, growth of 1834; among which are all the finest cabbages, cauliflower, broccolis, radishes, peas, &c., that are cultivated in England, France, and Holland, together with every sort that can be raised to advantage in our own country, and which are grown expressly for my use from stock furnished and raised by the most experienced gardeners in this country; in short, every article emanating from my store I warrant genuine and fresh.

Also, skinless oats, potatoe oats, 44 lb. weight to the bushel, perennial rye grass, white clover, lucerne or French clover, orchard grass, Herd's grass, white mulberry, and yellow locust seeds, spring tares or vetches, genuine mangel wurtzel, and ruta bags, and field turnip, seeds well worth the attention of farmers.

Canary, Hemp, Rape and other bird seeds; wholesale dealers supplied on accommodating terms. Price lists by the pound and bushel furnished on application, as also catalogues of whole collection.

The flower seed department embraces the choicest variety to be found in this country, in which are included choice double double Dahlia seed, carnation and choice Pinks, German and China Asters, splendid double balsams, with an addition of several new varieties, accompanied with a printed direction for culture and management.

Orders will be punctually attended to and carefully packed and forwarded as directed, but as the collection of distant debts are often troublesome and sometimes impracticable, it is desired that satisfactory reference be made to persons in Albany, when the order is not accompanied with the money.

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, MARCH 31, 1835.

We continue in this number the general remarks of Mr. E. F. JOHNSON, which accompanied his Report relative to the Ontario and Hudson Canal. They show a mind well informed, and deeply impressed with the importance of immediate action upon all the great works of internal improvements, in order to secure the trade of the great West.

We regret not being able to give the remainder—which we are prevented from doing, as the copy has, by accident, been lost.

We would ask for the communication of "GOVERNEUR MORRIS" an attentive perusal.

The New-York and Erie Railroad bill finds greater opposition in the Assembly than was anticipated. It was indeed believed by its friends that there was some degree of liberality, or sense of justice, amongst those representatives of the people who have been so much benefitted by the State works. It is idle, however, to look for liberality there—or, at least, amongst many of them.

The following extract of a letter from Albany shows that some of the opponents of the measure are handled without mittens.

"In the debate in the Assembly on the bill to 'aid and expedite the construction of a Railroad from Lake Erie to the City of New-York,' Mr. WILKINSON, from Syracuse, (Onondaga), spoke at great length, and with much vituperation. His arguments were principally repetitions of a late publication in the Syracuse 'Standard,' going to show that no internal improvements ought to be made in the State of New-York other than along the line of the Erie Canal, and consequently through the village of Syracuse.

"He arraigned the motives of the honorable and patriotic citizens of New-York, who have become subscribers for the stock in the contemplated railroad, and imputed to them the fraudulent design of speculating in the stock without any intention to construct the road.

"He was answered by Mr. BURKE, of Cattaraugus, in one of the most overwhelming replies that I have ever heard. Mr. B. kept the whole house in almost breathless attention for about two hours. Mr. W., if he possesses a particle of sensibility, must have felt (as did all others) that he was annihilated. The constituents of Mr. BURKE owe him a large debt of gratitude, for his able assertion and defence of their rights, on the floor of the Assembly. Well may the people of Cattaraugus be proud of their representative!"

PENNSYLVANIA CANALS.—The Harrisburg Chronicle of 12th inst. says: "the Canal is filled with water, and navigation has commenced."

The Philadelphia Inquirer of Tuesday says: "the Delaware and Raritan Canal opened for business yesterday morning. The Schuylkill Navigation will open to-morrow. The weather, for the last day or two, has been delightful. Vessels arrive and depart without the slightest interruption."

Thus it will be seen that the PENNSYLVANIA CANALS are now, and have been since about the 10th inst., in full operation; by which they are not only enabled to anticipate us, by at least six weeks, on our canals; but also by nearly half that time on our "noble Hudson"—and yet our liberal friends on the line of the canal, are determined that our State and City shall not derive the benefit of increased or uninterrupted communication with the West, unless the new works pass directly by their own doors.

We cannot reflect upon the subject without being reminded of the inhabitants of a new country, who erect their dwellings to please themselves, and then insist that the main road shall pass *their door*; be it in a direct or indirect course, it matters not. So with some of our friends on the line of the canal—after they have had MILLIONS of public money spent amongst them, and have taxed the *salt*, and *calicoes*, and *teas*, and *sugars* consumed by other parts of the State, to open a communication with the Lakes, passing their doors; and thereby doubling the value of their property—they now say to other parts of the State, asking aid to open a communication to market, "If your work will pay an *interest*, you need no aid—if not, the State should not enter into unprofitable speculations."

Is this, we ask, the spirit and course of reasoning which is to retain for the State of New-York her proud pre-eminence for enterprise and public spirit?

The passenger cars on the Columbia Railroad are propelled by locomotive engines. The trip from Philadelphia to Columbia, 82 miles, is made in about six hours; and it is believed that it will soon be made in four hours.

STEAM NAVIGATION TO INDIA.—We find in the last number of the Edinburgh Quarterly Review, which has just come to hand, a long article on this subject, with copious extracts from the Report of a Select Committee of the House of Commons, to whom it was referred—affording much interesting information. We shall give it a place in the Journal at an early day.

Mr. Vignoles, Civil Engineer, has invented, as we learn from the London Mechanics' Magazine, an apparatus called spring connectors, for connecting trains of cars, by which the unpleasant concussions at stopping and starting the engine are diminished.

To the Editor of the Railroad Journal:

Have you, sir, seen the new LOCOMOTIVE ROTARY STEAM ENGINE of Wm. Avery, on the Newark Railroad, in operation? If you have not, I hope you will take an early opportunity of examining it, as I consider it one of the most ingenious yet simple machines I ever saw, and its operation is highly satisfactory to those who have seen its performance. Yours, very respectfully,

A MECHANIC.

In reply to the above question, we can say that we have not yet witnessed the operation of this engine on the railroad, although we saw one of them, many months since, in operation, in the machine shop of Elam Lynds, Esq. and William Avery, at Syracuse, Onondaga county, N. Y., which performed to admiration, carrying at the same time all the machinery of an extensive machine shop, blowing the bellows of a cupola furnace, and performing other work, with only an 18 inch arm, or 3 foot engine, and making the almost incredible number of over 3000 revolutions, as we were informed, in a minute. Several engines of the same description are, as we have been also informed, now in operation, and in all cases, so far as we know, to the entire satisfaction of those who use them.

We have been promised an early description and drawing of the engine for the Journal, which, when received, will be given to our readers without delay, when we hope the ingenious and enterprising inventor, and gentleman with whom he is associated, Mr. Lynds, will derive ample remuneration.

*Report of E. F. Johnson, Esq., in relation to a Ship and Steamboat Canal from Utica to Oswego.*

(Continued from page 147.)

#### General Remarks

I have thus far confined myself to an examination of the practicability and probable expense of that portion of the proposed steamboat canal, lying between Utica and Oswego.

I have thought it not improper, in continuation of the subject, to advert to some of the more prominent of the relations which a work of that magnitude, connecting the great lakes with the tide waters of the Atlantic, will bear to the internal commerce of the country.

That there is no other route presenting the same or equal facilities for an enlarged navigation, by which the trade of the west may be conveyed in the most direct manner to the sea-board, will, I believe, be readily conceded by every one acquainted with the physical geography of the country. The only important question, therefore, which remains to be decided, is, whether the time has arrived for forming such a communication. The evidence of this must be deduced principally from an examination of the existing and prospective increase in trade of that region of country, the surplus produce of which will naturally

find its way to market along the great thoroughfares from the Lakes to the Hudson.

The following table exhibits the past, with the prospective increase in population of the States and Territories mentioned, deduced from the census taken at the periods stated from 1800 to 1830.

States and Territories.	Area in square miles.	POPULATION.			
		1800.	1810.	1820.	1830.
New-York, . . . . .	46,000	586,050	959,049	1,372,812	1,918,532
Ohio, . . . . .	40,000	45,565	930,760	581,434	985,384
Indiana, . . . . .	37,000	5,641	24,590	147,179	345,081
Illinois, . . . . .	59,000	915	15,292	58,211	157,445
Missouri, . . . . .	61,000	19,832	66,586	140,455	265,589
Michigan Territory, (proper), . . . . .	36,000	8,896			
Wisconsin, (fertile portion), . . . . .	95,000				
Missouri T., " . . . . .	227,000				

If the estimated increase, as exhibited in the table, is not overrated, the population of all the States and Territories mentioned will be doubled in about fifteen years.

The population of a country has not unfrequently been assumed as a proper measure of the extent of its trade, or of its ability to furnish a surplus produce to exchange for the commodities of other regions.

This principle is correct when applied to countries having equal natural resources, possessing equal facilities of soil and climate, and in which the total amount of productive power is fully and profitably employed.

That much depends upon the full and profitable employment of the productive power, is strikingly exemplified in an estimate recently made of the comparative amount of animate and inanimate force applied respectively in Great Britain and France to agriculture, commerce, and the arts. From this comparison it appears that France, with a population nearly dou-

ble that of Great Britain, and a climate and soil in no respect inferior, has a productive power, in agriculture, but little greater, and in commerce and the arts, two thirds less than Great Britain. Great as this difference is, it would undoubtedly be exceeded if the comparison were made between Great Britain and some of the other civilized nations of Europe.

With respect to the extent of country, the trade of which is to be conducted upon the New-York canals, but a small portion of it has reached that point where it can boast of more than its agricultural power, and even this is in no respect fully developed.

The surplus productions of a country, in the early stage of its settlement, bear a less proportion to the amount of its population than when more advanced. The reason is obvious. The first settlers are mainly occupied in procuring for themselves and families the means of subsistence; in clearing ground for cultivation; in erecting suitable dwellings, and in opening the necessary roads.

They have, consequently, but little remaining to offer in exchange for the productions of other regions. It is not, moreover, until a country has been some time settled, that the extent of its mineral resources, and the fitness of its soil and climate for the perfection of various productions, can be fully ascertained.

It is only, likewise, in a country somewhat advanced, where the business and occupations of individuals are established on a permanent basis, that the greatest benefit are derived from an economical division of labor, and its surplus or exchangeable wealth increased to its greatest amount. The accession, likewise, to its wealth, from those mutual exchanges, through the aid of which each separate territory is enabled to produce those commodities, and those alone, in which it is peculiarly fitted to excel, can never be fully realized until the avenues of exchange are opened, and the wants and capabilities of each fully understood.

The influence of these several causes upon the amount of trade, is particularly exemplified in the progressive increase of the business upon the New-York canals, since the period of their completion.

In the very able report of the Canal Commissioners, made to the Legislature of this State in 1825, there is an estimate of the probable increase in revenue upon the Erie Canal for the succeeding ten years, based upon, and corresponding with, the assumed increase in population for the same period. This estimate gives for the population, whose surplus produce is conveyed upon the canal in 1834, \$1,800,000, and for the whole revenue for the same year, \$900,000.

How much the assumed differs from the actual increase in population, it is impossible to say; but enough may be inferred from the table above given, to lead to the conclusion that the actual increase has been less than was anticipated, while the receipts from tolls, instead of \$900,000, have been increased to 12 or \$1,300,000, the much larger portion of which has been drawn from the interior of New-York, comprising but a moiety of the population intended to be included in the estimate.\* This, too, notwithstanding there have been two successive reductions in the rate of toll, amounting to nearly 40 per cent.; the

\* The tolls collected at Buffalo, in 1833, amounted to little more than one twentieth of the whole revenue of the canal, and in 1832, to one sevenieth.

country having, in the mean time, suffered much embarrassment in its commercial relations, from the visitations of Providence, and other causes. All which goes conclusively to support the principle I have endeavored to illustrate, viz.: that in a growing country advance in wealth must necessarily exceed that in population.

From the table above given it appears that the population of the country, west, may be safely calculated to double its numbers during the next fifteen years. This country is now, to a considerable extent, in the condition I have already described, but partially advanced from a state of nature: fertile in soil, and fruitful in its latent resources, waiting only the hand of labor and of art for their speedy and easy development.

In this region, a lapse of time of fifteen years, when considered in connection with the characteristic enterprise of its people, and the fact of their having but just entered upon the great business of trade, must exhibit changes and improvements which we can now scarcely appreciate, and the increase in exchangeable wealth, instead of being doubled in the ratio of the population, will more probably be trebled.

If we look forward but the half of a century, we shall perceive that the population, at the same rate of increase, will amount to fifty millions, and will then only equal in density that of Massachusetts and Connecticut at the present time. Whether this ratio of increase will continue, cannot be affirmed: but this we do know, that so long as the purity and simplicity of our government shall be preserved, and the rights of conscience and privilege to pursue legitimate private interest are held sacred; in fine, so long as our country shall continue to maintain the pre-eminent position which it now occupies in the great scale of nations, so long will it continue to increase in population and wealth, and in no part of it will this increase be more rapid, or in the end attain a higher maximum, than in the rich vallies of the St. Lawrence and Upper Mississippi.

To those acquainted with the navigation of the Erie Canal, it will be evident that any material increase in its business could not, in its present state, be accommodated.

The plan of doubling the locks will add to its capacity, but even this improvement will not, it is feared, ten years hence, prove adequate to the demands of trade; and to realize the utmost advantages from it, should be attended with an enlargement of its channel, otherwise much will be lost which might be saved in the force of traction; and what is of still greater moment, the flow of the water upon the longer levels may be found, in extreme cases, insufficient without such enlargement, for the purpose of lockage.

Could the business upon the canal be equalized, the boats freighted uniformly to their maximum tonnage, and their periods of arrival and departure likewise rendered uniform and regular for the whole navigable season, the capacity of the canal in both its present and improved state, would be more than doubled; but such an arrangement can scarcely be effected consistent with the convenience and interest of the community.

The fluctuations of trade, which are ever ceaseless and often great, occasioned by the alternations of seed time and harvest, and the changing character of the seasons, combined with other causes of a political nature, will not admit of subjection to a Procrustean system, without a sa-

crifice on the part of community, which it will be their aim to avoid, by seeking other channels for the transmission of their produce.

The evils arising from restrictions upon commerce, whether natural or artificial, and however transient, are always attended with serious consequences. The country has but recently witnessed the injurious effects of a similar interference in the accustomed flow of its currency; and a like restriction upon trade, in the transfer of the productions of the soil and the various necessities of life, would be attended with consequences still more prejudicial.

The necessity of an improved communication is becoming daily more apparent, not only from the growing commerce of the country, but from the efforts which are making in other sections, to divert the trade of the west into other channels.

On the south, the States of Pennsylvania, Maryland, and Virginia, are each strenuously engaged in overcoming the barrier of the Alleghanies, while on the north, a channel for large vessels has been opened by our Canadian neighbors from Lake Erie to Lake Ontario, and the only remaining obstructions to a descending navigation along the St. Lawrence, to tide water in that direction, are now being overcome by a canal constructed on the same magnificent scale with the one around the Falls of the Ohio.

The competition by which the State of New-York is thus threatened, and which she will soon be compelled to encounter, is truly formidable, and should be met by an increased effort and determination, not only to secure, but to add to the ascendancy which she already possesses over the commerce of the country.

That the proposed steamboat canal from the Hudson to Lake Ontario, is eminently calculated to aid in promoting this object, does not, I conceive, admit of a doubt. This it will accomplish, by its effect, in expediting and in cheapening transportation.

From Lake Erie to the Hudson River, the distance by the Ontario route is 378 miles, and exceeds that by the Erie Canal only 15 miles. Of this distance, 146 miles is along the Niagara River and through Lake Ontario; about 62 miles more of improved navigation along the Oswego and Oneida Rivers and Oneida Lake, leaving only 140 miles from the latter point to the Hudson at Albany.

The increase in lockage by the Ontario route is 240 feet, which being overcome by 30 locks, will occasion a delay of four hours; making the liberal allowance of eight minutes for the passage of a single lock. To compensate for this delay, we have the greater celerity of motion on the Ontario route, which may be rated as follows:

Buffalo to Lewiston,	36 miles,	3-13 miles per hour,	9 hours.
Lewiston to Oswego,	146 "	9 "	16 "
Oswego to Albany,	202 "	5-12 "	37 "
Total,	378 miles in		62 hours.

By the Erie Canal the distance is 363 miles, which, at 24 miles per hour, the average speed for freight boats, gives 145 hours; making a difference in favor of the Ontario route of 83 hours, or reducing the time more than one half.

This is, probably, a greater difference than would be proper to assume, if the comparison were made between the canal and vessels propelled solely by wind upon the lake. But if the average is taken of sail vessels and steamboats upon the lake, with steam upon the canal, I believe the truth will not be exceeded by placing the ratio of time at one half, or at most two-thirds,

which the Ontario and Hudson will bear to the Erie route. This saving in time, although produced mainly by the superiority of lake navigation, combined with the use of steam, is due in part to the fact that the continued interruption to their progress, to which boats on the canal are subject in passing each other, is in a great measure avoided, and likewise to the diminished resistance to which boats are subject, when moving in a larger channel: an advantage, which, if it does not contribute to the speed, will be gained in power.

My estimate of the probable relative cost of transportation, is deduced, in part, from a printed tariff of rates established by companies engaged in that business, for the year 1834, and since the reduction of the tolls.

From this tariff, the charge per mile, per 1,000 lbs., for heavy goods, conveyed as described, is as follows:

	Miles.	
New York to Albany,	7.3	Steam on the Hudson River.
Albany to Buffalo,	22.6	By the Erie Canal.
Buffalo to Detroit,	11.3	By vessels.
Buffalo to Chicago,	18.7	By steamboats.
Oswego to Niagara,	6.2	By schooners to 20th Sept.
Oswego to Toronto,	14.5	To 15th October.
	13.2	

The preceding exhibits a great difference in favor of navigation by wind and steam upon the larger waters, when compared with a canal.

On the Hudson River the cost is only one third of that upon the canal for the same distance.

On Lake Erie, from Buffalo to Detroit, it is one half by sail vessels and three fourths by steamboats. On Lake Ontario it is two thirds, and from Buffalo to Chicago but little more than one fourth.

The reason for a higher charge upon Lake Ontario than Lake Erie, is undoubtedly in a great measure owing to the less amount of business upon the former, a difference which will not exist when Lake Ontario shall become a more general medium of transportation.

From Lake Erie to the Hudson River, on the Ontario route, one third of the whole distance is lake navigation. It will not, I apprehend, be unreasonable to infer from the facts presented above, that the cost of transportation will, in consequence, be materially reduced.

A very important saving may likewise be anticipated from the greater celerity of motion by which the same amount of fixed capital invested in vessels, &c., will yield a greater annual profit. This is inferred from the fact that age, and not severity of usage, is the principal cause of the decay of vessels.

We may calculate likewise upon a farther reduction, by the time and expense saved in the transfer of freight. On the proposed route through Lake Ontario, with an enlarged steam navigation to the Hudson, there will be no breaking of bulk from the shores of Lake Michigan or Lake Erie to New-York. That this is not an item of inconsiderable importance, will appear, when we reflect that in the process of loading and unloading, much time is consumed, vessels are lying idle, merchandize liable to be injured, and warehouse expenses incurred. It is in consequence of this, that the transportation per 1000 lbs. per mile, from Buffalo to Chicago, is but half of that from the same place to Detroit; the distance in the former case being quadruple that in the latter. It is likewise from this principle, that the rate of transportation at which the foreign commerce of the country, is conducted upon the high seas, is still less than the preceding, although the

charges for insurance are, in general, much the greater in the latter case. In accounting for this difference in expense, it should in part be considered that large vessels are navigated with a less number of men, and, in general, cost less in proportion to their tonnage, than those of smaller dimensions.

An important saving in expense, is likewise anticipated by the use of steam as an impelling power. The experiments which have hitherto been made for navigating the smaller canals by steam, have invariably failed. It would seem, therefore, that if this great and growing power in the arts, can be applied at all, to artificial navigation, it must be on canals of a large size. That it can be so applied, on the portion of the proposed canal from Utica to Oswego, I do not entertain a doubt.

The most economical mode of applying this power, is undoubtedly that of towing, by which one or more vessels are propelled by a single steamer, in the manner at present practised in the navigation of the Hudson. Where there is much lockage to be overcome, this method, from the delay attending the passage of the locks by a train of boats, cannot so conveniently be adopted.

[For the American Railroad Journal.]

*New-York.—Her Internal Improvements, present and prospective.*

The State of New-York, in her system of internal improvements, is approaching a new era. Her main avenue of communication with the West, the Erie Canal, if not already, will soon be inadequate to the demands of trade. This canal has been in successful operation scarcely ten years, and in that time the business upon it has almost quadrupled in amount—and, what is most remarkable, has been principally derived from within the limits of the State. With the experience of the past to guide us, we can form some idea of the future. For the next ten years, it will not be improper, we imagine, to anticipate a similar and even greater increase; more especially when it is considered that, in addition to the trade within the limits of the State, we may anticipate a very great accession from the States and Territories West, which are now just beginning to furnish a surplus produce, to be exchanged for the manufactures and productions of the East.

The great problem now to be solved is this: What further means must be devised for the cheap transmission and full accommodation of this great and growing trade.

Since the construction of the Erie Canal, a rival method of intercommunication has been introduced, which bids fair to take the precedence of canals in most situations. We allude now to railroads. Their peculiar advantages are obvious—greater economy in construction—very great saving in power under high velocities—available at all seasons—adapted alike to passengers and freight, and possessing superior advantages in the conveyance of the mails, and the various purposes for which a cheap and rapid communication is required.

Under this view of the subject, it becomes a matter of deep interest, requiring careful and profound investigation to deter-

mine which method should be allowed the preference.

Already two lines of communication are projected, to extend from the Hudson to Lake Erie: one through the central, and the other through the southern part of the State. A navigation on an enlarged scale has likewise been projected, suited to vessels navigating the larger waters, and designed to unite Lakes Erie and Ontario, and to connect the latter with the Hudson.

A plan has likewise been proposed by the Canal Commissioners for enlarging the Erie Canal, retaining the present size of the locks, with the exception of a trifling addition to their length, and doubling their number. This improvement, if the canal is made  $7\frac{1}{2}$  feet deep and 70 feet surface, will cost the State 6,000,000 dollars. The same amount of money will form a communication of much larger dimensions, by the way of Lake Ontario. This is owing to the fact, that on the latter route, one half the total distance, nearly, is natural navigation.

It is from this circumstance, likewise, that we anticipate with certainty that the cost of transportation will be less, the present rates on the Hudson and the Lakes being from one third to two thirds less than on the canal: such is the superiority of natural water, aided by steam, over artificial. The delay and cost of transshipment will be saved. These points of superiority of the Ontario route are of the utmost importance in securing the "far West" trade; a large portion of which is in danger, from foreign and domestic rivalry, of being diverted to the more northern and southern markets.

The importance of the Ontario route is likewise greatly enhanced from the anticipated connection between Lakes Hudson and Ontario, which is about being accomplished by the Canadians, and which will shorten the navigable distance from the Hudson to Lake Michigan, and the whole country north and west of Detroit, nearly 250 miles.\* Considering the vast amount of trade which, fifty years hence, will be required to pass to and from the seaboard and St. Lawrence and Mississippi valleys, it is evident that a navigation on the largest scale possible should be formed.

On no other route can a canal of as large dimensions be constructed, as between the Hudson and Lake Ontario; and on no other can the transportation be conducted at so low a rate.

We have stated our convictions that railroads will supersede canals in most situations; but, whether railroads are successful or not, it appears to us that a navigation on an enlarged scale will be required between the Hudson and the great Lakes.

The extent of natural bears so large a proportion to artificial water, as to require that the chain of navigation be perfected and unbroken throughout the whole distance inland from the Hudson to the Mississippi.

The Erie Canal has thus far drawn most of its business from within the limits of the State. As the general course of trade is to and from the interior and the seaboard, that portion of the canal nearest the latter point has been the most crowded; the business upon it from Lake Erie is increasing towards the Hudson almost in an unlimited ratio; so that, although it has, as a whole, been supplied with business almost

\* See Report of E. F. Johnson, Esq., Doc. No. 195, Assembly.

to the extent of its capacity, the western portion of it is susceptible of a still farther increase, and will not need relief for some time to come.

Under this general view of the subject, it does appear to us that the great interests of the State and the country West will be best subserved by directing the attention and the energies of the State to the opening of a navigation on the largest scale from the Hudson to Lake Ontario, and from the latter to Lake Erie.

When this is completed, a continuous line of railroad will probably be in operation from Albany to Buffalo, and we shall know by actual experiment whether any enlargement of the western part of the Erie Canal will be needed,—which we will venture to assert will not be the case.

By pursuing this course, we shall make sure of the very best navigable communication between the Hudson and the fertile regions of the West; and we shall avoid likewise the great hazard of sacrificing the large amount of money required for the enlargement of the western portion of the Erie Canal, which would be entirely lost in case the expectations as it regards railroads are realized.

The State has thus far acted, in forming its plans for future improvement, without sufficient reflection and investigation.

The project of doubling the locks was hastily planned; but, without enlarging the canal, it has been found an useless measure, and suspended. The present project of enlarging the channel of the canal, in connection with the doubling of the locks, must likewise be abandoned. First, because of the great disparity between the breadth of the canal and that of the locks and boats; and secondly, because it fails to remedy an important defect in the present size of the locks, from their not being large enough for steamboats and vessels navigating the larger waters. It must be abandoned, likewise, because, under the present state of things, no plan for a general system of intercommunication can be judiciously formed, without some regard being paid to the effects and advantages of railroads, and because the Ontario route, the one which will be found the cheaper and preferable of the two, is not embraced or considered in the proposed improvement.

Surely this hasty and inconsiderate mode of legislation does not comport with the dignity of a great and growing State like New-York.

The experience of the few past years, combined with that enlightened forecast which should pervade all the more important acts of the State, should be brought to bear upon this most momentous question.

We have arrived at that point where either a complete revision, or the carving out of an entire new system of intercommunication, is imperiously demanded; and the subject should be approached and examined in the most serious and thorough manner, and with a spirit of liberality and forecast worthy of the State, and of the great objects to be attained.

GOVERNEUR MORRIS.

[From the New-York American.]

The cause of Internal Improvement in this State seems to be retarded in some most insidious way; or, if advanced at all, only in the line where already so much has been done—that in and about the Erie Canal. Now, it is the farthest thing in the world from our wish, to object to any reasonable proposition for rendering this

canal still more useful, and tributary to the advantage of the State; for it has proved itself entitled to every additional aid that can be beneficially applied, and we hold up both hands for granting it. But when this feeling of entire confidence and liberality is both felt and expressed towards that great work, is it not fair to anticipate, that something of a corresponding feeling should be evinced by those on the line of the canal, towards other great works under contemplation, or in progress? We refer not now to any one particular project, but to several, which are before the Legislature, and all of which, more or less, seem to meet with an unaccountable—though frequently covert, and therefore more mischievous—opposition, from those who claim to be the friends of the Erie Canal. This is not either politic or just. There is room, and scope, and employment, enough for all; and when a reasonable probability is exhibited, by the investment of capital on the part of private individuals, that any contemplated work may prove beneficial, this State—which has so liberally ventured heretofore, and so largely profited by its liberality—should not hold back.

Our wealth, enterprise, industry, fertility of soil, and the possession of a seaport which, like the city of New York, commands the commerce of the world, all combine to render it obligatory on those who rule the State, to foresee, and provide in advance, for the new outlets and intercommunications required by our rapid growth. Let not a niggard calculation—which in the end is any thing rather than economy—and still less, a spirit of party, which fears to hazard out of its own hands, the application of the public wealth to the cause of general improvement—let no such calculation retard our onward march. Arrest it they cannot, for it will still be onward.—But it may be impeded, troubled, and eventually less assured, than, with the generous aid of the funds of the State, it would otherwise be.

Again, therefore, we press it upon the Legislature, to look with a large and liberal view at the cause of internal improvement, and wherever reasonable probability exists, that the good to be accomplished exceeds the hazard of loss, to go forward boldly.

New-York must look to it, or her communication with the Great West—through her own roads and canals—will fall off. The current of trade now sets in our favor, and if we provide, as we should, new channels as they are needed, it cannot be diverted. If not, it will be.

The Baltimore American—in announcing the final passage of the *Internal Improvement Bill* by the State of Maryland—a bill which gives millions to the *Baltimore & Ohio Railroad*, and to the *Chesapeake & Ohio Canal*—thus breaks forth in rejoicing:

Thus has passed the bill which makes the name of "Marylander" one which may be proudly boasted of. Thus has the State, with a single stride, assumed the highest rank among her sisters; and as, in olden times, the first Magistrate of Venice performed the nuptial ceremony with the sea, which was the source of the wealth of her Republic, so has Maryland now wedded herself to that mighty West, which teems with the elements of her future and ever increasing prosperity."

A daily line of Steam Packets between Pittsburgh and Louisville, went into operation, as we learn from the *Pittsburg Gazette*, on Monday last.

**OPENING OF THE CANALS.**—We are authorized to say that directions will be given for placing all the canals of the State in a condition to be navigable on the 15th of April next.—[Albany Argue.]

**TUBULAR BOILERS.**—The ferry boat Essex, built for the Cortland-street and Jersey City Ferry, is furnished with two of Dr. Nott's tubular boilers—constructed for burning anthracite coal.

These boilers, a part of which consists of a large number of small malleable iron tubes, of about 1½ inch diameter, and three feet in length, placed perpendicularly, are seven feet in length, and three and a half feet in width, by seven feet high. The supply of water, entering at one end, near the bottom, is forced up through the small tubes, between which the heat passes towards the chimney.

The furnace, or place for the fire, is at the side of, extending its whole length, and on a level with, the tubular part of the boiler, about two and a half feet in width, by four in height, the flame, or heat, passing in a horizontal direction, between the tubes of the boiler, and thence into the chimney, or smoke-pipe, which is placed on the side of the boiler, opposite to the fire.

The fuel used on Monday last, when a short excursion was made up the Hudson, was entirely of *Lackawana coal*, used mostly in large lumps, resting on a series of moveable grates, similar to those used in Dr. Nott's stoves. When the boat left the foot of Cortland-street, many of the lumps of coal were but partially ignited: the wind being aft, and the chimneys very low, calculated only for crossing the river, as a *Ferry Boat*, the full effect of the fire was not felt until the boat was put about, to return to the city, although she made *twenty-three revolutions* to the minute. It was perceived, however, on going against the wind, that the fire had become a perfect mass of glowing heat—at which one could not look, on opening the furnace door, without much the same sensation as when looking at the brightest meridian sun. The interior of the furnace, which is lined with fire-brick, is about six feet in length, by 2½ in width, and four in height. It is difficult for any one who did not witness the trial, to be convinced of its entire success. We have heard much said of the beauty of anthracite coal fires, especially of the Schuylkill, or *Peach Orchard* coal; and we have seen specimens which were all that could be desired; yet we have never seen any thing equal to that made of *Lackawana coal*, on board of the *Ferry Boat Essex*.

There were some gentlemen on board, several experienced machinists; and it was conceded by all, that the experiment was eminently successful—and that it is no longer a question as to the entire feasibility of the use of *Lackawana coal* for steam navigation.

Great credit is due to Dr. Nott for the perseverance with which he has pursued so important an object, and the success with which his efforts have been attended. The public are much indebted to him also for

the construction of a boiler which is safe, almost beyond possibility of accident—as if one of the tubes should burst, no danger could occur, as it is inclosed in an iron case, and the water would rather serve to extinguish the fire.

In case of accident, the fire may be wholly turned from the tubes, or boiler, and the cold air made to pass through them, so as to cool them more rapidly.

The engine and machinery were constructed at the Novelty Works in this city, by Mr. T. B. Stillman, and do him much credit. We are promised a drawing and more full description, which we hope to give in a subsequent number.

We have received the following letter from a friend at Albany; and by way of eliciting the information he desires, which we have not by us, we publish his letter entire; and request gentlemen possessing it to furnish us with the statements desired.

To the Editor of the Railroad Journal:

Dear Sir,—I take the liberty of making the inquiry whether you have in your possession, or at command, the reports of any railway in England for their last year's transportation and dividends; what I wish access to is official statements. As also the same information in relation to any of the railroads in this country; either of their actual cost completed, or their expense-account the last or preceding year.

I shall examine your Journal, but there appears to be a difficulty in getting a statement of the actual cost of works, and the account of a year's business from their books, so that a comparison may be made.

I should be pleased to obtain information as to the cost of the Camden and Amboy railroad, as also the Paterson, the Columbia, the Baltimore and Ohio, or either of them.

I inclose you a year's subscription, \$3, for the Journal.

If you can give me, or refer me to, any information, as stated above, I shall esteem it a particular favor. Sincerely yours,

The whole stock of the Wilmington and Susquehanna railroad, — \$400,000, — was promptly subscribed last week. The portion of stock allotted to Wilmington was taken in half an hour, and the Philadelphia Inquirer states that when the hour arrived for the opening of the books in the latter city, the persons who were in waiting to make subscriptions were informed that all the stock had been already taken. It sold, a few hours after, at four dollars advance per share.

The Railroad in question is designed to connect Wilmington with Simper's Point, at the head of the North East river (a branch of the Susquehanna) — five miles from Havre-de-grace. The length of the road will be twenty-five and a half miles.—[Baltimore American.]

**LIVERPOOL AND MANCHESTER RAILWAY.**—The annual general meeting of this Company was held on the 22d January, Charles Lawrence, Esq., in the chair. The report of the proceedings of the last half year, ending December 31, 1834, was read by the Secretary, Mr. Henry Booth, which gave general satisfaction. A dividend of 4l. 10s. per share was declared, payable on the 3d of next month.

[From the Journal of the Franklin Institute.]

*Report to the Board of Directors of Bridges, Public Roads, and Mines, upon the Use of Heated Air in the Iron Works of Scotland and England.* By M. DUFRENOY, Engineer of Mines. Paris, 1834.

Some experiments by Mr. Neilson, Director of the Glasgow Cast Works, led him to think that advantage would be gained by previously heating the air to supply the smelting furnace. He communicated his ideas to Mr. Mackintosh, long known for his inventive genius, and they united in undertaking at the Clyde Iron Works, in concert with Mr. Wilson, one of the proprietors of the establishment, a series of experiments to determine this important question.

In the first experiment, the air from the blowing machine was passed through a rectangular trunk of sheet iron, ten feet long, four feet high, and three feet wide, where it was heated previous to its entrance into the furnace.

Notwithstanding the imperfection of this method, by which the temperature of the air could not be raised above 200° Fahr., it was evident from the experiment that the plan of Mr. Neilson was destined to produce a revolution in the manufacture of iron.

This first apparatus was soon destroyed by the action of the heat, and its renewal being very costly, they substituted a cast iron pipe, having in the middle an enlargement like the bulb of a thermometer.

This second apparatus produced beneficial effects; it lasted much longer, and the temperature of the air was raised by it to 280° Fahr. This increase, though small, produced a visible economy in fuel. Messrs. Neilson, Mackintosh, and Wilson, then understood the advantages which would result from raising the temperature many hundred degrees. They abandoned this heating tube, and constructed a new apparatus, presenting a great number of tubes, heated in many points of their length. By this means, the temperature of the air was raised to 612° Fahr., a temperature above that of melted lead.

Though this temperature was much below that required for smelting iron, (estimated at about 1500°) it produced a considerable saving in the consumption of fuel. Another advantage was obtained of great importance—that of being enabled to substitute crude coal for coke, without injury to the walling of the furnace. The quality of the iron was, on the contrary, improved, and the furnace, which produced but little more than half its quantity of No. 1 and half of No. 2, when fed with coke, gave a proportion much greater of No. 1 iron, after the substitution of crude coal. Besides, the consumption of fuel was considerably diminished. This last circumstance was owing, probably, to the fact, that the temperature of the furnace becoming higher, it was not necessary to add so great a quantity of flux to insure the vitrification of the gangue which accompanied the mineral. It is probably owing to this

elevation of temperature that coal may be substituted for coke.

The better to judge of the progressive increase of economy obtained at the Clyde Works, in the experiments to be noticed, we give for each of them the different consumptions of coal and flux.

In 1829. The combustion being maintained by cold air—

Coal.	1. For fusion, three tons coke, corresponding to	Tons. cwt. qrs.
	2. For the blast engine . . . .	6 13 0
		1 0 0
		7 13 0
Flux . . . . .		10 2

In 1831. The furnace being in blast with air heated to 450° Fahr., they still burnt coke for the fusion of the metal—

Coal.	1. For fusion, 1 ton 18 cwt., corresponding to	Tons. cwt. qrs.
	2. For the heating apparatus . . . .	4 6 0
	3. For the blast engine . . . .	0 5 0
		0 7 0
		4 18 0
Flux . . . . .		9 0

In 1833, July. The temperature of the air was raised to 612° Fahr., and crude coal used for fusion—

Coal.	1. For fusion . . . .	Tons. cwt. qrs.
	2. For the heating apparatus . . . .	2 0 0
	3. For the blast engine . . . .	0 8 0
		0 10 0
		2 18 0
Flux . . . . .		7 0

At this last epoch, the employment of heated air had augmented the yield of the furnace more than one-third, and consequently had effected a great saving in labor. In fine, the quantity of air required to maintain combustion in the furnace was also found to be sensibly diminished. The blast engine of seventy horse power, which was sufficient in 1829 for only three furnaces, was found of ample power for the blast of four.

By comparing the results which will be indicated, it will be perceived that the economy in combustion is in proportion to the increase of temperature. As to the absolute saving, it varies in each furnace according to the nature of the coal, and the care used in carrying on the operation.

In spite of the complete success of these experiments, the introduction of heated air into the iron works encountered great difficulties. It was necessary to conquer not only the power of habit, but the prejudice generally existing, that the coal is sulphureous, and that its transformation into coke is not only favorable to combustion in the smelting furnace, but that it is indispensable to the making of iron of good quality.

This plan, in use four years in the environs of Glasgow, which it has saved from certain ruin, has scarcely passed the frontiers of Scotland. However, the wonderful advantages which it has pro-

duced, have begun to triumph over these prejudices, and gradually to extend its use in the different provinces of England. I know of twenty-one works containing sixty-seven furnaces, which work with hot air. In Scotland, six; Flintshire, one; Derbyshire, three; Newcastle-on-Tyne, two; Newcastle-under-Line, two; Staffordshire, five; Pontepool, two. Total, twenty-one.

The iron made at these furnaces is generally No. 1, proper for casting the nicest work.

The plan is equally applicable to the metal intended for bar iron. To obtain this quality of metal it is only necessary to change the proportion of fuel and mineral. The forges upon the Tyne Iron Works, near Newcastle—of Codnor Park, near Derby—employ for the manufacture of bar iron, none but the pig metal produced in the hot air furnaces.

In most of the establishments cited, the crude coal has been substituted in place of coke. In some works, where this substitution has not yet been adopted, they assured me, as at Monkland Iron Works, near Glasgow, that the temperature of the air was not raised sufficiently to enable them to pass from the manufacture by coke. In some others, the quality of the coal, being extremely bituminous, as near Newcastle, appeared to be an obstacle to the use of coal in the natural state.

The employment of hot air is not yet introduced into the great works at Merthyr Tydvil, Wales. The small consumption of coal which is employed crude, as I shall indicate at the close of this report, and the high price of the patent, has retarded its adoption; but I have no doubt that this plan will produce in this country a sensible saving in the consumption of fuel.

To appreciate the advantage which results from the employment of hot air, I shall give a statistical view of the works visited. I will describe the apparatus as far as they differ from each other; and I will compare the consumptions and expenses incident to the production of a ton of iron, before the introduction of hot air, and at present. This description will no doubt appear tedious, but in so important a question, and one which may have immense influence upon our forges, I think nothing should be omitted tending to instruct our iron masters. I will then give some details upon the coals used in these works, and upon the expenses of manufacture in the Welsh works.

Finally, I will terminate the report by a recapitulation of the principal experiments which have been made in France to introduce the use of hot air in the iron works.

Before commencing this description, I should pay a just tribute of acknowledgment to the proprietors of the works which I have visited. Almost all have procured me, with a noble generosity, the means of studying their establishments with advantage. They have shown, in this circumstance, that the sole rivalry which exists between France and England is that of emulation.

*To be continued.]*

[From the Genesee Farmer.]

ON DRAUGHT. No. II.—In my last number, I alluded to power, in the abstract, and made some suggestions in relation to the difference between animal and mechanical power. Leaving the subject of mechanical power, as I then proposed, I shall now proceed to consider the application of animal power; and in so doing, shall have reference principally to the power and use of the horse, whose services are in constant requisition, and whose powers are familiar to us all.

The application of the power of a horse, in the ordinary occupations of life, would seem to be a very simple matter, as it really is, and hardly worth a minute investigation; and yet we shall find, as we progress, that the result of every animal effort must depend upon a vast variety of principles and circumstances, connected with the exertion made.

Upon the structure of the animal, much may depend, as I had occasion to notice when treating upon the Horse in vol. ii. Every animal is a beautiful piece of mechanism, made up of exquisitely fine wrought pulleys and levers, which are forced into vigorous action at every exertion of power. A horse, from the very nature of his formation, is peculiarly calculated for draught. To exemplify this, let us consider for a moment the difference in applying the power of a man and a horse. The process of dragging is produced by throwing the body forward, and making its weight available as well as its strength, thus making the feet the fulcrum of a lever, and the weight and strength the effective power. The centre of gravity in both animals is about the centre of the body, to wit, just behind the shoulders in the horse, and just below the arms in the man. Now, supposing the weight and strength of both animals to be the same, the fact, that the hind legs of the horse must be considered the fulcrum, necessarily throws the centre of gravity much further forward in the horse, than it could possibly be done by the man. Consequently, the effect produced must be in proportion to the weight of the body and the distance the weight is applied beyond the fulcrum. This is constantly the case in practice. The muscular strength of a man is nearly as great as that of a horse, but from his upright construction, he cannot apply it in the same way. He can carry a great weight up a ladder, if applied to his shoulders, and yet in the act of pulling, his power is lost, for the want of weight, and its proper application. The horse too, in ascending a steep hill, can produce very little effect, because in that case his whole muscular strength must be exerted against his own gravity and that of the load; while on a horizontal surface, he is enabled to take advantage of his great weight, as well as muscular powers.

Now, although the weight of a horse may remain the same, and be applied under most circumstances with the same effect, not so with the muscles. A constant strain upon them will soon destroy their power of action, and render the animal useless. We are all aware of this from experience,—thus we feel more fatigue by standing than by walking, because one particular set of muscles is then kept constantly exerted. We must therefore vary the resistance, so as to suit the power and gait of the animal. But in varying the resistance, it cannot be elastic or yielding, except at the expense of power; for in that case, if too much power should be applied, the horse would naturally fall forward, and thereby lose his exertion; and if the power should be insufficient, he

would be drawn back by the strain, and it would require a greater effort to restore the motion. This is constantly exemplified in towing canal boats, and in the lead horses of stage coach teams. In the former case, the length and curve of the rope give an elasticity to the strain; and the necessity of keeping the rope out of the water compels the animal to keep up an unremitting pull in an oblique direction. So in harnessing horses one before another, the leader by tightening the traces is constantly relieving the strain from the wheel horse, and the wheel horse from the leader, so that these horses labor under all the disadvantages of a long, elastic, and constantly yielding load, which is not only fatiguing, but prevents their united exertion upon the carriage. A horse therefore, to work to advantage, must have a rigid resistance, but neither uniform, nor without remission. Hence we readily perceive, why a horse works easier on an undulating road than upon a perfectly level one, and also why he will draw more, when attached directly to his load, than when at a distance.

The effect gained by the action of a horse, or in other words his productive muscular power, must depend upon his rate of speed, the power of traction he can exert, and the number of hours he can work. As these are important considerations, connected with the application of animal power, it is desirable to examine them more in detail, and with that view, I shall avail myself, as heretofore, of the statements and calculations of Mr. Tredgold and others.

Neither the speed or power of a horse can be of any avail, unless some useful effect is produced, over and above mere velocity. Now, the limit of speed in any horse is the distance he can accomplish in a given time, for several days in succession, without weight; and the limit of his power, is when the weight can scarcely be moved. The medium point between these two limits is evidently the one most advantageous for the application of his power. This medium is said to be half the extreme or limit of velocity of a horse working unloaded; and the force of traction, half the limit of his power. For instance, if six hours be the length of a day's work decided upon, and if a horse working that time can go six miles per hour unloaded, and therefore producing no useful effect, and supposing the limit of power of the same horse equal to 250 lbs., it is found that he will do the most work in the same number of hours, when drawing a load at the rate of half six, or three miles per hour; and half of 250 lbs. or 125 lbs., will be the strain corresponding to this speed. As the limit of velocity depends upon the time the speed is kept up, the following table, drawn from experiments, will show the proportion of duration of labor, and maximum of velocity, of the average of horses:

Duration of labor in hours.	Velocity in miles per hour unloaded.
1	14½
2	10½
3	8½
4	7½
5	6½
6	6
7	5½
8	5½
10	4½

This evidently shows the advantage of reducing the speed, and prolonging the exertion. It will here also be seen, that the velocity of horses, corresponding to eight hours' work, is five miles and a quarter per hour; and consequently the rate at which he would travel when loaded is but little more than two miles and an half per hour. But Mr. Tredgold estimates, from long ex-

perience, the time in which the average of horses can accomplish most work without injury to themselves, to be only six hours per day, instead of eight, which will of course increase his average velocity when loaded, to three miles per hour.

But we cannot always control the velocity and time of duration, as here supposed, for our stage coaches, and other conveyances for passengers, have reference only to speed, and the great object of proprietors is to obtain it with the greatest economy. Mr. Tredgold has given a table which shows at once the reduction of effect by increasing the velocity. A force of traction of 125 lbs. continued for six hours at the rate of three miles per hour, is taken as the standard, and considered equal to the arbitrary number, 1,000. The first column will show the velocity or rate per hour, continued for six hours per day; the second represents the force of traction of which the animal is capable; and the third, the comparative effects produced.

Miles per hour.	Force of traction in lbs.	Effect produced.
2	166	888
3	125	1,000
3½	104	972
4	83	888
4½	62½	750
5	41½	555
5½	36½	500

If, however, the hours of labor be lessened, taking the velocity corresponding to the greatest useful effect, the results will be much greater, and the velocity may be raised much higher, as will be seen in the following table.

Here the first column is the length of day's work, the second the velocity corresponding to that time, or half the limit of velocity shown in table first, and the third column the comparative effect produced, the force of traction being in each case 125 lbs.

Duration of labor in hours.	Velocity—miles per hour.	Effect produced.
2	5½	578
3	4½	709
4	3½	813
5	3½	909
6	3	1,000
7	2½	1,063
8	2½	1,110

To attain higher velocity, it is necessary still further to reduce the load, and the following table is calculated upon the supposition of the strain being only one half the last, viz. 62½ lbs.; this is about the average exertion of each horse in a four horse heavy stage coach.

Duration of labor—hours per day.	Velocity.	Effect produced.
4	5½	613
3	6 2-5	534
2	7 4-5	434
1	11	307

In mail or light coaches, where ten, eleven, or twelve miles an hour is attained, the average strain of each horse is barely 40 lbs., and the effect produced, not much more than one half the above, or 160.

These tables are calculated upon the supposition that the roads are good and the resistance small, and therefore allowance must always be made when roads are uneven, for increased resistance, and a corresponding expense of power. It will be observed, too, that in rapid travelling the power is much more expensive, owing to the great loss sustained by increased velocity; and the bad consequences of a uniform strain are more severely felt by the horses, and therefore occasional relief much more urgent.

From all that has here been stated, it will readily be seen how important it is to all persons engaged in transporting property

to understand fully the principles which regulate the increase or diminution of effect produced by their teams, and no persons have a greater interest in this subject than farmers. Their great object, with others, is to obtain the greatest amount of effect, with the least expense, and with the least expenditure of power. Let every man then, investigate this subject for himself, that he may know when and how he is obtaining the greatest possible effect, from the expense and power applied. QUERCUS.

### No. III.

In farther pursuing our inquiries relative to the application of animal power, the *modus operandi*, or the manner of attaching the power to the weight, forms an important consideration. We have seen that the structure of the animal, his muscular power, speed and bottom, and the quality and degree of resistance, all have more or less influence upon the effect produced; and we shall now find that the mode of harnessing a horse, and attaching him to his load, also has an influence upon his productive labor.

If we could always use our draught horses upon railways, where the resistance is so slight, and its quality exactly what it should be, it would be a matter of little importance, in ordinary cases, how we connected them with their loads; but while we have to encounter every variety of resistance, up hill and down, over rough roads and smooth, it is important to avail ourselves of every circumstance, however trifling, which may increase our products without injury to our animals, or expense to ourselves.

In ancient times the harnessing a horse was a very simple matter. A strap around the neck, or a band around the girth, with a connecting rope or leather, was all that was thought necessary; and even in more modern times, every nation has a mode peculiar to itself, though all depend upon one and the same principle for effect.

But whatever may be our preferences, or however many our expedients, to decorate our animals, or modify their labor, the effect they produce will always depend in some measure upon the arrangement of the traces.

The angle of inclination, or in other words, the direction of the traces from the shoulder to the load, has been a topic of much discussion. There are but three modes of directing the traces: horizontally from the shoulder to the load—an upward inclination from the same point—and a downward inclination. These have all had their advocates; but so far as I can judge, the force of traction is not altered in either case. If the trace inclines upward from the shoulder, then a portion of the animal's weight is borne by the trace, and of course communicated to the carriage; and if the trace is inclined downward, the effect is, that the horse lifts, as it were, a part of the load; while in both cases, the force of traction is the same as that exerted upon a horizontal trace. In the first case, the effect is increased by the weight of the animal; in the latter, by his muscular strength, or capability of sustaining weight. The advantage or disadvantage, then, of either of these modes of application, must depend upon something else than mere force of traction.

But there is, nevertheless, advantages to be gained in the use of these several modes. It is evident, from the very construction of different horses, that their capabilities are essentially different, though their force of traction may be the same. One may be a small, muscular, nervous animal, exerting

an average force of traction of 125 lbs.; another, with large muscular legs, is perhaps calculated to sustain a great weight; while a third may possess an unwieldy bulk of flesh and bone, which of itself is a load, and yet neither of the latter horses be able to exert a greater force of traction than the former. In the first case, comparing one animal with the other, nothing would be gained by deviating the traces from a horizontal direction. In the second, an evident advantage would be gained by inclining the traces downward, for then the effect would be increased by putting a part of the load upon the horse, thereby leaving less weight to be operated upon by his force of traction. And in the last case, a corresponding advantage would be obtained by inclining the traces upward, so as to take the benefit of the animal's weight in addition to his strength. Hence it is evident, that so far as the animal is concerned, the inclination of the traces ought to depend upon his particular capability, and not upon any general rule.

But, independent of the animal, there is another consideration which should influence the inclination of the traces. In the above cases, I have supposed the weight to be moved upon a smooth surface; but it is evident, where the road is rough and the resistance constantly varying, a great advantage may be gained by enabling the horse to lift a part of his load over the obstacles; which will be effected by inclining the traces downward, let the animal's capabilities be what they may. On most of our roads, however, there is a constant variation from smooth to rough, from ascent to descent; and it will, therefore, be desirable for every man to fix upon that inclination which on the whole will best suit his circumstances; for it would be impossible to change the direction of the trace at every change of surface. Hence we find how much more effect wheel horses are enabled to produce upon our common roads, than leaders; for the latter can never apply their strength except in a horizontal direction; while the former exert the same force of traction, and at the same time increase the effect, by their nearness to the load, and relieving the weight. Hence, too, it is evident, that upon ordinary roads, the mode of harnessing horses one before another, as in our stage teams, is not the most efficacious mode of applying their powers. The plan adopted by the New-Jersey and Pennsylvania teamsters, of harnessing four horses abreast, and directly to the carriage, is doubtless the most efficient, if not the most convenient.

The common use of the gig, or dray cart, is another exemplification of this principle. The weight thrown upon the shafts is the same thing as weight applied to the traces by a downward inclination; and it is well known to practical men, that most horses will carry the same load easier in this way, if correctly divided, than where the whole depends upon the animal's force of traction.

The fitting of the trace to the collar is another point worthy of remark. The structure of the horse, however, determines this matter almost wholly; and generally, in this country, it is judiciously applied. The connecting point between the collar and the trace should be about two-thirds of the distance from the top of the collar to its lowest extremity, for there the collar bone is smallest, and the most muscle is presented to sustain the pressure. The old fashioned New-England mode of applying a connected trace around the breast, and sustained by a strap over the neck, was exceedingly irksome to the horse, as the whole strain passed directly over the joint

of the collar bone, and thereby nearly paralyzed the operation of that joint.

In general, then, where the road is smooth and the gait slow, the traces should be as nearly horizontal as possible; unless where an extraordinary exertion is required, and then the traces should be a little inclined downward, so as to put a small part of the weight upon the horse. When the road is rough, and the gait also slow, the traces should be applied still lower down, so as to give the horse the greatest power over obstacles. But where great velocity is required, without much attending weight, the nearer the traces can be brought to horizontal the better, for then the horse is enabled to exert his force of traction without any counteracting influence.

In my next number, I shall proceed to consider, in part, the second branch of this subject, to wit, the vehicles to be moved, in connection with the channels of conveyance, but with especial reference to Canals and Canal boats. QUERCUS.

**CHINESE GONGS.**—We have been furnished by a friend with several numbers of the *Asiatic Journal*, in which we find the following description of the composition and manufacture of the "Chinese Gong," an article now much in use in hotels. They are, especially to those unaccustomed to early rising, instruments of "horrible music;" yet, to many, an article of considerable interest, as it has often been said, and by many believed, that they cannot be made in this country.

**Composition of Chinese Gongs.**—In the *Annals de Chimie* for November, there is the following account of the Chinese process of manufacturing gongs and cymbals, translated by M. St. Julien from the *Teen-kong-kae-wei*, a Chinese encyclopædia of arts and manufactures:

"The red copper, used in making musical instruments, must be alloyed with mountain-tin,\* which does not contain a particle (*lit.* a vapor) of lead. In order to make gongs (*lo*), &c., eight pounds of copper are alloyed with two pounds of tin. If you wish to make little bells or cymbals, the red copper and the tin must be much purer and finer than for gongs.

"When a gong is to be made, it must not be cast in the form it is to have, and then forged with the hammer. You must begin by founding a thick sheet of metal, which must be cut round, and then beaten with the hammer. For this last purpose, the round sheet of metal must be spread upon the ground, and if the instrument is required to be of large size, four or five workmen must be placed around, to hammer it. The sheet will spread out and enlarge under the hammer, and its edges will rise up. Then the instrument will begin to emit sounds, resembling those of a musical cord. All these sounds proceed from the points which the hammer has struck (*lit.* from the points struck by the cold hammer.) In the centre of this drum of copper, a boss or round elevation is formed, which is struck, and the blows of the hammer give it the tone. Two tones are distinguished in the gong; the male tone and the female tone. Both depend upon the rising being less or greater than ought to be given, with rigorous exactness, to the boss, according as one or other is desired. By doubling the blows

\* The Chinese have two sorts of tin, mountain-tin and river-tin; both are found in the province of Kwang-se.

of the hammer, the instrument acquires a grave tone."

M. Darcet, in a note upon this translation, observes: "The only thing I find correct in this account is the composition of the alloy, of which the Chinese author states these instruments are formed. I have analysed seven gongs and twenty-two cymbals, and I have always found, in 100 parts, about 80 of copper and 20 of tin. It is true, about five or six years ago, an original letter was communicated to me from a missionary, which stated that gongs contained, besides copper and tin,  $\frac{1}{10}$  of bismuth; but the properties of this alloy and the result of the analyses just mentioned, show that the workman deceived the missionary on this point. I regard then, as a fact proved, that these gongs and cymbals are composed of an alloy formed with 80 parts copper and 20 of tin; but this is far from sufficient to enable us to fabricate these instruments; for this alloy is as brittle as glass, and if it be used as it comes from the crucible, it would be not only impossible to forge it, but even to use such instruments, merely cast with this alloy, without their breaking. This happened to an untempered gong, which had been made at the school of Chalons for the king of Prussia, and to the gong at the opera, which being cracked, was heated in order that it might be mended with silver solder. The alloy of 80 parts copper and 20 of tin is so brittle, especially when hot, that it may be reduced to powder. This alloy has great density; its grain is very fine, and its fracture almost as white as that of bell-metal. Chinese gongs and cymbals, on the contrary, have a small specific gravity, and a fibrous fracture exhibiting the color of the alloy, of 90 parts copper and 10 tin, used for cannon. Fragments of gongs and cymbals, far from breaking under the pestle, are malleable, and may, moreover, be bent till the two sides of the piece form together an angle of 130 or 140 degrees, without breaking. It follows clearly from this comparison, that gongs and cymbals cannot be fabricated as the Chinese author pretends; that it is only by means of some peculiar process, some sleight of hand, that an alloy of 80 parts copper and 20 tin can be employed in this manufacture. This secret consists in tempering the alloy; in fact, when heated to a dull cherry red, and plunged into cold water, it takes instantly all the physical characters of the gong and cymbals: I have manufactured by this process upwards of sixty pairs of cymbals, and experience has fully justified what I have stated.

Nothing is said in the Chinese account about tempering; yet without this operation, it is impossible to fabricate these articles. As to the mode of making them, the alloy of 80 parts copper and 20 tin, even when tempered, cannot possibly be forced, and especially beaten out. All the Chinese author says about casting the alloy in the form of a plate and beating it out with the hammer, is a mere fiction, imposed upon him by a Chinese artificer, just as our artificers endeavor to mislead curious visitors in our manufactories. The following method is, in my opinion, the true one.

"The model of the instrument is forged in red copper or brass; to this model is given exactly all the desired forms, by making the face of the hammer penetrate more or less on the two surfaces, so as to form that continuity of spherical hollows and salient parts we see upon cymbals, and especially gongs. When the model is finished, it is employed to make a mould in sand, in putty, or in metal. An alloy of 80

parts of pure copper and 20 of fine tin is prepared, which is run into an ingot; it is then re-cast and run into the mould. The piece, when taken out of the mould, is rough-scraped; it is tempered as is done with steel. If it is misshapen, by plunging it red hot into cold water, the shape may be rectified by the hammer and by flattening it with gentle blows. The required tone may be given, either at first, by forcing the temper more or less, or afterwards, by hammering; it is polished by means of a lathe, as is done with saucepans of copper or brass, and the instrument is finished."

**Buildings of Canton.**—In the buildings of Canton, we have doubtless as great a variety of structure and style, and as fair specimens of Chinese taste and art, as can be found in the whole empire. A large part of the city and suburbs is built on low ground or flats. Special care, therefore, is requisite in order to secure for houses and temples a solid basis. Near the river, and in all the most loose or muddy situations, houses are raised on wooden piles, which make the foundation as secure as brick or stone, and perhaps more so. In some cases, the piles rise above the surface of the ground, and then the buildings, constructed of wood, rest directly on them; but, in other instances, the piles reach only within a few feet of the surface, and the remaining part of the foundation is made of mud, brick, or stone. When this is done, the walls of the houses are usually carried up and completed with the same material. Not a few of the houses are entirely baseless, or have only a slender foundation of mud, of which also their walls are composed; and hence, in severe rain-storms and overflows of the river, many of the walls are prostrated.

Bricks are in most general use for the walls of houses; perhaps three-fifths of the whole city are built of this material; of the remaining part, a very large portion is constructed of mud: most of the Tartars in the old city inhabit houses of this description. Stone and wood are not very extensively used for the walls of houses; the first is frequently employed about gateways and for door-posts; and the second for columns, beams, and rafters. Many of the floors of houses and temples are formed of indurated mud; marble flags are sometimes used for the same purpose, and often tiles. The latter, when made very thin, are used for roofs; they are laid on the rafters in rows alternately concave and convex, and forming ridges and furrows, luted by a cement of clay. Windows are small, and rarely supplied with glass; paper, mica, or shell, or some other similar translucent substances, taking its place. Very little iron is employed in building houses.

Such is the general style, and the usual material, of the buildings of Canton. In passing through the streets of the city, the spectator is struck with the difference he finds in its various buildings—though this diversity does by no means fully exhibit the relative condition and circumstances of the people. A few only are rich; and the external appearance of their houses does not at all exceed in elegance those of the middle class. Many are very poor; and the aspect of their habitations exhibits abundant evidence of their abject state. The poorest people are to be found in the extreme parts of the suburbs, along the banks of the canals, and in the northern part of the old city; their houses are mere mud hovels—low, narrow, dark, uncleanly, and without any division of apartments. A

whole family of six, eight, ten, and sometimes twice that number of individuals, is crowded into one of these dreary abodes. It is surprising that people can live, and enjoy health, and even long life, in these circumstances. To pass through the streets or lanes of such a neighborhood, is sufficient to reconcile a person to any ordinary condition of life. Neither intelligence nor industry could ever be confined in such miserable cells.

In habitations a little more spacious and cleanly than these, perhaps one-third part of the population of Canton have their abodes. These stand close on the streets, and have usually but a single entrance, which is closed by a bamboo screen suspended from the top of the door. Within these houses there are no superfluous apartments: a single room, allotted to each branch of the family, serves for a dormitory, while a third, which completes the number into which the whole enclosure is divided, is used by all the household as a common eating-room. Chinese houses usually open towards the south; but in these, as also in the poorer kind, this favorite position is disregarded. Houses of this description are rented at four or five dollars a month.—[Chinese Repos.]

**QUICKSILVER VS. STEAM.**—It is stated in the London Times that the Earl of Dundonald (better known as Lord Cochrane) was examined last session, before the Common's Committee, on steam navigation to India. His Lordship, among other matters, said he had projected "a substitute for steam," as well as "a new mode of propelling vessels." The substitute for steam is quicksilver; and he employs it "to produce power by exhausting one vessel and compressing air in another, thus forming an atmospheric plenum or vacuum, which will produce the same effect as the plenum and vacuum formed by the generation of steam and its condensation." This plan (superseding the necessity of carrying coals) he added, is peculiarly adapted to agitated water like the sea. The plan may be wholly worked without fuel. The evidence and papers are too long for extract, but his lordship concludes this part of his evidence with stating, that "vessels fitted with quicksilver apparatus might be provided with sails of the usual kind there would be no smoke nor any fire, and there need be no indication from their external appearance that they are equipped in any other manner than as sailing vessels. As to the method of propelling without paddle wheels (his Lordship says), I should be happy to lay it before the committee, were my patent right secured."

**HOW TO ACQUIRE KNOWLEDGE.**—Young men, would you be intelligent? Carry a book about you *always*. Not a novel—but a work of utility—a work in which you may read of realities, not fiction. Would you be wise? Open and read that book whenever you have a moment of leisure. I recollect to have read an anecdote of a *sheemaker*, even after he worked as a journeyman, who always kept a book open before him, so that he might not lose a moment, but be preparing himself for future usefulness; and the result was, that he became not only one of the most eminent, but one of the most useful men of his day. Why, my young friend, may you not, by pursuing a similar course, also become eminent and useful to your country and your fellow men? Adopt the course, and give it a fair trial, and if you do not succeed to the extent of your ambition, I will guarantee that you will not be the worse mechanic, or citizen, for the experiment.

## NEW-YORK AMERICAN.

MARCH 14—20, 1835.

## LITERARY NOTICES.

ORMSBY'S PENTOGRAPHIC ILLUSTRATIONS OF THE HOLY SCRIPTURES, &c. &c., Part I: ORMSBY, 22 Nassau street, New York.—We have had occasion heretofore to speak of the ingenious machine—the Pentographer—which does by mechanism, what the combined operation of the human eye and hand, was alone supposed able to effect.

The work now before us, furnishes accurate copies of the remarkable series of medals executed by *Thomason* of Birmingham, illustrating the Scriptures—and the effect produced by the engravings is really almost equal to that of the medals themselves. The reverse of each medal presented a brief historical extract from the Bible, explanatory of the subject selected. This is given too by the Pentograph, so that the face and the reverse of the medal are equally well preserved.

The whole will be completed in eight numbers, to be issued monthly at, for subscribers 37 1/2 cents each, for non-subscribers, 50 cents.

REPRINT OF BLACKWOOD'S EDINBURGH MAGAZINE, THE METROPOLITAN AND FOREIGN QUARTERLY, Nos. 2 and 3: *N. Haver, PECK & NEWTON; N. York, P. Hill & Co.*—This is, we are told, the only reprint of Blackwood, or the Metropolitan. The three works which this undertaking comprises, would cost, if imported, \$35. They are offered here together for seven dollars! and well printed.

FRANKLIN LIBRARY OF MODERN LITERATURE, Parts XII. XIII. XIV. XV.; *N. York, WALLIS & NEWELL*—The Bondman, a story of the time of Wat Tyler, and Tales of Woman's Trials, by Mrs. Hall, chiefly occupy these four numbers, of which the price is only one shilling each.

THE AMERICAN MONTHLY MAGAZINE, New Series, No 1; edited by C. F. HOFFMAN and H. W. HERBERT: *New York, D. K. MINOR, & T. & C. WOOD*.—This is no new candidate for popular favor, but one that has given proofs of deserving it, and wears well, what it has fairly won. In one respect it does indeed present a new claim, and that is, its having passed into the possession of the author of "A Winter in the West," Mr. C. F. Hoffman. We feel assured that this is a claim which will be readily allowed, and that the talents and acquisitions which he will bring to this Magazine, will add to the favor with which, while under the sole control of Mr. Herbert, it has been so deservedly received. Their united labors, aided by contributions from well practiced and well renowned pens—as we have reason to know they will be—cannot fail to establish the reputation and extend the circulation of this periodical. The number before us, has a large share of good papers; the first and the last alone, we apprehend are from the pens of the editors. In "the fortunes of the Maid of Arc," it is impossible not to recognize the glowing pen—the abounding incident—the impassioned style, and the admirable fidelity to historical costume, which made "Some Passages in the Life of Mary Queen of Scots," and other papers on analogous subjects, so eminently attractive and impressive.

In "The Ghost riders," the descriptive power, the delight in Indian legends, and the vivid imagination, which give to "the Winter in the West" the interest of romance without departing from the soberness of truth, are again exhibited to advantage. It is a thrilling story.

But we find it impossible to speak at length of

all the contents of the Magazine, tho' we will not deprive our readers of one, at least, of its tales. it is not long, and it is exceedingly well told.

A word to the publishers. The paper should be better, and the stereotype more regular and accurate.

## An Incident at Algiers,

DURING THE VISIT OF DECATUR'S SQUADRON IN 1815.

The bay of Algiers is one of the most beautiful I have ever seen. The harbor is in a semi-circular form; at the further recess of which the city rises gently from the sea; and her white walls, flat roofs and terraces, from the narrowness of the streets, seem, from the seaside, joined together until they reach the surrounding hills—which are crowned with vineyards, and form altogether a striking and picturesque amphitheatre. On the western point of this harbor, a neck of land projects into the sea, and on its extremity is built one of the strongest castles for the protection of the place. It was from the guns of this castle, that in a few months after the period of which I am speaking, the ship commanded by Admiral Milne, in the gallant attack of Lord Exmouth, suffered so severely. Close in with this fort our boats were obliged to pass on their way from our ships to the landing.

Delightful as was the appearance of all this to the eye, yet from our early recollections of blood and crime connected with the history of the place, we beheld it but as a "whitened sepulchre," and the intimation that we were soon to sail for the ulterior objects of our expedition, was received, I believe, with general satisfaction.

A constant intercourse had been established between the squadron and the shore from the moment when our difficulties with the Dey had been adjusted, and the treaty had been signed "word for word as it had been sent on shore." Crowds of officers were daily visiting the town, and among them the midshipmen of the different ships were always to be seen dispersed over the place, seeking with a perfect unconcern, even in sacred and forbidden ground, for objects to gratify their curiosity; receiving the courtesy of those Algerines with whom, when they were our prisoners, they had become acquainted, with as sincere a good-will as if they had never been enemies, or returning the haughty scowl of some stranger Turk with a smile of reckless indifference.

It was my good fortune, in addition to my ordinary visits on leave to the shore, to attend the commodore as one of his aids, in those which he made to the chief officers of the government; and I often had my feelings strongly excited by the humble looks and broken-hearted demeanor of the Christian slaves, by whom the lemonade and coffee were prepared and handed to us. Although habited in the loose petticoat-drawers, and slippers of the Turk, they were easily distinguished by their long plaited hair, the absence of moustache and beard, and above all by their dejected mien, from their lazy and overbearing masters. I had taken a deep interest in them, and had become familiar with many of their faces. Among them there was a young Italian of about five and twenty, the melancholy expression of whose handsome features had, upon my first seeing him, attracted my attention. There was something in his eye that spoke of prouder, happier days; and the quiet and almost indignant manner with which he calmly received his master's bidding, indicated that his spirit was not yet quelled within him, and was strongly contrasted with the readiness with which that bidding was obeyed when it administered to our pleasures.—It was evident that from some cause his feelings towards us were those of confidence and friendship. It might be that he looked upon us as connected with him by our common faith, or perhaps he felt grateful to us as the victors, who had humbled those who had enslaved him: and perhaps—and more truly as I afterwards thought—the hope of freedom was dawning on his spirit, and he regarded us as friends upon whom he might soon call for aid and protection. But whatever were his feelings, ours had been so strongly interested in his favor, that several of us juniors were at some pains to learn his story; and

through the kindness of Mr. P., of Virginia—who had been detained since the capture of his vessel, a paroled prisoner at Algiers, until released by our squadron—we were enabled to gratify our curiosity. The tale of poor Angelo Salvini has often been told with darker additions, but I thought it gloomy enough, when I first heard it.

It was a beautiful night in the spring-time season, and the breeze, that floated along the coast of Calabria, though rife with a thousand sweets, was not more blithe in its gambols over tree and rock, and moon-tipped wave, than two young hearts which there swelled with rapture, as a bridal party danced upon the strand. An hour afterwards the scene was fearfully changed. There were marks of disorder in the adjacent thicket, as if a large body of men had rushed from them towards the shore, and there were traces upon the beach that could hardly be left by the light foot of a dancer—

"Steps stamped and dashed into the sand,  
The print of many a struggling hand!"

and a silken scarf, or torn mantle, fluttered on the water's edge, or drifted before the rising wind, which now moaned around the headlands, as if unwilling to fill the lessening sail of the Corsair that was springing, with her prey, before it.

Poor Angelo! he knew not—and well he did not—what became of his bride. But like all exiles, who fondly think, that, can they but see their native land again, they may recover all that made it dear, his whole soul seemed bent upon seeing his Italian home once more, when somehow by the blessing of "our Lady," all would come right. He was never seen to smile, and there was that earnestness of expression in his face—that blending of manly resolution and winning gentleness, which had so struck and touched us at once—which, in a word, had interested all of us most deeply in his fate.

The incidents of that cruise were generally so novel and interesting, that the story of Angelo Salvini may have been forgotten by other officers, among themes of a gayer and more engaging character. But there are reasons why it can never be erased from my memory.

The arrival and vicinity of our squadron had caused an additional rigor in the treatment of the prisoners, and as a precaution against their escaping to any of our ships, they were compelled to carry about with them a ball and chain, which in our country are only worn by the most desperate felons. Decatur, with that generosity which so distinguished him, did not hesitate at his interview with the Dey, strongly to remonstrate against this degrading sight, which he and his officers were compelled to witness. The Dey replied, that this severity was indispensable, while the Christian ships were in the offing; but that if Commodore Decatur would pledge his word as an American, and his honor as an officer, that he would not countenance the escape of any of the captives, their rigorous treatment should be relaxed, and every indulgence short of liberty should be accorded them during the stay of the American vessels. The pledge was given for the captives' sake, and strict orders were issued throughout the squadron, that no prisoner was to be allowed to enter a boat, or under any circumstances to be brought off to the ships.

It was about noon, one day, when after landing a superior officer on the mole, from the second cutter, we had shoved off, and letting fall our oars, were soon under rapid way. We had proceeded the whole length of the basin, and were just doubling the castle which I have already described, giving it only berth enough to avoid the low rocks, that are piled for some short distance around its base, and behind which a person might easily be concealed. We were so near, as we passed, that the musketoon of the Turkish sentinel was perfectly perceptible, as he paced up and down between the groups of cannoniers, who were eyeing us through the embrasures of two large pieces of ordnance, that nearly ranged with the point towards which I was pulling from the shore. My attention was directed to them, and the water was a little rough, which perhaps prevented me from seeing any object floating near the boat; and I was not a little surprised, when I saw the head

of a man suddenly dart above the gunwale, holding with his teeth a knife, while his hands grasped eagerly at the blades of the oars, as the headway of the boat appeared to be carrying it past him, before he could make good his hold. His hands were on the quarter before my order had saved him from more than one blow with the looms of the oars. I seized the struggling swimmer by the shoulder, and with the aid of my stout coxswain, he was quickly placed beside me in the stern sheets: but what was my horror upon discovering, while the man yet clung to the gunwale, that it was a Christian captive—that it was Angelo Salvini.—The instant commotion among the people collected on the mole, told me that it was impossible to screen him for a moment. To carry him off to the ship, in the teeth of the orders I had received, would have been madness. Yet, how could I deliver him up to the hellhounds that were even now opening upon their prey! There was a discordant cry from the infuriated crowd upon the mole, which, although unintelligible to me, yet its dreadful import to poor Angelo could not be mistaken; and in a moment the cannoniers hurried along the walls of the fortress, while a dozen caiques shot from beneath its battlements. The eyes of my gallant crew, that but now melted with pity, flashed defiance, as they beheld this movement around the bristling cannon. But when they saw boats hurrying in pursuit, they curled their lips in scorn, and gripping their oars, with a nerve that made them quiver in their rowlocks, they glanced at me so imploringly for the captive, and so triumphantly for themselves, that pity and pride almost obtained the mastery over duty, in my bosom. A single word from my lips, and the destruction threatened by the Infidels would not have prevented my noble fellows from sweeping beyond the reach of the Corsair boatmen. A single word, and, if we escaped the fire of the Moorish battery, which, from past experience no one dreaded, the hapless Angelo would have been at least in temporary safety beneath the Stars and Stripes. But I knew my commander too well to tamper with an order, that had been so imperative as that in relation to the captives. His honor as an officer, and his duty as a disciplinarian, would alike have insured the surrender of Angelo, and the punishment of myself; an aggravation of misery to the one, and the disgrace attending so gross a breach of orders to the other, would have been the certain consequences of my pursuing a different course of conduct from what I did. Yet, I shall ever remember it as one of the most painful moments of my life, when, as the barge of a Turkish officer hauled alongside of me, I determined to surrender the fugitive. I turned for a moment to look, before the act was done, at Angelo,—there was a resolved fixedness in the expression of his face, as he eyed the exulting look of those who claimed him, that revealed the determined purpose he had formed. Freedom had been almost within his grasp, and yet not a murmur, not an imploring word escaped his lips—they moved, but I thought it was in prayer to that cross, the bright symbol of his faith, and before which he felt the crescent had often paled.

But when I gave him up, and they were dragging him somewhat roughly into their boat, he turned and gave me one parting look, while his eye rapidly moved from my button to my face, as if he almost expected to see my countenance bear witness to what he deemed the tarnished badge of our service. That look, I never can forget. It was a mingled look of contemptuous scorn, and disappointed confidence. And yet, I could not, and I did not blame him. He knew not that I, as well as himself, was the victim of my orders. He knew not that the pledge, given by a chivalric sailor as ever stepped a ship's deck, was given for the captives' comfort, and must be fulfilled for our honor: but that look, and the appealing murmurs of my men, almost shook my purpose; and, boy as I was, I so far forgot myself as almost involuntarily to seize my dirk, and to threaten, in my own language, as I leaned over the quarter, my impotent vengeance against the officer, in case he harmed the Italian. "The malignant and turban'd Turk" only answered with a scowl, as he turned round after gaining a boat's length from me.

The rapidity, with which the succession of incidents had occurred, prevented me from observing what had become of the knife, which, when I first saw the poor captive in the water, had attracted my attention, and I presumed that in lifting him on board, it had dropped into the sea.

My feelings had been wrought up to such a thrilling pitch of excitement, that ordering my men to drop the boat astern, in order to gain a more distinct view of the landing, we laid upon our oars watching his reception on the shore. A yell of delight told that they had touched the strand with their prisoner. There was an excited movement in the crowd—a rush and a struggle along the mole. My boat's crew sprung to their feet involuntarily,—and the tall bowman swore that he saw the knife of the Italian red with the blood of at least one Moslem, before a dozen aghas had cut him to pieces.

Poor Salvini! To avoid the horrible fate that he knew awaited him in being bastinadoed to death, he had stabbed the Turkish officer, and had fallen an immediate victim to the vengeance of his men. O.

We abridge our Review to-day, not unwillingly, to make room for some poetry breathing of flowers and spring, sent to us, too, with a bouquet of most fragrant double violets, of which the odour and the associations—time has been—would have almost moved, even our editorial gravity, to the perpetration of rhyme. As it is, we have only plain prose to thank our unknown lady correspondent—for lady she surely is, not less by the taste of the *envoi*, than by the delicate hand writing of the annexed note—and to insert at the earliest moment the lines it enclosed.

To the Editor of the New York American:

At this season, when exotics are carefully preserved in green-houses, I am often reminded of a sprightly and appropriate effusion, suggested by an admirer of those beautiful and care-demanding favorites. The poetry was sent me by a friend some time since, as having been a source of much entertainment in her vicinity.

Will you be so indulgent, as to distinguish the enclosed by a space in your columns? and oblige an

UNVARIED PERUSER.

Mr. —, after arranging his conservatory for the winter, placed the following lines there, and proceeded on an excursion: upon his return, he found "the complain."

#### ON A GREEN-HOUSE.

Here, side by side, in beautiful array,  
The blushing plants their various forms display,  
Watch the clear sun, and open all their smiles,  
When he in courteship with his warmth beguiles.  
Gay emigrants! to this fair land they come,  
And call this peaceful scene their native home;  
The South sends many, some the Tropics' clime,  
Here spring reigns ever, ever in its prime;  
Her *Jasmine*, *Catalpa* sends from far,  
That gleams gay with many an ivory star;  
Spangled with gold, *Acacia* richly shines;  
Like Sultan decked from bright Peruvian mines;  
With scarlet blossoms, the *Pomegranate* glows,  
And fragrant *Daphne* blooms 'mid winter's snows;  
Her aromatic scent *Verbena* sheds,  
And various shrubs meet here from spicy beds;  
The gay *Cereus* on the trellis towers,  
Hereads the effulgence of his golden flowers;  
While modest *Violets*, beneath his feet,  
And humble *fox* plant creep from their retreat;  
*Hibiscus* and *Hydrangia*, watery friends,  
Assemble here; this, rich with blossoms bends,  
The other, mounts aloft, on high its beauty sends.  
With yellow fringe, *Hypericum* is dressed,  
Purer than snow *Cape Jasmine* wears a crest;  
No neck of swan so white was ever seen,  
As her chaste flowers enshrined in glossy green;  
*Camellia*, here with vivid-lustre glows,  
And bloom unceasing springs from *Catana's* Rose;  
The ruddy *Orange*, of no winds afraid,  
And kindred *Lemon*, join their social shade;  
*Mimosa* seems a plant that feels, and thinks;  
Like a coy maid, from slightest touch she shrinks;  
In nightly sleep she closes all her leaves,  
But the new morn, expanding, she revives;  
Decked with white blossoms, here, the *Rubus* stands,  
That looks like curious work, from Chinese hands;  
Here shines the *Mistle*, with *Geranium* pride,  
And rich *Cyanthemum* the Easten bride;  
The *Polyanthus*, with a diamond eye,  
And bright *Oxalis*, dyed in Tyrian dye;  
With *Pinks*, and tall *Cerastium*, flourish here,  
And sisters more, with all their robes appear;  
To this retreat, approach with cheerful mind  
Here nature's sweetest, loveliest, forms we find;  
Another Eden rises to our view,  
With colors ever bright, and ever new.

#### THE COMPLAINT.

At a full congregation,  
Of the leafy creation;  
In this once happy garden assembled;  
With once voice 'twas agreed,  
That 'twas time to proceed,  
As our grief could no more be dissembled.

And though nearly frozen,  
A *Jug* was chosen,  
To act as our scribe for the day!  
And the plants that were sick,  
Were prop'd on a stick,  
To hear what the speaker would say.

Resolved, that each flower,  
That o'er decked a bower,  
To our Patron, shall gratefully bow;  
And for all favors past,  
Every breath 'till the last,  
Its sweetness shall cheerfully lend.

Resolved, our complaint,  
Though 'twere almost too faint  
To speak half the anguish we feel  
Should yet be expressed,  
That we may be redressed,  
'Tis delightful such sorrows to heal.

The whole summer long,  
Passed away like a song,  
We then were so happy and gay;  
The sun in the morning,  
Our bliss was shining,  
And retired at close of the day.

But thinned are our ranks,  
From the green sunny banks,  
Where careless we flourished and grew;  
Our sisters, and brothers,  
And various others,  
One, by one, from our circle withdrew.

In the Green-house protected,  
While we are neglected,  
Secured from the cold chilling air;  
Where they sit snug, and warm,  
And heed not the storm,  
While we are left naked, and bare.

And now, 'tis so sickly,  
A "Fear" that was "prickly,"  
Has quite died away with the cold;  
And "Roses," and "Lilies,"  
And "sweet" scented "Willies,"  
Have all prematurely grown old.

This sad chilling weather,  
And every tug, ther,  
When we see them so gay, through the glass;  
We could march out in "Flies,"  
And give them a "Box,"  
For vexation whenever they pass.

The "Hydrangia" too,  
Having nothing to do,  
Would drink all the day, if he could,  
And pretends, (who'd believe him?)  
'Twas done to relieve him,  
Tho' hard drinking we know does no good.

And 'hen on a shelf,  
Thinking only of self,  
Sits the little "Mimosa" so shy;  
She's so very tenacious,  
And so little gracious,  
Not one of us dare to come nigh.

Oh! 'tis a "Warm" and "Rue,"  
Thus to have in our view,  
Our once neck, and humble relations;  
When such colds in our heads,  
Keep us all in our beds,  
To mourn o'er our own mutilations.

Our "Hearts-ease" is fled,  
"Jump-up Johnny" is dead!  
The "Larkspur" no longer can soar;  
And the "Nymph in the Bower,"  
And "Lion's bleeding flower,"  
Will ne'er feel the morning breeze more.

Oh! how people will change!  
'Tis as true as the strange,  
That the sweet "Evening Primrose" no more,  
Which was watch'd with delight,  
When it burst on the sight,  
Now withers and none will repine.

Not even the "Mint"  
Could buy such a tint,  
As deck'd our "Queen-Margaret's" cheek;  
But I have no "Thyme,"  
To bring it in rhyme—  
Its own faded beauty must speak.

The "Cassia-bell,"  
Has rung its own knell,  
And now is laid under the sod!  
But from farther north,  
His friends to protect,  
One plant waves its bright "Golden rod."

Oh now then relent,  
Of such treatment repent,  
And let us be happy together;  
And each grateful vine,  
In beauty will twine,  
And again wave our gay "Princess-feather."

'Tis little down shall be spread,  
To pillow thy head,  
And never again will we quarrel;  
An "Imp" at Green,  
Will hint in the town,  
And the brow shall be decked with the "Laurel."

By order of the Board. JOHN QUIL, Sec'y.

We think our readers will be grateful to our  
faith correspondent for these charming lines.  
There is yet an answer to the complaint, which  
our circumscribed limits, compel us to omit.

## FOREIGN INTELLIGENCE.

By the packet *Virginian*, Captain Harris, from Liverpool, we have papers of the 11th ult. from that port, and to and of the 10th from London.

Our continental intelligence by the *Rhone*, is later than that by this ship. Our direct advices from England, before, were only to the 2d or 3d.

We find nothing of material interest. The approaching meeting of Parliament, and the effort to be made by the opposition to oust Sir C. Mansel-Pleydell, (who is still, it would seem, to be the candidate of the Administration,) and to elect Mr. Abercromby, occupy the chief space in the newspaper discussions. The towns and counties were entering so earnestly into the subject, as by public resolutions to instruct their representatives to be punctual in their attendance on the first day of meeting.

The reduction of the armies of the Emperor of Austria, for which we give the official decrees, is estimated by the London Times, not to exceed 20,000 men, which as it well reasons, on a permanent standing army of 350,000, is not much like reducing it to a peace establishment.

"A Winter in the West," is now advertised in the London papers, as about appearing there from the press of R. Bentley. We predict confidently, a very successful run for it.

The London Courier of 9th pronounces, upon the authority "of a professional gentleman who has reason to be well informed," that the pregnancy of the Queen was certain.

The present King of Great Britain was born August 21, 1765, and the Queen, August 13, 1792. They were married July 11, 1818, and have no children. The present heiress presumptive of the crown, the Princess Alexandrina Victoria, daughter of the late Duke of Kent, was born May 24, 1819.

It turns out to be true that the Marquis of Londonderry has been appointed Ambassador to the Court of Russia.

The British ship Sir Thomas Munro, was lost on the Cape de Verd Islands, the captain, crew and passengers were brought into Plymouth in the American brig *Maine*, of Boston, Capt. Williams.

The late general election has returned one hundred and thirty-seven military and naval officers to Parliament.

Joseph Bonaparte came to London from his seat in the country, for the express purpose of meeting the Duke of Leuchtenberg, after the Prince had visited and dined with the King, at his palace at Brighton. The Duke and Joseph Bonaparte met at the house of a friend, where they were closeted for several hours.

It appears by accounts received from Vienna, that Austria has come to the determination of reducing her armies to a peace establishment, orders having been given to sell 10,000 horses belonging to the artillery, to send home part of the landwehr, and put the frontier regiments into their ordinary cantonments.

Our news from Madrid is of the 29th ult. at which time a general alarm existed lest a revolution should break out, and fresh troops are ordered into the capital from Extremadura. The greatest vigilance is exerted on the part of the Government—the post office is strongly guarded, and large patrols circulate through the streets at night. In the *Proceres*, on the 27th, General Quesada attacked Llander in a violent manner, recommending that he should be watched. The ex-minister had left Madrid on his way to Barcelona, where it was supposed he was to resume the Captain-Generalship of Catalonia, but the impelley of entrusting him with such a command has been so strongly urged on the ministers, that we do not think he will be allowed to retain the post. It was reported, indeed, that he had been actually recalled. The promises to the muti-

nous regiment of Arragon have been broken.—Caderro and others were ordered to the island of Island of Majorca, but suspecting evil designs against them, they made their escape. The non-commissioned officers were dismissed the service, the men drafted into our corps, and the regiments disbanded.

**PACIFICATION OF SPAIN.**—The London Morning Herald gives the following as the outline of Lord Wellington's plan for the pacification of Spain:

## CONDITIONS.

1. Abdication of Don Carlos in favor of his eldest son.
2. Withdrawal of Queen Christine from the Spanish dominions.
3. Immediate betrothment of the eldest son of Don Carlos with Isabel II.
4. The Government to be carried on in the name of Charles VI. and the *Estado Real* to remain in force.
5. A Council of Regency to be appointed, in order to govern the country until the young Prince be of age, (his majority being fixed at 18,) and to be composed of five members, among whom Zumalacarraguy and the Marquis de las Amarillas are necessarily to be included.
6. An unconditional amnesty for all political offences.
7. Securities to be given to the people of the Basque provinces and Navarre, for the maintenance of their fueros.
8. All loans or debts contracted in the name of the Anti-Salique dynasty, or in that of Don Carlos, to be acknowledged and considered as the Royal debt of Spain.
9. All ranks, titles, and decorations, conferred by the present Queen or Don Carlos, to be declared the property of those to whom they have been granted.

Lord Fitzroy Somerset is said to have actually left England on this identical mission. Don Carlos is to be allowed £50,000 a year.

**RUSSIA AND TURKEY.**—The London Morning Chronicle, of the 9th ult., says—

"We venture to state, from circumstances which have come under our own observation, that if ever Lord Ponsonby be invited to submit to Parliament an account of his mission to Constantinople, he will be enabled to show that he has struggled—and not ineffectually—though almost single handed, against the scarcely concealed exertions of Russia for the ruin and final subjugation of the European provinces of the Turkish empire. It will appear, unless we are greatly mistaken, that our present, or rather, perhaps, our late Ambassador to the Porte has ardently devoted all the energies of a powerful and accomplished mind to the solution of the many perplexities by which the Turkish question is still unpappily surrounded. Above all it will be made manifest that his counsels, if they had been followed, would have contributed to save Turkey from the ruin which now awaits her, and would, moreover, have rendered unnecessary the expenditure of blood and treasure by which we must yet rescue Turkey from the fetters of Russia, if eventually we shall resolve not to suffer Great Britain to be excluded from the commerce of the Levant."

**THE EUPHRATES EXPEDITION.**—This expedition which, owing to adverse winds, has been so long detained, is now fairly under weigh, the bark *George Canning* having sailed yesterday. As soon as this fine ship reaches the coast of Syria a strong detachment of the garrison of Aleppo will be marched across the desert, about eighty miles, to the town of Bir, on the river Euphrates, where additional fortification will be constructed for the protection of the artificers while putting up the two iron steamers, the *Euphrates* and the *Tigris*, and as a permanent depot for the stores. Every means will be used to conciliate the Arabs, and we trust successfully. It is only from the smaller wandering tribes that hostile opposition is to be apprehended. With the more powerful tribes, who are chiefly stationary, such arrangements will be entered into as are likely to make them comprehend the peaceable nature of the undertaking. If no untoward accident occur

there is a great probability that the steamers will be completed in time to commence the descent of the river to the Persian Gulf by the middle of May. Although the principal object of the expedition be the opening of steam communication through Mesopotamia with India, it is hoped that the officers of the departments of astronomy, geography, geology, natural history, antiquities, &c. will have sufficient time for prosecuting their researches in this new and interesting field. The result of their labors will be looked for with anxiety by the whole scientific world. The expedition is under the command of Captain Chesney, of the Royal Artillery, who was lately gazetted with the temporary rank of colonel while on this particular service in Asia, and has been long and favorably known by the public for his science and enterprise.

Officers of the steamer *Euphrates*:—Lieutenant Cleveland, R. N., of H. M. steam vessel *Phoenix*, fourth in command; Mr. Chaslewood, mate, R. N., of H. M. steam vessel *Salamanca*, eighth in command; Mr. Fitzjames, mate, R. N., of H. M. S. *Winchester*, ninth in command; one engineman and two assistants.

Officers of the steamer *Tigris*:—Lieut. Lynch, Indian navy, second astronomer, and second in command; Mr. Eden, mate, now in Syria, making preparation, R. N., sixth in command; Mr. Hector, master, late of the *El Bourka*, of the Niger expedition; one engineman and two assistants.

Scientific department:—Capt. Estcourt, 43d Light Infantry, pendulum and magnetic experimenter, third in command; Lieut. Murphy, R. E., astronomer and director of trigonometrical survey, fifth in command; Lieut. Cockburn, R. A., assistant draughtsman and surveyor, seventh in command.

Dr. Staunton, R. A., physician and naturalist. Mr. Ainsworth, surgeon and geologist. Mr. Staunton, chemist and assistant naturalist. Mr. V. Germain, draughtsman and assistant engineer.

Mr. Thomson, second draughtsman, and in charge of the chronometers.

Signor Riga, apothecary and interpreter.

Hadgi Halil, second interpreter.

By the above arrangement, there is a reserve in every department of duty and science, in case of illness or death.

The following are a few of the details of the steamers:—*Euphrates*—105 feet long; 19 beam; 2 engines, 25 horse power; weight of iron, exclusive of machinery, 23 tons, 14wt. 3qrs. 7lbs.; weight of boilers, 16 tons 6cwt. 1qr. 18lbs.; draught of water under 3 feet; weight of engine, 25 1.4 tons. *Tigris*—85 feet long; 16 beam; 2 engines, 10 horse power, weight of iron work, 14 tons 17cwt. 2qrs. 1lb.; weight of boilers, 7 tons 14cwt. 3qrs. 5lbs.; draught of water under 2 feet; weight of engine 11 1.2 tons.

The *George Canning* will probably lay in provisions at Cork, and stop a week at Malta; and, thence proceeding, land the heavy baggage, including the iron steamboat, the diving-bell, &c. up the Orontes, most likely at Antioch. A portion of the expedition, however, it is proposed, shall land at Scanderoon.

Arrived at Bir, the first object contemplated is an exploratory excursion down the river, to make friends with the Arabs, both the fixed and the wandering tribes; and examine more minutely than heretofore the general chance of success in the navigation of the Euphrates. It would then sail for Bassora or Korna; and, while the larger steam vessel was left for the purpose of keeping up and protecting the navigation of the Euphrates, the smaller one would be employed in assisting the labors in the sciences of geography and natural history, by navigating the *Tigris* and the *Kawun*. This, indeed, must be the most novel and interesting episode connected with this very important enterprise.

**THE FINEST PEASANTRY ON THE FACE OF THE EARTH.**—Again we have to record another of those barbarous murders that disgrace this country. Some time since a Black visited the neighborhood of Carnacon, and occasionally kept a boxing school, to which the young men about the place resorted for instruction. Two of these, Walsh and Byrne, had been sparring, and Byrne

knocked Walsh down and indiscreetly boasted of it. Walsh for this felt offended, and on Christmas day, in presence of many persons, required satisfaction for the offence by fighting him on the spot. Both took off their coats and were about to engage, when a man named Peter Staunton, about twenty-two years of age, came between them, and endeavored to prevent the quarrel, as they were all friends and nearly related. While performing the kind office of peace-maker, he was struck behind on the head with a stick by Walsh's brother Paddy, and instead of resenting this, he turned round, shook hands with him, and kissed him, and said he would never strike him in return. Walsh then struck him again. Some rioting after this took place, and Staunton and some others with him attempted to escape through a potato field, when he was knocked down by another man named Staunton, with a stone, into the furrow, where he lay unable to rise, and there, while on the ground, was struck with a long stone in the head by J. Walsh, the man whom he before attempted to save from being hurt. He was also struck twice on the side with a pair of tongs by one Kilcoyne. On examination it was found that his skull was severely fractured, and his body otherwise injured. An inquest has been held and warrants issued for the apprehension of those concerned.—[Mayo Constitution.]

**FAULTS OF THE EAR.**—It is extraordinary what an effort nature makes upon the loss of sight to restore the deficiency by sharpening the sense of hearing and touch; as in the case of Huber the great naturalist, who has made so many discoveries in the minutiae of insects; and also of Mr. Goff, of Kendal, an eminent botanist, who can tell the name or species of any plant or flower by the touch. Dr. Darwin informs us, in his Zoonomia, that the late Justice Fielding walked for the first time into his room, when he once visited him, and after speaking a few words, said, "this room is twenty-two feet long, eighteen wide, and twelve high," all of which he guessed by the ear. Blind people have a peculiar method of presenting the ear, and in some cases acquire the power of moving it when much interested. The incessant use they make of it gives them an indescribable quickness; they judge of every thing by sound; a soft somorous voice with them is the symbol of beauty; and so nice a discernment is a blind person of the accents of speech, that through the voice he fancies he can see the soul. Sir John Fielding possessed a great faculty of this sort; and he could recollect every thief that had been brought before him, by the tone and accent of his voice, for more than forty years.—[Gardiner's Music of Nature.]

**BILLETS DE PART.**—Whenever a birth happens in families of gentility, it is usual to send notes to the friends, apprising them of the event, the sex of the child, and the state of its health, and of its mother's. The same formality takes place upon a death, when the note indicates the day, hour, and place of funeral; again, in the case of a wedding, two printed circulars are sent together in the name of the parents of each party, to the respective friends of both families. The most intimate friends are invited to the wedding entertainments, whilst the more distant acquaintances are merely invited to be present at the marriage ceremony at the church. These notes and circulars bear the common name of *billets de part*, and those announcing a marriage, announcing a marriage, answer to the bride's cake of the English, with this distinction, that the latter are sent after the wedding, while the former indicate when the ceremony is to take place.—[Le Mariage en France.]

**THEATRICAL COLORED FLAME.**—The Journal des Connaissances Usuelles, gives the following processes for producing various colored flames at theatres; flame of a red tinge, like carmine, is produced by burning three parts of alcohol with one of nitrate or hydro-chlorate of strontium. Red, the same proportion of cinnabar and alcohol; sulphate of soda with alcohol will produce the same light at a less intensity.—Orange color is obtained by the combination of alcohol with hydro-chlorate of calcined soda.—Yellow, by alcohol, and nearly all the hydro-

chlorates, in proportion of one of the first to three of the last. An emerald green, with alcohol and nitrate of copper; green, with alcohol and hydro-chlorate of copper; blue, with alcohol and boracic acid.

M. Dupuytren died in Paris on the 8th of February, after a lingering illness of several months, aged 57. He has left the reputation of being the first operating surgeon in France, and probably in Europe. Domestic affliction preyed upon his mind for the last few years of his life. He has left Madame Beaumont, his only daughter, a fortune of nearly 7,000,000f., besides a legacy of 200,000f., to found a chair of medico-chirurgical pathology. He has also left 100,000 crowns, to found an asylum for twelve aged physicians.

#### SUMMARY.

**THE RIVER.**—The Albany Evening Journal of Tuesday says, "the river is nearly free of ice. A sloop has arrived at Hudson."

**KENNEBEC ROAD.**—This road is now travelled over by very many persons, and we have observed lately a number of the American winter sleighs and carioles in town. The Maine papers and private accounts represent the timber business on the Kennebec and the adjoining streams as the most active for many years past. The demand for hay and oats a little beyond our lines is almost unlimited, and much of it has been supplied by our Canadian habitants at 20 dollars a hundred, and 2s. 6d. a bushel. The demand for lands for settlement on the American side is also very great and the spirit of enterprise which the people of Maine display in advances towards us, is astonishing; a few years must make the route of communication quite frequented, and give Quebec a very expeditious intercourse with the whole of the States and Europe.

[From the Quebec Gazette.]

The troops frequently visit the ice on the St. Lawrence. This afternoon, the Royal Artillery had a *field day* on the ice, with four pieces of artillery, on sledges, going through a number of rapid evolutions with their guns, firing blank cartridge with great despatch, and affording an excellent idea of the manœuvring of artillery on the field of battle.

**Saluting an Earthquake.**—We mentioned a day or two since, that an earthquake was felt at Omoa, (Central America,) on the 22nd and 23d of January. It was occasioned, as we learn from the Boston Transcript, by an eruption of a mountain, east of Omoa—supposed to be the Congre-hoy. The noise was like the sound of distant cannon and continued 18 hours. It was heard at the Belize, Honduras, 200 miles distant, and was answered by a salute from the fort, supposing it to proceed from a man-of-war outside the Keys.

**HARD TO BEAT.**—We are informed that a female in the lower part of Virginia, has given birth to seven children within the last ten months, four at one birth and three at another.—[Rich. Va. Compiler.]

If this prolific mother was of that complexion, "incompatible with freedom" what a treasure she would be deemed.

[From the Baltimore American of yesterday.]

**STEAMBOAT EXPLOSION.**—The opening of the steamboat navigation on the Western waters for the present season has already been marked by the occurrence of an explosion and loss of lives. Nothing short of the enactment of a law by Congress, with the strictest regulations and heaviest penalties, can effectually prevent the risk and loss of life and property to which they appear to be especially subject in that quarter of the country.

The Cincinnati Republican of the 9th inst. states "that the steamboat CAVALIER, Captain Thompson, burst one of her boilers, on her passage from New Orleans up the Mississippi, about one hundred miles below the mouth of the Ohio, where she now lies. Mr. Patterson, the clerk, who was standing upon the boilerdeck, was thrown up several feet and landed on the shore with two of his ribs broken. Capt Thompson was confined to his state room by sickness, and

escaped uninjured. The 1st Engineer died a few hours previous of the small pox. Several persons were injured, and, we learn, two more killed. The boat belonged to Ripley, in Ohio, owned in part by the captain and clerk: both very deserving, industrious and enterprising men. The crew have been brought to Cincinnati by the Wyoming, captain Holton."

The Legislature of Ohio adjourned on Monday the 9th—after a session of 14 weeks.

The American schooner Sophronia, Amos Chick, master, from Charleston, South Carolina, laden with pitch-pine lumber, rice and oats, and bound to Martinique, during the strong gale and hazy weather of Friday, struck on the North-west breakers, bilged, and filled immediately.—The Crew and part of the cargo were landed at Mangrove bay, and the hull of the vessel was being towed in yesterday, by four of the Somerset Pilot Boats.

The brig Enterprise, Smith, master, of this port, with a cargo of slaves, from Alexandria, in the District of Columbia, destined to Charleston, South Carolina, after being blown off the coast, put into Bermuda, where the slaves were brought up on *Hobbes's Corps*, and liberated.

The Bermuda papers state that they all had been provided for as servants in families.

**AMERICAN TRADE WITH CHINA.**—This trade during the last two or three years, has been rapidly increasing. We have before us a list of the vessels which arrived in China under the American flag, and departed therefrom, during the year ending June 30th, 1834. The whole number is seventy-nine. Of these 33 sailed for New York, 13 for Manilla, 9 for Batavia, 6 for Philadelphia, 4 for Boston, 3 for Valparaiso, 4 for Cowes, 1 for Lima, 1 for Baltimore, 1 for Salem, 1 for the Texel, 1 for Hamburg, 1 for Kamtschatka, 1 for Norfolk Sound, 1 for the United States (port not specified,) 1 for South America (port not specified.)—[Journal of Commerce.]

The number of vessels which arrived in the port of Buenos Ayres during the year 1834 from foreign ports, was 261, of which 67 were American (in 1833, 91,) 61 British (in 1833, 74,) 43 Brazilian, 43 Sardinian, 14 Hamburg, 10 French, 5 Bremen, 5 Danish, 4 Portuguese, 2 Neapolitan, 2 Dutch, 2 Belgian, and of Russian, Chilian and Roman, 1 each.

**FROM BERMUDA.**—By the brig Neptune from Bermuda, we have the Bermuda Gazette of 3d instant. The following are extracts:

**The Rhadamanthus, Steam Frigate.**—This vessel having made a longer stay here than was expected on her arrival, has given very many an opportunity of visiting her; and the attention of Captain Evans, and his officers, has added much to the pleasures attendant on such an inspection. To those who have not had an opportunity of viewing the Rhadamanthus, we subjoin a few particulars of her dimensions as well as of her machinery, to assist them in forming some idea of the size, power, &c. of this splendid vessel.—The Rhadamanthus has now been from England about nineteen months, and her officers speak in the highest terms of praise of her qualities as a sea boat and fast sailer.

Length	165 feet.
Breadth inside of paddle-wheels	46 "
Tonnage	813
Engine Horse power	220
Paddle-Wheel, diameter	21 feet.
Boilers hold	50 tons.
Coals	390

and consumes on an average when in full power, one ton per hour, and is propelled by every turn of the paddles half a mile; the wheel revolves usually about 18 times per hour.

Armament—6 guns.—1 34 lbs long gun on the fore-castle—1 32 long gun aft.—2 32 short on each gangway.

A Sloop of War's Complement of men.—4 Engineers and 16 Stokers.

Samuel T. Armstrong, who has been elected several years Lieut. Governor of Massachusetts, and is now acting Governor, declines a re-election.

**BOUNDARY QUARREL.**—Ohio and Michigan, the one a State, the other a Territory, have a dispute about the boundary which separates the north part of Ohio from the South part of Michigan.—Ohio claims to run a line from the South point of Lake Michigan, direct to Lake Erie. This would include the whole of the Maumee Bay, and its surrounding rich lands. These, heretofore, we believe, have been in possession of Michigan. The Legislature of Ohio has ordered its Governor to take possession of those lands. Michigan says she will resist, and—according to the United States Gazette, of Philadelphia—"a law is published, enacted for the occasion, which renders it criminal for any one to hold any office in that territory, or in any part of it as it is now constituted, unless he is appointed by the authorities of that territory, or of the United States. The acting Governor has also given directions to Brigadier General J. A. Brown, to proceed into the disputed territories, and there ascertain whether any officers are holding commissions under the new movement of Ohio, and if so, immediately to enforce the act against them, calling to his aid the *posse comitatus*, if necessary. The acting Governor remarks, that there is but one feeling in Michigan, and that is decidedly against Ohio. Of course his Excellency means out of the disputed territory. In obedience to instructions from the Executive, General Brown announces that the crisis anticipated has arrived, and accordingly he orders out three brigades, and gives notice that if there is an officer in them who is not willing to peril "life, fortune and honor" for the territory, he is at liberty to give up his commission. These general orders conclude with the expression of a determination never to submit quietly to the invasion of their soil, whatever force Ohio may bring against them.

General Brown attended a public meeting held in the disputed territory, and was very roughly received. The meeting refused to hear him and his instructions, though subsequently, those of the meeting who were friendly to the authorities of Michigan, organized themselves, listened to General B. and passed a resolution approving the proceedings of the executive. This is the present situation of the dispute between the *sovereign* State of Ohio, and the appanage, Michigan.

**COMMERCE OF NEW YORK.**—The amount of duties which accrued at the port of New York, during the year 1834, was \$10,183,152

Amount of value of Imports for same period,	76,875,365
Value of do. for 1833,	60,944,400

Excess in 1834,	\$15,943,965
-----------------	--------------

Showing an increase in the amount of goods imported at this port, of more than 25 per cent. in one year, and that a year of unusual mercantile embarrassment.

**Condition of the Ohio Banks, January, 1835.**

Capital Stock,	\$12,200,000
Capital paid in,	5,847,525
Specie,	2,489,912
Circulation,	4,564,898
Discounts,	6,799,247
Circulation over \$5,	3,382,321
Circulation under \$5,	1,182,577

The whole number of Banks in the State is twenty-seven. The largest capital is that of the Ohio Life Insurance and Trust Co., which is two millions of dollars. The Commercial, Franklin, and Lafayette Banks, all at Cincinnati, have capitals of one million each. Several others have capitals of half a million, and several of one hundred thousand dollars.

**Specie.**—The Globe states that the whole amount of specie imported into this country

since October, 1833, is \$24,428,594. Exported in the same time, \$3,000,000.

**NAVAL.**—The United States Frigate Constitution, Commodore Elliot, sailed on Sunday morning.

List of Officers attached to the United States Frigate Constitution:

Commodore J. D. Elliot, Commander.  
Lieutenants—J. B. Montgomery, F. Ellery, W. C. Nicholson, E. C. Rutledge, G. F. Pearson, F. E. Neville, L. M. Powell.  
1st Lieut. Marines, J. H. Hardy.  
2d do. do. Thos. T. Stone.  
Surgeon, T. J. Boyd.  
Assistant Surgeon, I. Brinkerhoff, R. Woodworth.  
Purser, H. Etting.  
Chaplain, J. Everett.  
Master, J. Ferguson, Second Master, J. M. Berrin.

Passed Midshipmen, J. F. Duncan, C. Steedman, J. W. Rave, J. W. Cook, W. T. Muse, J. L. Henderson.

Midshipmen—G. T. Sinclair, G. W. Randolph, R. N. Maffit, T. Oakes, B. F. Shattuck, W. S. Parkinson, E. C. Anderson, S. D. Trenchard, E. E. Rodgers, R. H. Jenkins, J. B. Lewis, T. S. Haggerty, J. H. Tilghman.

J. E. Dow, Schoolmaster.  
J. H. Prince, Captain's Clerk.  
Geo. C. Thomas, Purser's Clerk.  
Boatswain, W. Hart.  
Carpenter, J. A. Dickson.  
Gunner, T. Riley.  
Sailmaker, N. C. L'Hommiedieu.

**VICE CONSULS OF PORTUGAL.**—The President has recognized John Vaughan, of Philadelphia, and Luis F. de Figanieri, of New York, as Vice Consuls of Portugal for those ports respectively.

**Liberality.**—The death of John Stocking, Jr. Esq., Mayor, of Mobile, was mentioned some days ago. He was a much esteemed magistrate and citizen, but died leaving a large family without property. A subscription was started for their benefit by some generous individuals, and in a short time four thousand dollars was pledged upon it, and other sums were expected.

There are now between seven and eight hundred slaves, offered by their owners, in various States of the South and West, to the American Colonization Society, for liberation and removal to Liberia, if the Society had the means of sending them. Unfortunately it has not. Cannot the benevolent and patriotic of this opulent nation furnish the means? Let the appeal be made, and we are sure they will.—[National Intelligencer.]

Captain King, of the schooner Despatch, arrived last evening from Omoa, states that a severe shock of an earthquake was felt at that place on the 25th January. An Indian village, about fifty miles from Omoa with all its inhabitants, was destroyed, with the exception of four men, who were up in the mountains. Capt. K. was one hundred miles distant at the time, and heard the report like a cannon. The ashes fell to the depth of an eighth of an inch on the deck of the schooner.

[From the New Orleans Bee, Feb. 26th.]

**FROM MEXICO.**—By dates from Mexico, the 2d instant, we have received advices of the resignation of Santa Anna of the chief magistracy of the Mexican republic. The Congress having nominally accepted his resignation, they ordered the election of President for a subsequent day; and elected General Miguel Barragan, President during the interval—through the influence of Santa Anna. By a third decree of the Congress, the office of Vice-President was declared null; so that Gomez Farias was obliged to resign.

It is not unlikely that at the election for President as decreed, Santa Anna will be elected perpetual chief magistrate, or dictator, of the fallen republic. There does not appear to be sufficient intelligence in Mexico to warrant a republican form of government. Liberty never existed where knowledge did not prevail.

## VARIETIES.

From late Foreign papers.

**Steam navigation, by Austrian vessels, has commenced between Trieste and Constantinople, touching at Corfu, Nauplia, Smyrna, and the Dardanelles, from which latter place to the capital the voyage is completed in from 14 to 18 hours. A vessel of 120 horse power is building at Liverpool, for the enterprising house of Chalton, Whittall, and Co., British merchants at Smyrna.**—[Hampshire Telegraph.]

**INTERIOR OF AFRICA.**—In a lecture delivered by Captain McConochie at the London University last week, he made the following observations:—"It has been ascertained that some of the nations of the interior of Africa were comparatively in a state of civilization, and that the Governments under which they existed were stable.—Lines of investigation had, by the expeditions of various travellers, been marked out on the tract now sought to be more fully explored, from the east, the west, and the south; it was an expansion of those lines that was required; it was breadth in the future researches that must be given to those lines, and the angles contained between them must be filled up. The continent of Africa had already been penetrated 1400 miles north from the Cape of Good Hope. The countries farther north were found to be the furthest advanced in the art of civilized life. At the distance of 1400 miles from the Cape the arts of smelting iron and copper, and of carving in ivory, were known. Commerce had penetrated in that direction nearly 1400 miles, and a trade to the amount of £1600 had been carried on in one expedition, though under the disadvantages of the commodities of the trading having been conveyed in wagons, and not by water."

**CIVILIZATION AND CHAMPIONSHIP OF ENGLAND.**—The discussions respecting this pugilistic dignity have been lately revived in the sporting circles. Some time ago Ward, the present nominal possessor, was challenged by a well known character, Deaf Burke, to sustain his pretensions to the honor. An offer was made to stake £200, besides the right to the title on the issue of the contest, and Ward at first consented; but afterwards refused to enter the lists unless the sum were raised to £300, and on that being agreed to, unless it were made £500—a sum which Burke was unable to collect. This conduct of Ward was by some considered capricious, and by others pusillanimous; so that at a late meeting upon the subject, a resolution was unanimously carried to the effect that the maximum stake in such a contest should be £200, and that if Jem Ward refused to come forward on these terms, Burke should assume the title of Champion of England.—[London paper.]

**NATURAL HISTORY.**—In a paper read before the Academy of Science at Paris, by M. F. Cuvier, on the growth of feathers, hair, and the quill of the porcupine, among a variety of curious information it was remarked that the hair of certain animals, though not, as has been supposed, a part of the skin, has a very acute sense of touch, as in the cat; for it was observed, if the smallest particle of dust fall on the fur of this animal, it is immediately sensible of it, and endeavors to shake it off.

**PRINCESS DE CHIMAY.**—The Princess de Chimay, formerly Madame Tallien, so celebrated for her beauty, and the part she played during the first French revolution, died on the 15th of January at her chateau at Chimay. She was born in Spain, and the daughter of M. Gabarus, who was twice Minister of the Finances of that country. Before the Revolution she had married M. de Fontenay, a Councillor in the Reuen Parliament. In 1789, she enthusiastically embraced the prevalent Revolutionary opinions.—On passing through Bordeaux, subsequently to the memorable 10th of August, she was arrested, but the celebrated Member of the Convention, Tallien, being in that city, she captivated him by her beauty, and through his interposition was released. On returning to Paris, she was again thrown into prison, and only restored to liberty in 1794. It was then she became known under the name of Madame Tallien, and acquired that fame which she long retained. On Tallien's

departure for Egypt, Madame Tallien remained in Paris, where she was surrounded with worshippers. Among them was Barras, Member of the Directory, through whose credit, it must ever be said to her honor, she nobly rendered innumerable service to the victims of the Revolution, by whom she was gratefully called *Notre Dame de bon Secours*. She was often a rival of Josephine Bonaparte, but never could obtain the slightest access to Napoleon's good grace. When Tallien returned, she refused to receive him, and declared that all ties with him were severed. In 1805 she married M. de Caraman, who in 1815, assumed the title of Prince de Chimay.

The *bourgeoisie*, and substantial citizens generally, begin to complain of the *exclusiveness* of Louis Philippe's entertainments. At first the *Citizen King* used to make his invitations very general; but lately at a grand concert at the palace, none but nobles, and now and then a few deputies, were to be seen.

The *Tribune* was again seized and suppressed for the 107th time, on 5th February—not as was said for a biographical article on M. Argout, but for certain statements relative to an alleged arrangement made by Gen. Bernard in New York, on the subject of the 25 million indemnity.

MUSIC makes its nobles we find; for Bellini, for his new opera of the *Puritani* has received the decoration of the *legion of Honor*.

MEYER-BER, has recently been elected a foreign associate of the *Academie des Beaux Arts* and the King had approved the choice.

We have before us, says a Paris paper, the *Royal Almanac* of Spain for 1835, and find in the list of the *Grand Croix* of the order of *Isabella the Catholic*, the name of M. Rothschild. This dignity confers on whoever is invested with it, the title of *Most Excellent*. Hitherto M. Rothschild has been very silent in Paris about this new favor from *Maria Christina*—a favor conferred upon the eve of his paying several millions at any rate, the admission of an *Israelitish* capitalist into the *Catholic* order of *Isabella*, is a proof of the progress of ideas in Spain, and especially of the irresistible progress of the power of money, over the most inveterate prejudices in the habits of a nation.

The following statement characterizes at once the horrors of the civil war in Spain, and the virtues which such scenes sometimes call into play:

Lately, near Hernani, a Carlist party captured about forty persons, men and women, who were going to St. Sebastian with provisions. In conformity with the orders of Don Carlos they should all have been shot, but the Chief who took them, contented himself with ordering the execution of seven only out of the party. Four men and three women were designated by lot. One of the women had three children at home. She obtained permission, before dying, to see her family, which was near by. After a brief interview with them, her husband, deeming that she, better than himself could provide for their children, offered to take her place as the victim, was accepted, and with the other six—shot!

MR. CORBETT'S ACCOUNT OF HIS ELECTION.—The election over in an hour and three quarters in the whole! And everything so well, so sensibly, so every way nicely conducted, I never saw before. The returning officer, James Lees, Esq. just as polite and amiable looking a young man as can be imagined. Mr. Fielden was proposed by Mr. Joshua Milne, and seconded by Mr. John Travers. I was proposed by Mr. Alexander Taylor, and seconded by Mr. Hague. Here was sense. We had no placards; we had no address; we asked no man for a vote; we did not ask the collective body. We had nothing of expense of any sort even for our own personal entertainment. Here was no nonsense; no flattery; no coaxing; no

bombast; nor was there any nonsense about "stop-ping the supplies." "We told our constituents that it was their duty to feel grateful to the King for what he had done; and that it would be our duty to take care to avoid every thing tending to thwart his servants, if they appeared to be disposed to act in conformity to the good of his people; and that nothing, we are resolved, should induce us to give our countenance to any factious proceeding, having for its object to lessen the constitutional weight and authority of the King or of the Lords. In all which we had the hearty concurrence of our constituents."—[Political Register.]

NEVER DESPAIR.—A recent London paper gives this account of a whole crew saved by the energy and example of the commander.

In the Mangles from China came passenger Capt. Theaker, of the late ship *Earl of Eldon*, which was destroyed at sea, by her cargo of cotton igniting, when on her passage from Bombay. The Captain's conduct affords a striking proof of what may be effected under the most distressing privations and difficulties, by skill and self-possession. In the midst of the Indian Ocean, he safely conducted the crew and passengers, amounting in number to forty-five persons, in two boats (one a long boat about 22 feet by 7 feet, loaded to the water's edge with thirty-five persons, bread, water, provisions, chart, compass, &c., the other, a jolly-boat, containing 10 persons,) across a space of the Indian Ocean of nearly 1,050 miles, weathering two storms, and in 13 days carried them into port (Port Louis) without the loss of a single life, or any real extremity of suffering beyond that inseparable from their situation.

ORIGIN OF THE WORD QUIZ.—Very few words ever took such a run, or was saddled with so many meanings, as this monosyllable; and, however strange the word, 'tis still more strange that not one of our lexicographers, from Bayley to Johnson, ever attempted an explanation, or gave a derivation of it. The reason is very obvious. It is because it has no meaning, nor is it derived from any language in the world ever known from the Babylonian confusion to this day. When Richard Daly was patentee of the Irish theatres he spent the evening of a Saturday in company with many of the wits and men of fashion of the day: gambling was introduced, when the manager staked a large sum that he would have spoken, all through the principal streets of Dublin, by a certain hour next day, Sunday, a word having no meaning, and being derived from no known language—wagers were laid, and stakes deposited. Daly repaired to the theatre, and dispatched all the servants and supernumeraries with the word "Quiz," which they chalked on every door and every shop window in town.—Shops being shut all next day, every body going to and coming from their different places of worship saw the word, and every body repeated it, so that "Quiz" was heard all through Dublin; the circumstance of so strange a word being on every door and window caused much surprise, and ever since, should a strange story be attempted to be passed current, it draws forth the expression—you are quizzing me.

EXTRAORDINARY SUICIDE IN FRANCE.—A dashing young man, who frequented the best society, conceived the design of committing suicide, which he executed in the following singular manner, a few evenings since:—After having arranged himself in full dress as for an assembly, he lighted six tapers, and placed them in order round his bed, and near the latter was a pan of charcoal. The deluded man gaily said to his neighbors, that he was about to take a long voyage, and immediately entered his room, which he was to leave no more alive. The fatal charcoal was ignited, and, in two hours he was found lifeless.—[Galignani.]

#### PATENT HAMMERED SHIP, BOAT, AND RAILROAD SPIKES.

Railroad Spikes of every description required, made at the Albany Spike Factory. Spikes made at the above Factory are recommended to the public as superior to any thing of the kind now in use. Ship and Boat Spikes made full size under the head, so as not to admit water.

Orders may be addressed to Messrs. ERASTUS CORNING & CO., Albany, or to THOMAS TURNER, at the Factory, Troy, N. Y. Sept. 13 1y

#### RAILWAY IRON.

95 tons of 1 inch by 1 inch,	Flat Bars in lengths of
200 do. 1 1/2 do. do.	14 to 18 feet, counter sunk
40 do. 1 1/2 do. do.	holes, ends cut at an angle
800 do. 2 do. do.	of 45 degrees, with splicing
600 do. 2 1/2 do. do.	plates and nuts to suit.

soon expected.

2350 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 24, 28, 30, 32, 34, and 36 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment. A. & G. RALSTON.

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them. d11m-cw

#### PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keeps constantly on hand a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent), are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1831.

Spikes are kept for sale, at factory prices, by I. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. I. Brower, 222 Water street, New York; A. M. Jones, Philadelphia; T. Janvier, Baltimore; Degrand & Smith, Boston.

P. S.—Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes. 132am H. BURDEN.

#### SURVEYING AND ENGINEERING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new, among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG, Mathematical Instrument Maker, No. 9 Dock st., Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested. Baltimore, 1832.

In reply to the inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad, I cheerfully furnish thee the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend, JAMES F. STABLEY, Supt of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer. Germantown, February, 1833.

For a year past I have used instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad. Germantown and Norristown Railroads

## METEOROLOGICAL RECORD,

Kept at Asa's Ferry, Red River, Lou. (Lat. 31.10 N., Long. 91.59 W., nearly.)

Agricultural & Mechanical  
REPOSITORY,

AND OFFICE OF THE

NEW-YORK FARMER,  
MECHANICS' MAGAZINE,

AND

RAILROAD JOURNAL,

No. 35 Wall street, New-York, and  
96 North Pearl street, Albany.

Where may also be had the

AMERICAN MONTHLY MAGAZINE,

RAILROAD AND CANAL MAP,

QUARTERLY JOURNAL OF AGRICULTURE,  
MECHANICS, AND INTERNAL IM-  
PROVEMENTS,

PUBLIC DOCUMENTS,

EULOGY ON LA FAYETTE.

**RAILROAD AND CANAL MAP.**  
THIS long promised Map is now ready for those who wish it. Its size is 94 by 40 inches. It is put up in a convenient pocket form, in morocco covers, and accompanied by over 70 pages of letter press, giving a concise description of, or reference to, each Road and Canal delineated on the Map. It will also be put up in *Marble Paper* covers, so as to be forwarded by mail to any part of the country; the postage of which, cannot exceed 44, and probably not 25 cents, to any part of the country.

Published at 35 Wall street, N. Y., by  
D. K. MINOR.SUPERIOR  
GARDEN AND AGRICULTURAL SEEDS.

The Subscriber has now on hand a full supply of Garden and Field Seeds, growth of 1834; among which are all the finest cabbages, cauliflower, brocolie, radishes, peas, &c., that are cultivated in England, France, and Holland, together with every sort that can be raised to advantage in our own country, and which are grown expressly for my use from stock furnished and raised by the most experienced gardeners in this country; in short, every article emanating from my store I warrant genuine and fresh.

Also, skinkless oats, potatoe oats, 44 lb. weight to the bushel, perennial rye grass, white clover, lucerne or French clover, orchard grass, Herd's grass, white mulberry, and yellow locust seeds, spring tares or vetches, genuine mangel wurtzel, and ruta bags, and field turnip, seeds well worth the attention of farmers.

Canary, Hemp, Rape and other bird seeds; wholesale dealers supplied on accommodating terms. Price lists by the pound and bushel furnished on application, as also catalogues of whole collection.

The flower seed department embraces the choicest variety to be found in this country, in which are included choice double Dahlia seed, carnation and choice Pinks, German and China Asters, splendid double balsam, with an addition of several new varieties, accompanied with a printed direction for culture and management.

Orders will be punctually attended to and carefully packed and forwarded as directed, but as the collection of distant debts are often troublesome and sometimes impracticable, it is desired that satisfactory reference be made to persons in Albany, when the order is not accompanied with the money.

W. THORNBURN,  
347 N. Market st. (opposite Post Office.)

\* \* Mr. Thornburn is also Agent, and will at all times receive subscriptions, for the *NEW-YORK FARMER* and *American Gardener's Magazine*; *QUARTERLY JOURNAL OF Agriculture, Mechanics, and Manufactures*; *MECHANICS' MAGAZINE* and *Register of Inventions and Improvements*; and the *AMERICAN RAILROAD JOURNAL* and *Advocate of Internal Improvements*; published at No. 35 Wall street, N. Y., by D. K. MINOR. F—Feb 11

## AGENTS FOR NEW PUBLICATIONS.

HENRY G. WOODHULL, of Wheatland, Monroe county, New York, is agent for the following Publications:  
The *New York American Daily*, at \$10.00—Tri-Weekly, at \$5.00—Semi-Weekly, at \$4.00 in advance.  
The *American Railroad Journal*, Weekly, at \$3.00 per annum.  
The *Mechanics' Magazine*, two volumes a year, at \$3.00 per annum.  
The *Quarterly Journal of Agriculture and Mechanics*, at \$5.00 per annum, or \$1.25 per number.  
The *Family Magazine*, 116 pages a year, at \$1.50 in advance.

The *Monthly Repository and Library of Entertaining Knowledge*, of 36 pages a month, at \$4.00 in advance, now in the 5th volume, bound volumes \$1.25.

The *Ladies' Companion*, of 54 pages a month, at \$3.00 per annum, in advance.

The *Rochester Gem*, at \$1.50 in advance.

All Communications addressed to me, at Wheatland Monroe county, will be promptly attended to. September 19, 1834.

September 19, 1834.

## RAILROAD CASTINGS.

MANY & WARD, Proprietors of the Albany Eagle Air Furnace and Machine Shop, will make to order car wheels, chairs and knees, and every other description of castings required for railroads. E—ly Feb 16

## SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by

E. & G. W. BLUNT, 164 Water street,  
corner of Maiden lane.

## STEPHENSON,

Builder of a superior style of Passenger Cars for Railroad, New-York.

No. 264 Elizabeth street, near Bleeker street,

New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad now in operation. J36 tf

RAILROAD CAR WHEELS AND BOXES,  
AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to.

Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM &amp; GROSVENOR.

## NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Landingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Landingburgh. August 15, 1835. A29 tf R M & F

## MILL DAM FOUNDRY FOR SALE,

The Proprietors of the Mill Dam Foundry offer for sale or lease their well known establishment, situated one mile from Boston. The improvements consist of

No. 1. *Boiler House*, 50 feet by 30 feet, containing all the necessary machinery for making boilers for Locomotive and other steam Engines.

No. 2. *Blacksmith's Shop*, 50 feet by 20, fitted with cranes for heavy work.

No. 3. *Locomotive House*, 54 feet by 25, used for putting together Locomotive Engines. Several of the best Engines in use in the United States have been put in this establishment.

No. 4. A three story brick building, covered with slate, 120 feet by 46, containing two water-wheels, equal to 40 horse power; Machine Shop, filled with lathes, &c.; Pattern Shop; Rolling Mill and Furnaces, capable of rolling 4 tons of iron per diem, exclusive of other work; three Trip Hammers, one of which is very large; Engine for blowing Cupola Furnaces, moved by water-wheel; one very superior 18 horse Steam Engine, which could be dispensed with; and a variety of other machinery.

No. 5. An Iron Foundry, 50 feet by 45, with a superior air Furnace and two Cupolas, Core oven, Cranes, &c. fitted for the largest work. Attached to the Foundry is a large ware-house, containing Patterns for the Castings of Hydraulic Presses, Locomotive and other Steam Engines, Lead Mill Rolls, Geerlag, Shafts, Gears, Grates, &c. &c. These were made of the most durable materials, under the direction of a very scientific and practical Engineer, and are supposed to be of great value.

No. 6. A building, 65 feet by 36, containing a large stock of chimneys, and furnaces, for making Cast Steel. This building is at present used as a boarding-house, and can accommodate a large number of men.

No. 7. A range of buildings, 200 feet long by 36, containing counting room, several store rooms, a Brass Foundry, room for cleaning castings, a large loft for storing patterns, stable for two horses, &c. &c.

The above establishment being on tide water, presents greater advantages for some kinds of business than any other in the United States. Coal and iron can be carried from vessels in the harbor of Boston, to the wharf in front of the Factory, at 25 to 30 cents per ton. Some of the largest jobs of iron work have been completed at this establishment; among others, the great chain and lift pumps for freeing the Dry Dock at the Navy Yard and Charleston.

The situation for Railroad work is excellent, being in the angle formed by the crossing of the Providence and Worcester Railroads. The Locomotive "Yankee," now running on the latter road, and the "Jonathan," purchased by the State of Pennsylvania, were built at these works. With the Patterns and Machinery now in the premises, 12 Locomotives and as many tenders, besides a great quantity of cars and waggons, could be made per annum.

For terms, apply to  
THOS. J. ECKLEY, Treasr. &c., Boston, or to  
ROBERT RALSTON, Jr., Philadelphia.

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, MARCH 28, 1835.

**AVERY'S ROTARY STEAM ENGINE**—*applied to a Locomotive.*—We were much gratified, yesterday, with an excursion to Newark, on the Railroad, the cars being drawn a part of the way by Mr. Avery's Rotary Engine.

This is the first, and we are highly gratified to know that it has proved an entirely successful application, of this ingenious, yet exceedingly simple engine, to Railroad uses. Mr. Avery had, for near two years, one of these Engines in successful operation in his machine shop at Syracuse—which proved to his entire satisfaction that it might be applied to other purposes; and with a perseverance worthy of the success which has crowned his efforts, he has devoted himself to the construction of a Locomotive Engine, which is now in use on the Newark Railroad, performing that part of the route only between the Hackensack and Newark. There being no revolving platform at Jersey City, it does not yet run through the whole line.

Mr. Avery is unfortunate in the road on which he makes his first trial. A straight and smooth road is necessary in order to attain a high velocity; but the Newark road, unfinished as it is, and in some places more or less affected by frost, with one or two very short curves, will not admit of the speed which this engine is capable of attaining. On returning from Newark, however, we noted the time of starting from the

east side of the Passaic bridge—where the engine was stopped, in consequence of having parted the fast by which it was connected with the car,—and of arriving at the revolving platform, within a few rods of the Hackensack, called  $4\frac{1}{2}$  to 5 miles, which distance was performed in a fraction less than eleven minutes.

This Engine is an *experiment only*. It is the first and *only* effort to apply it to such purposes, and under all the disadvantages of poor wood, and a road much in want of adjustment, it may be considered as a highly successful experiment.

When Mr. Avery shall have completed another and more powerful engine, which he has now in course of construction, designed to test the principle more effectually, on a more perfect road, we doubt not of his attaining a *greater* velocity than has ever yet been attained in *this* country—or even in Europe—we shall probably be deemed "Rotary Engine mad," when 40 miles per hour is named as not of difficult attainment.

With true Yankee enterprise, Mr. Avery and his associate, Capt. Lynde, are determined to carry the war into the enemy's camp, by taking one of their engines, complete and ready for use, to England.

This engine, though very simple in its construction, can be much more clearly described with engravings, which we expect soon to receive, and therefore we omit a particular description for the present.

Annexed, however, is a short account of the performance of one of the small sized engines built by Mr. Avery, which we obtained when on a visit to Syracuse last fall, and saw the whole in operation.

The Engine, that is, the shaft and arms, weigh, as I learn, only 15 lbs.; the arms from centre of shaft to their ends are 19 inches, and in their revolutions describe a circle of 9 feet 5 inches in circumference; the two apertures at the end of the arms are equal to the eighth part of a superficial inch, and under a pressure of 80 lbs. to the square inch, will balance a weight of 10 lbs. From some experiments made, it is

estimated to carry a load of 8 pounds through a space of 37,000 feet per minute. The boiler has 60 feet surface exposed to the fire, and consumes daily  $\frac{1}{2}$  a cord of soft dry wood.

There is in the establishment the following machines in operation, viz: 2 large Engine Lathes; 2 small do. do.; 2 Hand Lathes; 1 Boring Mill for boring Cylinders; 2 Drilling Lathes; 1 Grindstone; 1 Mill for grinding Coal; 2 Bellows, 40 double strokes each per minute, which will force 560 cubic feet of air per minute, under a pressure of  $1\frac{1}{2}$  lbs. per square inch.

The Engine had been in operation about 18 months, during which period it did not stop one hour in consequence of the operating part being out of order.

We hope, and expect, soon to be able to exhibit one of these Engines in operation, in printing the *Railroad Journal*, and both sides of the sheet, at the same time, or before it comes from the press—and shall be happy to show it to our subscribers, and others (of course we mean those who pay in advance,) and do us the favor to call about the first of May next.

THE NEW-YORK AND ERIE RAILROAD bill, we regret to say, has been defeated. The cause *why*, and the means *how*, it has been done, we, for the present, shall not refer to. We may, however, be permitted to say that the opposition has not arisen from a spirit of liberal enterprise, or from enlarged views of the importance of securing to our State the immense transit duty upon the Western business. We shall, ere long, refer again to the subject, and in the mean time shall endeavor to obtain, for publication, a full report of the debate upon the subject.

DR. CHURCH.—The attention of many persons was attracted on Saturday to Dr. Church's beautiful steam-engine, which was running on the Covington road. The ground run over was six miles out and six home; and, notwithstanding the roads were in the heaviest possible state, in one of the trips four milestones (i. e. three miles) were passed in nine minutes; and two milestones were passed in the extraordinary short space of two minutes and a half.—[Birmingham Gazette.]

[From the London Mechanics' Magazine.]  
*The Undulating Railway—Mr. Badnall in Explanation.*

Dear Sir: Your readers might naturally expect that I should have taken a much earlier opportunity, either of publishing the particulars of those experiments to which I so urgently invited their attention some time ago, or that I should have given some satisfactory explanation of my motive for withholding them. I am not, however, without a hope that this letter will prove a sufficient vindication of my conduct against any charge of neglect or wilful delay.

In my letter of the 20th August last (1834,) I stated that the Whiston Branch Railway was completed, but that our experiments were unavoidably delayed by the refusal of the Directors of the Liverpool and Manchester Railway to accommodate us by the loan of a suitable locomotive engine. At the same time, I intimated that, under such circumstances, I had no other resource than to endeavor to obtain an engine elsewhere, either on loan or hire.

With this view I made every necessary inquiry; but the only engine which I could hear of as being disengaged was the Manchester, which was built by Messrs. Galloway, Bowman and Glasgow; and though capable of dragging a considerable load, she was, from her particular construction, by no means adapted to the safe attainment of that velocity which could alone determine, on the Whiston line, the comparative superiority of an undulating or horizontal railway. I say upon the Whiston line, because the dip of the undulation was greater than I should ever recommend in practice; which may be judged of from the fact, that a loaded waggon, descending from the colliery by gravity alone, attained, after traversing about 500 yards, a velocity of upwards of 30 miles per hour.

Perceiving, however, that I had little, if any other, chance of trying immediate experiments, I consulted my partner, Mr. R. Stephenson, sen., on the subject, who, from being well acquainted with the capabilities of the engine, strongly objected to her being employed for the purpose in question, it being his opinion that, although a very powerful engine, when in good repair, the Manchester could not be trusted at those velocities which, upon the Whiston undulation, it would be necessary to attain. Mr. George Stephenson was also of a similar opinion.

Thus situated, I resolved on making a second application to the Directors of the Liverpool and Manchester Railway, offering, at the same time, a guarantee for payment of any damage which the engine might sustain, and explaining the difficulty in which I was placed, by having publicly announced the trial of my experiments; which announcement I was induced to make in consequence of a verbal communication which I previously had with Mr. Booth, and from which I had formed, it appears, erroneously, on the opinion that, if a guarantee were given, there would be no longer an objection to the loan of an engine being granted me. To this second application I received the following reply:

"Railroad Office, Oct. 13, 1834.

"Dear Sir: I submitted to the Board your renewed application for the loan of a locomotive engine, for your proposed experiments on the Whiston Branch Railway, and am required to inform you that the Directors regret they cannot comply with your request. They gave the matter due consideration previous to their former de-

cision, and they do not see reason to alter the determination they then came to. I am, dear Sir, yours most obediently,

"H. T. BOOTH.

"Richard Badnall, Esq."

Under these circumstances, and finding how impossible it was for me to obtain a suitable engine, and feeling how deeply I had committed myself in your pages, by a declaration that the period was arrived when the whole question should be determined without further delay, I was resolved to adopt the only means which were left me of even partially fulfilling my pledge to the public. On the 21st October, I therefore called on Messrs. Galloway and Co., and solicited the loan of the Manchester engine for a few experiments, under the promise that the maximum velocity attained should not exceed from 20 to 25 miles per hour. With a liberality for which I feel greatly indebted, Messrs. G. and Co. granted my request, merely requiring a guarantee that I would return it in as good condition as I received it. On examining the state of the engine, it was found that the pistons required repacking; but as we could not expect to come to any very decided result, (the velocity being limited,) it was thought unnecessary to make any alteration for a first trial. On the 24th October, Mr. Robert Stephenson, sen., and Mr. Gill, accompanied me, therefore, to Whiston; and the Railway Directors having accommodated us with empty waggons, we proceeded, after loading them with coal, to the trial of such experiments as we deemed compatible with safety, and likely to produce some data, whereon an opinion, pro or con, could be formed.

It is necessary that I should here state, that the Whiston branch line was completed by Mr. McKenzie, under contract. That gentleman had previously given me a section, and although, upon that section, the summit levels were, no doubt, accurately defined, no intermediate levels had been denoted, either on the section or by stakes, on the ground itself; our only course, therefore, was to start from such parts of the descending line from the colliery, as would prevent our attaining a dangerous velocity, and to ascertain how far the train would rise on the opposite ascent; marking the starting and resting points, until future levels could be taken. Had the inclinations been regular, this precaution would have been unnecessary, as the measurement of the distances would, in such case, have determined the elevations. But the Whiston line forming one extensive undulation, varying according to the surface of the land, no criterion could be formed from such calculation.

An accident, which some time ago occurred to the Manchester engine, which left the rails, when descending the Sutton inclined plane, had unfortunately given her the character of an unsafe engine at high velocities; and it was evident that, on the present occasion, both the engineer and fireman were afraid of her. We, however, made eight experiments; Mr. Stephenson, myself, or Mr. Gill, accompanying the engine-man on each occasion. Our load was 80 tons; which, considering the condition of the engine, was an ample one, as she was proved to be only capable of drawing on that day about 15 tons up an inclination of 1 in 84, her steam being at from 40 to 50 lbs. on the inch pressure, though partially escaping between the piston and cylinder.

By these experiments, we were enabled to prove one very satisfactory circumstance—

which was, that, notwithstanding the many disadvantages under which we labored, the train invariably rose to a higher summit than that from which she had previously started. For instance, in the first experiment, the train started from a given point, which was carefully denoted, and rose to a higher point on the opposite ascent, which was also denoted; the total distance being 760 yards—time, 2' 35". The power then being reversed, the train rose 34 yards higher than it had originally started from; again being reversed, the train rose 64 yards higher than on the first experiment; total distance 862½ yards, time 2' 26". The power being again reversed, the train rose 38 yards higher than before—total distance 900 yards; when again reversed, the train rose 171 yards higher than before—total distance 1071 yards; and on the next occasion the total distance was 1167 yards.

On the 7th trial, no accurate result could be deduced, as some of the brakes were on the waggon wheels.

On the 8th experiment, the steam was brought down to 10 lbs. upon the inch; and I have every reason to believe, that when I am enabled to transmit to you a precise statement of the level from which it started and at which it rested, it will be found that the 80 tons were conveyed at that low pressure, very nearly, if not quite, from summit to summit.

Your readers will, I fear, be disappointed, and by no means satisfied with the rude statement which I now feel it imperative upon me to publish; but until I have a better opportunity of deciding the full merits of the question, I can only put them in possession of facts as they really occurred—this I have done myself. In justice to myself, however, and to the cause which I have conscientiously advocated, and still continue to advocate, I ask them, what could I have done more? or what, under existing circumstances, can I do? All men of science must, I am persuaded, sympathize in my regret, that experiments of such a nature should be delayed, when such delay could be so easily avoided; and with regard to any chance of a satisfactory conclusion being come to, by employing the Manchester engine, I need only refer to Messrs. Galloway & Co. themselves, who, I am sure, will bear testimony to her being in every point of view unsuitable to the purpose. She is, as before observed, an engine capable of drawing heavy loads at moderate velocities, but her many moving parts and general construction, render her altogether unfit for the trial in question. It was my wish to have sent with this letter a correct section of the Whiston branch, with the exact distances denoted thereon, which the train traversed at our recent experiments; but severe indisposition, which has, since the end of October, with the exception of a few days, confined me to the house, has prevented my paying that attention to the subject which I should otherwise have done. Wishing, however, to have an impartial survey of the line made, I wrote to Mr. Hall, of Warrington, begging him to prepare the necessary sections, showing the various levels, &c.; but he has not yet been able to undertake it, owing to his time being entirely occupied in completing a survey of the Grand Junction line, to deposit for Parliament: when the section alluded to is completed, I will forward you a copy of it. As a proof of the unfitness of the Manchester engine, for the trial of experiments on the Whiston line, I need only remark, that over a great portion of each undulation, her power was not only

ineffectual, but she was almost an incumbrance, owing to the loaded waggons attaining, by gravity, a greater velocity than she could effectually command in advance of them. This will easily be understood by those who consider the difference in the friction of a railway waggon, and a locomotive engine of her description. It also shows, that upon deep undulations, such as the Whitson line (where we have a fall of more than 30 feet in 500 yards), none but engines capable of sustaining an excess of speed above that which is produced by gravity, can be employed with full effect. Such was my view when, in allusion to the Whitson line (see page 214, No. 516), I said, "*the full effect of practical experiment must depend upon the momentum acquired by the combined forces of gravity and steam being safely and effectually maintained down the descending line of each undulation.*" For the same reason, also, I have before mentioned that, for general practical purposes, a dip of about 15 feet in a curve of 1,000 to 1,200 yards, would be the proportion I should most strongly recommend: though exceptions might, of course, be advantageously made, where the nature of the ground required it—especially in passing under or over cross-roads, canals, &c., or where the inclined planes would not be so deep or so extensive as to produce a dangerous velocity without the employment of the brakes—considering, as I do, that velocity on railways is always dangerous when the engine (her full power being employed) is not able to keep up a dragging influence on the succeeding carriages, or, if behind the train, a propelling influence on the carriages in advance.

So convinced did I feel that no further impediment would be thrown in the way of a full and impartial trial of the undulating railway theory at Whiston, that at the meeting of the British Association at Edinburgh, in September last, I as publicly announced my intention of immediately bringing the question to issue, as I had previously done in your pages. I hope, therefore, I shall not be accused of any disrespect to your readers, to yourself, or to the public at large, for a breach of engagement which it has been entirely out of my power, for the present, to obviate. I am, Sir,

Yours most respectfully,

RICH. BADNALL.

Farm-hill, near Douglas, Isle-of-Man,  
Dec. 31, 1834.

I take the earliest opportunity of laying before the readers of the Journal Mr. Mills' Report of his survey of the route for the Rochester and Olean Canal. A part only is given in this, and it will be continued in the next number.

*Report of Frederick C. Mills, Engineer, to the Honorable the Canal Commissioners of the State of New-York.*

GENTLEMEN—

In compliance with instructions received from your Board, also from Jonas Earll, Jr., acting Commissioner, and in accordance with the "Act, passed April 30th, 1834," I have made a survey and examination for a navigable canal "from Rochester up the Genesee valley to Olean on the Allegany," and also for "a side cut from the village of Dansville, down the Canascraga Creek, to the aforesaid canal, at or near Mount Morris," and very respectfully submit the result of my examinations in the following report, illustrated by the requisite maps, profiles, and plans.

In examining the country, embracing all the routes possessing claims to consideration (within the provisions of the act), I have been ably assisted by Henry Stanley Dexter and J. Clements Stocker, and feel bound to acknowledge my obligation, for the intelligent and assiduous performance of the several duties assigned them; I also received material aid from the result of former surveys, and from residents, who for some time have been alive and thoughtful on the subject.

Having learned that the principal difficulties on the route were south of Mount Morris, and that the most important were the slide banks on the Genesee River, above Portageville; the pass round the falls of the Genesee, in the town of Nunda; the summit and the amount of lockage thrown together at the village of Mount Morris; my attention was early directed to those points, and before making a permanent location of any portion of the main line, and with the hope that I might find a route which would avoid the greatest part of these difficulties, I made my examinations upon an extended and liberal scale, and after traversing much of the country on the range of high grounds, forming the dividing ridge between the waters that flow into the Ohio on the south, and Lake Ontario on the north, I was fully persuaded that the Oil and Black Creek summit presented the most favorable point of connection with the Genesee and Allegany. In the atlas accompanying this report, to which reference will be made, you will find, first, a general map of the country from Olean to Rochester, including the surveys of Lime, Beaver, Mud, and Fish Lakes, in the north part of Cattaraugus county.

Secondly, a map upon an enlarged scale, upon which I have delineated the profiles of all the different routes.

Thirdly, plans of locks, aqueducts, culverts, bridges, &c. In addition to which, I have executed in a condensed form and annexed to this report, a general map of the country in the vicinity of the canal route, on a scale of 2½ miles to the inch.

The line which I have selected as the basis of my estimates, has been located with unusual care. It commences near the boathouse on the level of the Allegany River, at Olean Point; thence (to avoid high lands) the line winds round the easterly side of the village of Hamilton, following up the Olean Creek valley, upon the west side, over very favorable grounds for the construction of a canal, to the junction of the Ischua feeder with the summit level, and is 9¼ miles in length from Olean Point.

Estimated cost, \$109,619.87.\*

Upon this portion of the route I have located 10 levels, varying from 4.55 chains to 3 miles 46 chains in length, 9 locks of 8 feet, and 1 of 7 feet, 1 culvert, 18 bridges, 3 waste-weirs, and 1 wooden aqueduct, 60 feet long, on stone piers, in crossing the Ischua, about 50 chains north of Hinsdale.

If necessary, a feeder from Olean Creek may be added at a very small expense, about one mile below Hinsdale. The Olean is a very sluggish stream, formed by the union of the Ischua with Oil Creek at Hinsdale, flows through fertile alluvial flats, about half a mile wide, and 200 feet below the tops of the hills on either side. From the summit level, there is a descent to the Allegany River at the confluence of Olean Creek, of 79 feet, and at the boathouse (37 chains below) of 80½ feet.

SUMMIT LEVEL.

This level commences on E. Wood's

land, and following up the Oil Creek valley, through parts of the towns of Hinsdale, Cuba, and Haight, terminates on the head waters of Black Creek, about 4 miles 51 chains from the village of Cuba. On this summit, between the Genesee and the Allegany, a little east of Cady & Baldwin's Mills, there is a swamp of about two miles in length, principally covered with timber, the waters of which drain both ways, forming tributaries to Oil and Black Creeks. (Deepest cut on the summit, 12 feet.) From Cady's Mill, the line was carried down on the north side of Oil Creek valley, to the first lock, descending south near Mr. Wood's, where, from a feeder of 2¼ miles in length, the whole of Ischua Creek can be received into the summit; 3 waste-weirs, 11 farm and 6 road bridges, will be required.

Cost of summit level, \$31,535.22.

The summit pond might be extended down either side of the creek with facility, obtaining generally a choice of cut without running much upon the face of the steep side hill; and on first travelling over the ground (having in view the accommodation of villages on the line), I thought most favorably of the south side; but on a more minute examination, found that the expense would be materially increased, owing to an additional aqueduct, and very high and long embankment necessary for conducting the Ischua feeder over Oil Creek valley, at which point the surface of the creek is 32.65 feet below bottom.

On Oil and Ischua Creeks, there are 5 saw mills, 2 carding machines, and 2 grist mills, which will lose all their water by the canal in the dry season. Six saw mills and one grist mill on Olean Creek will sustain a proportionable loss of water during the same season. It is supposed, however, that the damage (if any) will be small, inasmuch as the saw mills are seldom run, except in the spring and fall, when there is an abundance of water.

The summit will be eleven and a half miles in length, is 79 feet above the Allegany at Olean Point, 978 feet above the Erie Canal at Rochester, and 1,484 feet above low tides.

A passage here from the Ohio valley to the Genesee valley is less elevated than any other passage that has been examined, except the route up the Conewango valley, via Lake Erie, Buffalo, and the Erie Canal.

According to Mr. Whippo's survey, this summit is 724 feet above Lake Erie, and as L. Erie is 568 feet above the ocean, it results that the said summit stands 1,292 feet above tides; 192 feet lower than that of Oil and Black Creeks.

It is, however, observable, that in all the examinations that have been made from the Ohio valley, either to the Potomac or the Susquehannah valley, no passage has been found so low as the one I have adopted, by some hundred feet.

That of Blair's Gap summit on the Pennsylvania Canal route, is 2,291 feet, and that of the Chesapeake and Ohio Canal, 1,998 above the Atlantic. To pass the latter, a tunnel of 4 miles in length will be required. The former is effected by a railroad 36.69 miles in length (from Johnstown to Hollidaysburgh), overcoming an aggregate ascent and descent of 2,570 feet; 1,398 of which is on the eastern, and 1,179 on the western side of the mountain.

From the summit, the line takes a northeasterly direction down the valley of Black

\* Smith's mills will sustain serious injury, and an appraisal of damages will be necessary.

Creek. For about 5 miles (except some few points where the high bank approaches the creek abruptly, which points may be avoided by turning the channel of the creek at a very small expense,) a favorable route can be obtained over a regular surface, gradually descending at the rate of 12 feet to the mile to Bruce's mill, where a rapid fall takes place. In  $2\frac{1}{4}$  miles, which brings us to the point of leaving Black Creek valley, there are 11 locks of 8 feet each.

Lock No. 20, is at the head of this rapid descent, in a narrow defile caused by the sudden approach of high rocky banks on either side of the creek. In passing this point considerable rock excavation will occur, owing to the necessity of cutting the body of the canal into the steep side hill for about 20 chains, on the north side of the creek. The embankment must be protected by a stone wall. The rock is principally gray sandstone, and easily quarried. It is fine building stone, and will be useful in the construction of locks.

Upon this rapid, Willard Bruce, the proprietor, has erected a saw mill, fulling mill, and grist mill, with two run of stones, which, together with 100 acres of land, is valued at \$2,800.

He has 12 feet head and fall, and water sufficient in the driest season to turn one run of stones. The mills will be injured by the canal, and be a subject of claim for damages; but the land will be enhanced in value.

Between the mouths of Black and Crawford Creeks on the Genesee River, there are several slide banks of a serious character, which are entirely avoided in the present location. At the point of leaving Black Creek, about one mile above its junction with the river, is a favorable valley putting thro' the high grounds, which bound Black Creek valley on the north, through which we pass (2 miles), in a very direct line, coming out upon the Genesee River one fourth of a mile south of Ketchum's, near Crawford's Creek, by which we not only avoid the slides, but save nearly two miles in distance. Here, from a feeder of 20 chains in length, and a dam of small elevation, the whole of the Genesee River may be received into the canal.

The distance from the summit to this point is  $9\frac{1}{2}$  miles—the descent 242 feet. To overcome this fall, it will be necessary to construct 27 locks of 8 feet lift, 2 of 7 feet, and 2 of 6 feet.

There are 3 culverts, 5 waste-weirs, 6 road and 14 farm bridges, required on this portion of the route. Estimated cost, \$225,052.35.

Following down the river from this to Portageville, 20 miles, the valley is often wide, free from high, precipitous, rocky shores, and (with the exception of some obstructions by slip banks of clay) presents unusual facilities for the construction of a canal, and (as will be seen by reference to the estimates of each section in detail) bears a remarkable comparison with the same distance on the east side of the Genesee River from Mount Morris to Rochester, lockage excepted.

The principal, and indeed the only serious slide bank we have to encounter, is on section No. 33. It is a high steep bank, and embraces several acres of ground. At this point (as seen on the map) the Genesee runs nearly at right angles from the east to the west side of the valley, and after washing the base of the slip bank, continually increasing its depth (now 20 feet), as well as increasing the tendency of the bank to slide, it makes off again across the

valley, touching the eastern hill within 22 chains of the point of leaving it.

To secure against these slides is difficult; great disasters are often occasioned by them, and in order to get by this point with safety to the canal, I propose changing the bed of the river, and constructing the towing path on the opposite bank of the old channel.

Near the hill on the east side of the valley, is a natural ravine, through which, by the erection of a strong dam across the river, and cutting down a narrow ridge  $5\frac{1}{4}$  chains in length, the Genesee River may be turned at comparatively small expense, which is the most feasible plan of avoiding all danger from the slide.

The Genesee sends forward 5,007 cubic feet of water per minute at the point proposed to take it into the canal, as a feeder above Crawford Creek.

From Crawford Creek to Portage we cross Caneadea, Cold and West Koy Creeks, all fine permanent streams, discharging in the driest season 2,800 cubic feet of water per minute, which may be received into the canal with facility.

The least expensive mode of crossing these streams would be by the construction of dams with wooden towing paths; but as the crossing of ponds of this description is often attended with great inconvenience from the strong current in the time of freshets, I prefer, and have adopted, the more expensive plan of crossing in aqueducts, and introducing the several streams by short feeders, with appropriate bulkheads.

In case it should be deemed necessary hereafter, the Genesee River may be taken in at several points between Cold and West Koy Creeks.

On this 21 miles and 30 chains, there will be 3 aqueducts with wooden trunks, 1 with stone arches in cement, 14 culverts, 3 waste-weirs, and 20 road and 35 farm bridges.

#### PORTAGE HILLS.

At Portage the continued high grounds which come down from the east and west sides of the river, and enclose the valley and fertile flats above the falls, are separated only by a deep chasm through which the river passes, with high perpendicular banks on both sides, descending 274 feet by 3 successive falls in the distance of two miles.

The perpendicular banks generally are of aluminous shale or gray wacke, with occasional strata of sand rock of a texture sufficiently hard for building purposes, and at some few points between the second and third falls, the banks are 400 feet above the level of the river.

Judge Geddes, in his report of 1826, proposed passing this point by going round in the bed of the river. Mr. Jones' plan was to tunnel the hill at a favorable point. To pass this ridge, by either of those routes, appeared exceedingly difficult and expensive. Different plans were proposed, various routes suggested, and many examinations made on both sides of the river, with the view of finding some one more feasible, but without success.

Finding no alternative, but the adoption of one or other of those routes, and having some doubts which was the most favorable, I deemed it advisable to make a minute survey and estimate of both, which has resulted in favor of the river route, although it increases the distance above the one through the tunnel, nearly  $1\frac{1}{4}$  mile, the river at this place making a long circuit round the hill.

The estimated cost of the tunnel route

upon the first plan, (which I would recommend) is a fraction less than that of the river route; but the hazard of encountering unforeseen difficulties, in tunnelling through a hill where quicksand occurs, has induced me to give the preference to the latter route.

The canal crosses the river at Portage by an aqueduct 280 feet long, and to maintain the best elevation for passing the ridge on either route, it must be 36 feet above the bed of the stream. The trunk to be of wood on stone abutments, and piers 42 feet apart laid in hydraulic cement. The site for an aqueduct is a very favorable one. The bed of the river is a flat horizontal rock, with high banks, and stone in abundance may be quarried near the spot.

In the village of Portageville the line will run west of the main street, crossing it at a point where two buildings only obstruct the passage, if the line should be located on the river route; but should the tunnel route be adopted, it will be necessary to remove four buildings.

The lines diverge at Portageville, the one pursuing an easterly direction for 65 chains, over the upland slope near the foot of the hill, passes the ridge by a tunnel 26 chains in length; the other following round by the river, runs under a steep bank or precipitous hill, requiring a very high embankment, principally formed in the bed of the stream, and protected from the floods by a heavy stone wall, until it gains the table or upland slope at the end of section 52, immediately below the first falls.

About 50 chains further on, another spur of the hill comes out abruptly to the deep defile, in which runs the Genesee river, not less than 380 feet below the top of the bank.

After passing this ridge, which rises above the bottom of the canal 98 feet to its summit, and is 22 chains through, the hill suddenly recedes to the east, and leaving the river's bank, the line follows along the north slope of Portage ridge, over tables of very favorable elevation, to the north end of the tunnel, which is 2 miles and  $68\frac{1}{4}$  chains from Portageville.

In making the survey with a view to a line through the hill, it was ascertained that the summit of the ridge was 204 feet above bottom, and that the tunnel would not exceed 26 chains in length.

The soil or upper covering of the hill is of clay and gravelly loam, the hill steep at each end of the tunnel, with a valley below, offering great facilities for the deposit of surplus excavation. From the appearance of the rock upon the banks of the river, and in all the ledges of that vicinity, there were strong indications that the excavation for a large portion of the tunnel would be through rock lying in horizontal strata, easily broken up, yet sufficiently hard to support the archway without the aid of masonry, and had it not been proved by subsequent examination, that the contrary was the fact, the superiority of this route would have been unquestionable.

To determine this point, and to show the character of the excavation in the interior, shafts were sunk on the slopes of the hill near the ends of the tunnel, where quicksand made its appearance in such quantities, as rendered it quite impracticable to sink the shafts to the level of the canal. It was still the opinion of some that rock would be found after passing the slopes of the hill. To put an end to all doubts that might arise upon the subject, I directed another shaft to be settled near the centre of the ridge, which was carried down through sand and gravel to within 20 feet of the

bottom line of the canal, at which point we again encountered quicksands.

To construct a work of this magnitude through such materials, would undoubtedly prove very expensive, and any estimate that can now be made of its cost, must in some degree be founded on conjecture, and of course liable to vary from the truth. However, for the purpose of comparison, I have estimated for a tunnel wide enough to pass two boats, the arch-way to be constructed of permanent stone masonry, with a wooden horse path, and in the following statement present the approximate cost, from the aqueduct to the north end of the tunnel.

Cost from aqueduct to south end of tunnel, - - - \$4,474 45  
Total cost of tunnel, - - - 140,106 52

Aggregate, - - - \$144,580 97

To pass the point of rocks or deep cut of 98 feet by the river route on section 53, two plans were proposed, one a thorough cut, the other a short tunnel of 16 chains in length. The line here is far enough from the margin of the gulf to insure the safety of the canal, and yet so near that the surplus materials may be conveniently discharged into the bed of the river, which will tend very much to diminish the expense on either plan.

The estimate for the tunnel is \$14,240 less than cutting down the hill, and should this plan be adopted, (which I would recommend,) the whole cost for the river route will be \$163,232 49, being \$18,651 52 more than via the long tunnel.

In the detailed estimate marked H, for the eastern or long tunnel, will also be found an estimate for a tunnel of less width, calculated to pass only one boat at a time, the cost of which is \$56,228 57 less than the other; and should this mode of construction be deemed suitable for a work of such magnitude, this may possibly be the cheapest way of overcoming the obstacles at Portage.

From Portage tunnel to the Dansville side cut at Mount Morris, the descent is 549 feet.

[To be Continued.]

The annexed extract from Mr. Johnson's Report gives a comparative statement of the distance, lockage, and cost of transportation from the Ohio River to New-York, on three different routes.

#### Routes of communication to the Ohio Valley.

In order to exhibit the comparative advantages of the different routes proposed and in use from the Atlantic cities to the Ohio River, I subjoin the following account of the distances, lockage, cost, and time of transportation on them. It will be seen by a reference to these statements, that the expense of transportation upon the Allegany River and Pennsylvania Canals, will preclude the possibility of the trade of the Rochester and Olean Canal being drawn through that channel, or through any other injurious to the interests of this State.

1st. To New-York from Portsmouth, via the Ohio Canal, Lake Erie, and the Erie Canal.

	Miles.	Lockage in feet.
Ohio Canal,	308	1,207
Lake Erie,	190	
Erie Canal,	363	689
Hudson River,	145	
<b>Total</b>	<b>1,006</b>	<b>1,896</b>

2d. To Philadelphia from Pittsburgh, via Portage Railway and the Pennsylvania, Union, and Schuylkill Canals.

	Miles.	Lockage.
From Pittsburgh to Johnstown,	105	474
Portage Railroad,	36½	2,570
Pennsylvania Canal,	153	646
Union Canal,	80	508½
Schuylkill Canal,	60	182½
<b>Total</b>	<b>434½</b>	<b>4,345½</b>

Thence to New-York as follows:

	Miles.	Lockage.
Delaware River,	30	
Delaware and Raritan Canal,	43	112
Raritan River and Staten Island Sound,	40	
<b>Total</b>	<b>113</b>	<b>112</b>

Add from Pittsburgh to Philadelphia, as above, 434½ 4,345½

Total from Pittsburgh to New-York, 547½ 4,457½

To New-York from Olean, via Rochester and Olean Canal, Erie Canal, and Hudson River.

Rochester and Olean Canal,	105½	1,057
Erie Canal,	270	630
Albany to New-York,	145	

Total, 520½ 1,687

#### Chesapeake and Ohio Canal.

From Wheeling to Georgetown, 310 3,153

From Pittsburgh to Georgetown, 341½ 3,215

From Pittsburgh to New-York, via the Chesapeake and Ohio, the proposed Maryland, the Delaware and Chesapeake, and the Delaware and Raritan Canals, will be 615 miles. Lockage 3,661 feet, which, reduced to a level, will be=146.44×615=761.44 miles total distance.

From the above statement it appears that the length of the route now in use from the City of New-York to the Ohio River, through this State, is 1,006 miles, with a lockage of 1,896 feet; which, considering 25 feet of lockage equal to a mile in distance (including unavoidable detentions at the locks), is equivalent to a distance of 1,081.85 miles, of which 335 are steamboat navigation. By the route which is the subject of the present report, the distance from Olean to the City of New-York will be 520½ miles, and a lockage of 1,687 feet, making in all 587½ miles, of which 145 miles is steamboat navigation. From Olean to Pittsburgh by the river, is 290 miles, and there is an average fall of 2½ feet per mile. The transportation from Pittsburgh to Philadelphia is effected by canal, with the exception of 36½ miles of railroad over the Alleghany Mountains. The distance is 434½ miles, in which a rise and fall of 4,345½ feet is overcome by means of locks and inclined planes, with stationary power, equal in all from Philadelphia to Pittsburgh to 608.58 miles, and from New-York to Pittsburgh to 726 miles, including lockage.

Summary of the length of the preceding routes:

	Miles.
From Portsmouth, on the Ohio River, to New-York, via Erie and Ohio Canals, (including lockage,) 1,081.85	
From Pittsburgh to New-York, via	

Rochester and Olean Canal and Erie Canal,	867.60
From Pittsburgh to New-York, via Pennsylvania and Delaware and Raritan Canals,	726.00
From Pittsburgh to New-York, via Chesapeake and Ohio, Maryland, Delaware, and Raritan Canals, &c.,	761.44

The following calculations of the cost of transportation upon different canals are founded upon information received from gentlemen engaged in the forwarding business, and upon the Erie and Ohio Canals, conform to the tariff agreed to at the meeting of the forwarding merchants at Buffalo, on the 9th inst.

The cost of transportation from New-York to Portsmouth, on the Ohio, by the Erie and Ohio Canals, is as follows, viz.:  
Heavy merchandize, per 100 lbs., \$1 86  
Light " " 2 00

Returning.

Flour, per barrel, 1 80  
Whiskey, pork, butter, beef, lard, &c., per 100 lbs., 0 90

The average time required to make a trip to New-York, is from 18 to 24 days.

The cost of transportation from the City of Philadelphia, by the Pennsylvania improvements, is as follows:

Heavy merchandize, per 100 lbs., \$1 25  
Light " " 1 50

Returning.

On produce, (to Philadelphia,) 0 70  
Price of transportation from Philadelphia to New-York:

On light goods or merchandize, via canal, 0 25  
On heavy " " 0 12

Returning.

On produce, 0 10  
Making the total cost of transportation from the City of New-York to Pittsburgh, as follows, viz.:

Heavy merchandize, per 100 lbs., \$1 37  
Light " " 1 75

[Returning.

Produce, 0 80  
The average time required to make a trip to Philadelphia, is 15 days, and it requires about the same time to return: but to get goods from New-York by this channel, I am informed by Judge Griswold E. Warner, (a gentleman residing in Pittsburgh, requires from 20 to 25 days, some delay being unavoidable in making an extra transshipment upon the Schuylkill River into the canal boats.

The probable expense of transportation from New-York to Olean, via the Rochester and Olean Canal, would be as follows:  
On heavy goods, per 100 lbs., \$0 96  
On light " " 1 07

Returning.

On produce, per 100 lbs., 0 55

#### PRICES OF RAILROAD STOCKS, At the New-York Stock and Exchange Board, MARCH 27, 1835.

[From the London Mechanics' Magazine.]

**THE EARL OF DUNDONALD'S REVOLVING STEAM ENGINE.**—The engravings on the preceding page exhibit the construction of a rotary engine, which has been recently patented by the Earl of Dundonald, and the manner of its application to the propulsion of vessels. The Earl himself describes it in a circular, with a copy of which we have been favored, as surpassing in efficiency every thing of the kind hitherto produced—as being, in fact, so perfect, that perfection can no farther go. “The cause,” says his lordship, “of the uniform failure in the construction of rotary engines, has been the great difficulty of obtaining, within the machine, a base of resistance on which the steam might act in propelling the moveable piston. The means by which this has been hitherto attempted, have consisted of a variety of very imperfect mechanical contrivances, all of which have proved quite inadequate to the successful employment of this sort of engine; but in the REVOLVING ENGINE now offered to notice, this great difficulty is *completely overcome*. This engine is constructed on a principle that gives the *most perfect fulcrum* or resisting base, in a manner that leaves nothing on this head to be desired—indeed, it is as perfect, and nearly as simple, as the fixed cover or bottom of the cylinder of the ordinary reciprocating engine. The great and paramount difficulty of obtaining a suitable fulcrum being thus *completely overcome*, all other obstacles to the employing of this sort of engine at once disappear; in truth, from the result of numerous trials, during two years’ experience, it may be affirmed that this engine is constructed in such a manner as to render it *equally perfect and efficient as the best reciprocating engine*!” Nor does the perfection of this engine rest on the noble lord’s own testimony; for that very ingenious engineer, Mr. Alex. Gordon, in his “Treatise on Elemental Locomotion,” 2d edition, 1834, speaks of it in the following *equally encomiastic terms*: “Of the many rotary engines none have stood the test of long trial; and, indeed, as yet there is none in *practical use*, if we except that of the Earl of Dundonald, (the gallant and ingenious Lord Cochrane,) which bids fair to rival the best reciprocating engine.” \* \* \* The cause of uniform failure of other ingenious persons, in the construction of rotary engines, has been the difficulty of obtaining, within the machine, a base of resistance on which the steam might act in propelling the moveable piston. The means by which this has hitherto been attempted, have consisted of a variety of very imperfect mechanical contrivances, all of which have proved quite inadequate to the successful employment of this sort of engine; but in the REVOLVING ENGINE now under notice, this difficulty is *completely overcome*. This engine is constructed on a principle, that gives a *perfect fulcrum*, or resisting base; indeed, it is as perfect, and nearly as simple, as the fixed covers or heads of the cylinder in ordinary reciprocating engines, &c. &c.

3.

4.

The great and paramount difficulty of obtaining a suitable fulcrum having been *thus completely overcome*, all other obstacles to the employing of this sort of engine at once disappear: in truth, from the result of numerous trials, during two years’ experience, this engine is constructed in such a manner as to render it *equally perfect and efficient as a reciprocating engine*.” ‘Equally encomiastic terms!’ we think we hear the reader exclaim—‘Why they are literally the same terms—his lordship’s own words over again.’ So, gentle reader, in truth they are. What Lord Dundonald says, and all he says of his engine, Mr. Alex. Gordon says, and little more; not a tittle of difference is there, in three of the four sentences we have quoted from Mr. Gordon’s book, save just as much as might serve to make it appear, [no quotation marks being used,] that Mr. Gordon’s words are his own words, and not merely a parrot-like repetition of those of his lordship. But though the identity of the language employed in the two quotations be certainly very singular, it is, after all, but an identity in language, not necessarily extending to the matter of the extracts themselves. Mr. Gordon may have felt unable to say what he honestly thought of the engine in question, in better terms than those previously used by the noble inventor himself; and if so, can he be to

blame that he made use of the same terms over again? Obviously not. His lordship’s patent covers only the engine itself—not the words employed by his lordship to describe its perfections. There could be no piracy in the case—only a *little convenient appropriation*. But, it may be said, if Mr. Gordon was driven by such a sense of fitness to employ the same words as his lordship’s, he might at least have had the candor to acknowledge that they were the same, in order that his readers might be enabled to judge for themselves whether they are actually so fit—so peculiarly appropriate—that no person desiring to give a *discriminating, independent, and impartial* opinion of the invention, could employ any better; or whether the identity is but such as might be expected, where a person has lent himself to puff the pretensions of another, without any care for truth, honor, or reputation. We confess there is something in this; and, therefore, it is that we have done our best to make up for Mr. Gordon’s not very candid omission. No one—of our readers at least—will now be at any loss to determine for himself the degree of weight which belongs to Mr. Gordon’s opinion in the present instance. Mr. Gordon, it will be observed, goes on one material point considerably further than the Earl himself. The Earl speaks only of “numerous trials” of his

engine; Mr. Gordon talks of its being "in practical use;" and the words are put in the original, as here, in italics, to impress them more forcibly on the minds of the reader. The obvious intention of the phrase used by Mr. Gordon is to make the public believe that Lord Dundonald's engine has not only had many "trials" by his lordship himself, but has been thought so well of by others—by practical persons, requiring the use of a steam-engine for practical purposes,—that they have had engines made on this plan, in preference to reciprocating engines, and are now actually using them with great advantage. But what truth is there in this? What "practical use" can Mr. Gordon specify? Can he name a single vessel—not a "trial" one merely—where a marine engine, on his lordship's plan, is employed? Or refer us to a single mill or manufactory, where a revolving-engine of Lord Dundonald's is employed as the moving power? We are greatly misinformed, if it is in his power to do any thing of the kind.

It is not, certainly, as an engine in "practical use," nor even as one very likely to be so, that we now bring it under the notice of our readers. We think by no means so highly of it as either his lordship or his echo, Mr. Gordon. We give a place to the present description of it in our pages, for two reasons, very distinct from admiration: first, because of the considerable talk there is about it, owing partly to the celebrity, (for other things than machine inventing,) of the noble inventor, and partly to his prodigiously confident representations of its amazing capabilities; second, because if we are wrong in the opinion we have formed of it, (which not being persons of such infallible stuff as his lordship, nor of such ready faith as Mr. Gordon, we admit to be a possible case)—if it has really left "nothing to be desired," in the way of producing an effective rotary engine—it were a thousand pities that the knowledge of an invention, calculated to confer so much benefit on the mechanical world, and to save so much trouble and mortification to hundreds of ingenious mechanics, who are now occupied with the solution of that problem, of which it is said to furnish the best possible practical solution, should not be as speedily and as widely diffused as possible.

Fig. 1 is a representation, copied from Lord Dundonald's circular, of two engines of this description applied to the propulsion of a vessel. A A are the engines; B the air-pump; C C the deck; D a strong beam on which the engines and air-pump rest; E the space for the boiler. Figs. 2, 3, and 4, are sectional views of one of the engines, exhibiting, under different aspects, the peculiar mode of construction by which Lord D. flatters himself he has "completely overcome" the "great difficulty" in the case. We copy these views from Mr. Gordon's book; and shall copy also from it the following explanatory details:

"Fig. 2 is a longitudinal section, with the blade or piston A in one part of its

course (a lunette space). Fig. 3 is a cross section, showing the blade or piston A. Fig. 4 shows the piston in a different part of the lunette space; F is a fixed centre or axle, upon which the piston A turns—the radius sweeps round the inside of the larger circle D D; G is the mathematical centre (for there is no axis through the centre of the inner cylinder C C C, &c.) around which the cylinder C C turns. The piston A works in a ball-cock or stuffing at B; and in traversing the lunette space formed between D D and C C C, is obliged to slide out and in through B. At one time this piston A will have a larger portion protruding from C C C, as in fig. 3; and at another time it will protrude less, as in fig. 5. At one time, in each revolution, A will be at a point where there is no part protruding. The piston *crawls* out of and into the cylinder C C C (through B) constantly. The steam from the boiler is admitted through the hole S, and rushes along the opening Y, in the direction of the small arrow: it cannot escape where the cylinders C and D are in contact, and therefore it forces round the piston A in a contrary direction. The other part of the lunette space *evacuates itself* in the direction of the double arrows. Of course the power of the engine is always varying, because the surface of the piston is always either increasing or diminishing. To compensate for this variation, two cylinders are used; the one to be in full activity, while the other is passing the dead point. As the one decreases the other increases; and thus a continuous and rotatory motion is maintained, which can be applied in every case where the reciprocating engine is used for rotatory purposes."

We cannot say that this description of Mr. Gordon's is very clear or intelligible; it is, in truth, extremely loose and confused—in some parts, indeed, nonsensical. However, such as it is, we must leave our readers to digest it as they best can. It has all the appearance of being done to order, like the encomiums we before quoted from the same pen; and it would be presumptuous in us to attempt to offer any thing in the way of explanation or emendation. The engravings, at least, are plain enough; and, with their help, the intelligent reader will, we dare say, be able to arrive at a tolerably clear notion of all that is meant by *mathematical centres, crawling pistons, spaces evacuating themselves, &c. &c.*

Mr. Gordon adds, that "by some recent alterations in the steam-ways, the patentee has been enabled to use two pistons in one cylinder, and thus to save weight to a still greater extent. By this new arrangement, one piston increases in power in proportion as the other diminishes in power."

Supposing the engine to be as efficient as it is represented to be, the following are, according to Lord Dundonald, the principal advantages to be expected from its adoption:

"1st. It will not occupy one-sixth part

of the space required for the reciprocating engine.

"2d. It may be placed so low in a vessel as to be quite out of the reach of gunshot; or the cylinder may be made shot proof, without the slightest disadvantage.

"3d. The revolving engine does not require any valve or slide, consequently there is no waste of steam thereby; neither is there any loss, as in the space left at the top and bottom of the cylinders or reciprocating engines.

"4th. There is much less friction than arises from the sum of all the bearings required to convert the rectilineal force of the common engine to circular motion.

"5th. There are no beams, cranks, side rods, connecting rods, parallel motions, levers, slide valves, eccentrics, &c., with their nicely adjusted joints and bearings; therefore the revolving engine is not liable, even in one-tenth degree, to the accidents and hindrances of other engines.

"6th. The working of the revolving engine, in a steam-vessel, is much more pleasant to passengers, by the absence of tremor, now occasioned by the alternating of a ponderous mass of moving matter, twice in every stroke of the engine.

"7th. The revolving engine being contained within a cylinder, may be completely finished and united in the manufactory; and may be lowered into a vessel, and fixed in fewer days than weeks are now required to erect and adjust a reciprocating engine.

"8th. As the moving parts of the revolving engine pursue their course in perfect circles (without stop or hindrance) this engine is capable of progressive acceleration, until the work performed equals the pressure of steam on the vacuum, or on the atmosphere: an advantage which the reciprocating engine does not possess.

"9th. The revolving engine is completely under the control of the command<sup>r</sup> of a vessel, without the intervention of an engineer; simply by connecting a rod or line, from his usual station on deck, to a cock, by which he can set the engine going, stop, or reverse its motion.

"10th. The diminished bulk, weight, and absence of tremor, add to the capacity, buoyancy, velocity, and durability of vessels in which the revolving engine is placed.

"11th. This engine can, with equal aptitude, be constructed to propel the largest vessel, or the smallest boat; to pump the ship, weigh the anchor, embark or discharge the cargo, and perform the most laborious duties of a crew.

"12th. It is peculiarly adapted to locomotion on land; there being, in the revolving engine, no part requiring to be oiled,\* exposed to the adhesion of dust or grit, now so destructive to the rods, joints, and bearings of locomotive engines.

\* "The offensive smell, so much complained of in steam-vessels, arising from the decomposition of grease and animal oils, spilt in lubricating the bearings of the numerous parts in motion, may be greatly diminished, and, with care, may be wholly avoided where the revolving engine is used."

"13th. The revolving engine, from the solidity of its parts, the simplicity of its construction, and the uniformity of its impulsive action, can be kept in repair at less expense than the reciprocating engine; and, if used for mines or manufactories, an engine-house is not required; a simple shed or covering being sufficient.

"Lastly. One quarter of the capacity of ordinary steam-vessels (or half the engine room) is restored to useful purposes; whilst the vessel can be navigated by the same number of engineers and seamen, and with the same consumption of fuel. Thus the comparative cost of building the useful portion of a steam-vessel, and the expenses of all kinds, are diminished one-third; whilst the profit from an increased amount of cargo or passengers, or the facility of proceeding to more distant parts, is in the like ratio augmented."

[From the New-York American.]

#### Rejection of the Bill for Aiding in the Construction of the New York and Erie Railroad.

Since our notice of this subject on Monday, in which we gave an analysis of the final vote, we have been furnished with a statement of the vote in Committee of the whole, on the amendment proposed by Mr. Sibley. It was by this vote that the strength of the parties was shown and the fate of the bill decided. It was the object of this amendment, to remove all doubt as to the sufficiency of the security to be given by the Railroad company, before the issue of the stock which was to be loaned by the State. It provided, that when the Company had constructed and finished a single track of their Railway from the Delaware and Hudson Canal, to a point as far west as Binghamton, \$500,000 of stock should be issued; when they had finished a single track from the point above mentioned, to a point as far west as Elmira, a further issue of like amount should be made; when they had extended the track as far west as Olean, a third half million, and when the remaining portion, extending to Lake Erie was completed, a like amount should be issued.

We are informed that it was understood by the members generally, that this amendment would be proposed, and many of the friends of the measure considered the adoption of these provisions essential to the success of the Bill. The amendment was rejected by a majority of 2 only, as will appear by the following statement:

For the amendment.	Against it.
Allegany, 1	Albany, 3
Broome, 1	Cayuga, 3
Cattaraugus, 1	Clinton, 1
Cayuga, 1	
Chataugue, 2	Columbia, 3
Chenango, 2	Genesee, 1
Cortland, 2	Green, 1
Delaware, 2	Herkimer, 1
Dutchess, 2	Lewis, 1
Franklin, 1	Madison, 2
Genesee, 2	Montgomery, 3
Green, 1	New York, 4
Jefferson, 3	Oneida, 5
Livingston, 2	Onondaga, 4
Madison, 1	Oswego, 1
Monroe, 3	Utica, 2
New York, 4	Queens, 1
Niagara, 1	Rensselaer, 2
Ontario, 3	Saratoga, 2
Orange, 2	Schenectady, 1
Orleans, 1	Schoharie, 2
Oswego, 2	Seneca, 1

Rockland, 1	St. Lawrence 2
Seneca, 1	Suffolk, 2
Steuben, 2	Washington, 2
Sullivan, 1	Wayne, 2
Tioga, 2	West Chester 3
Tompkins, 3	
Warren, 1	55
Washington, 1	
Yates, 1	

53

Immediately after this vote, three of those who voted for the amendment left the House, and four others, on subsequent motions joined the majority, which reduced the minority to 46.

Of the members who had gone to their homes, it is believed that one from Chenango, 1 from Erie, two from Dutchess, and two from Ulster, would have voted for the amendment, and for the bill, had they been present; and likewise several of those who were out of the house, probably on the supposition that no question would be taken at that sitting.

It will be observed that of the members who voted against the bill, thirty were from fourteen counties on and adjacent to the Erie Canal route; seven from four counties north of that route; thirteen from five counties east of Hudson River, (including Queens and Suffolk,) and five only from counties south of Albany, on the west side of the River.

Of the members who voted for the amendment, 41 were from twenty-five counties west of Hudson River, and south of, or intersected by, the Erie Canal; six from four counties north of the Canal; and six from two counties east of the River.

Supposing the four votes of members from this city against the amendment to have been so cast on account of their "pledge," it will appear that 25 counties supported the measure, 19 opposed it, and the votes of six were divided. If the four votes from this city were owing to the pledge, and not to any opposition to the bill, then a just estimate of the strength of the opposition requires that they should be deducted from the 55 votes above stated, which would reduce the number to 51, and leave a majority of two in favor of the measure. Add to this, six votes of absent members, above referred to, and the majority in favor of the claim of the Southern counties would be eight.

We ask attention to these facts, in order that our readers may be enabled to follow us, in the remarks which we propose from time to time to offer, in explanation of the great interests thus contemptuously disregarded by the Assembly—and of the motives for their course—which we mean thoroughly to probe, and hope to be enabled to lay bare—names, and manœuvres, equally.

#### AGRICULTURE, &c.

**MEANS OF INCREASING THE PRODUCTIVE POWERS OF SOILS.**—The means at our command of increasing the productive powers of soils may be comprehended under the general following heads:

1. Supplying to the soil those organic and earthy substances which may be required.
  2. Altering its texture, depth and properties, by tillage and other means.
  3. Changing its relation with respect to moisture.
  4. Changing its relation with respect to temperature.
- Vegetable and animal matters, in a decomposing state, appear to act in various ways, in increasing the productive powers of the soil. They improve its texture, and they may be supposed to increase its power to absorb and retain moisture; but above all, they supply that matter, which, in whatever form conveyed to the organs of plants, tends to nourish them. This matter being absorbed by the roots of plants, it must be supplied when exhausted,

Experience has in every age accordingly taught the husbandman to supply those substances to the soil; and the doing so forms one of the most important means at his command of maintaining or increasing its fertility.

Besides the animal and vegetable matter which is mixed or combined with the mineral part of the soil, and is essential to its productiveness, the mineral parts themselves, it has been seen, require to be mixed together in certain proportions, and in certain states of division, in order to produce the greatest degree of fertility.

Silica and alumina form the principal mineral part of the soil. If one or the other of these earths be in excess, the soil is defective in its composition. If the alumina prevails the soil is too adhesive; if the silica prevail, it is too loose. A medium is seen to be the best; and although the precise proportion in which the alumina and silica should exist have not been determined, it is safer that there be a tendency to an excess of alumina than silica.

Further, the fertility of the soil depends on the state of division, chemical or mechanical, of these minerals.

It would appear, then, to be a means of improving the composition of a soil, to add to its silicious matter when it is found to be too stiff, and aluminous matter when it is found to be too loose; and, further, to reduce the substances to their greatest degree of mechanical or chemical division.

Sometimes, accordingly, we have the means of improving the constitution of soils, by mixing sand with clay, or clay with sand. But, in practice, the direct mixture of these two substances, for the purpose of producing a soil of better texture, is rare; First, because the expense of this species of improvement is considerable; and, secondly, because in the state in which sand and clay are usually available for this purpose, it seldom happens that the aluminous matter of the one, or the silicious matter of the other, is in that state of minute division which is favorable to fertility.

It is otherwise with earth lime. This can, in all cases, be reduced by heat to that state of minute division which is favorable to the productiveness of soils; and hence can always be applied with benefit to those soils in which it is wanting.

Lime is sometimes mixed, in its natural state, with aluminous and silicious matter. It then forms a marl, a substance which is frequently applied to soils as a means of improving them; it is chiefly to the lighter soils that lime is applied; for then, is not only lime applied, but alumina, to improve the texture of the soil. It is by means of this mixture that some of the greatest improvements on silicious sands, that have taken place in Europe, have been effected.

There are cases in which even calcareous matter is in excess in soils. This occurs especially in districts where the chalk formation exists. When the earthy stratum resting upon chalk is very thin, the chalky matter becomes mixed with it, and being then in excess, forms a barren soil.

An obvious means of amending the composition of a soil of this kind, is by adding any of the other earths, whether silicious or aluminous. We need not here scruple to apply them, because the clay is coarse or the sand silicious. We may add them in almost any form in which they can be conveniently procured; for the effect will be to improve the composition of the soil.

There is another case in which, in like manner, silicious and aluminous matter may be applied directly in almost any state in which it may be found. This is in the

case of peat. Here the vegetable matter is in excess, and the addition accordingly of any other earths is an amendment of the composition of the soil.

We see then, that the composition of soils may be improved by the addition of animal and vegetable matter, and also in many cases, by the addition of the earths in which they may be deficient, and in an especial degree of lime, which we can always apply in the form of minute division best suited to improve the composition of the soil. This is the first of the means referred to of adding to the productive power of soils, and will be considered in detail under the head manures, and other divisions of the management of the farm.

The second mean referred to of increasing the productive power of a soil, is altering their texture, depth and properties, by tillage and other means.

The mere effect of that communion of the parts of soil which it undergoes in the common operations of tillage, is seen to have a beneficial influence on the productive powers of the soil. Whether the soil imbibes from the atmosphere any thing but aqueous vapor or not, it is known that the exposure of the matter of the soil to the atmosphere, and the communing of its parts by tillage, add permanently to its fertility. Thus we learn from experience the good effects of tilling lands well; soils once tilled are rendered for the most part more productive by the process. Peaty turf, if suffered to remain in its original state, may continue to produce nothing but heath and the most useless plants; but, if merely ploughed, and exposed to the influence of the atmosphere, it will at once tend to produce grasses of a better kind, and of greater variety; and again, if a subsoil of coarse clay be exposed to the atmosphere, for the first time, it is generally at the first very unproductive, and it is not until after long exposure to the air that it becomes productive. This is most remarkable in the case of clay marl, a substance in itself containing the materials of a fertile soil, but which is often barren, until after pulverization and the influence of the atmosphere.

It is, indeed, conformable to analogy, as well as to experience, that soils should be improved by pulverization and exposure to the atmosphere. In our examination of the constituent parts of soils, we have seen that their fertility is in a great degree indicated by the proportion of minutely divided earthy matter which they contain.

The effect of tillage, therefore, may be reasonably supposed to promote this division, both by the mechanical action of our instruments, and by exposing the particles of the earth to the action of the air.

Another object sometimes produced by tillage, and subservient to the amendment of the soil, is the deepening of the upper stratum.

The subsoil, it has been seen, is distinguished from the soil so called, by its containing less vegetable and animal matter, and so being less suited to the nourishment of plants; and in many cases it is even found to be injurious to vegetation. It is generally important, however, that there be a good depth of soil, and thus it is often expedient, as a means of effecting a permanent improvement of the surface, to plough up and mix with it a portion of subsoil, even though that subsoil should in itself be infertile.

These, then, are the principal mechanical means by which we can improve the soil, and they will be considered in detail, under the various heads which relate to the operations of tillage,

Another mean, indeed, of changing the composition of soils, is incineration, commonly called *paring and burning*. This process will be described as connected with the operations of tillage, and may be considered as one of the mechanical means possessed by us of adding to the productiveness of the soil.

The third mean referred to, of adding to the productive power of soils, is changing their relation with respect to moisture.

In warmer countries the soil is comparatively little injured by an excess of water, and more frequently suffers from the insufficiency of it. In climates like that of Britain, however, the operation of conveying away the water which is in excess is an essential one, and, if neglected, the best devised scheme of improvement may fail. The surplus water is either stagnant upon the surface, or penetrates below the surface. The freeing of cultivated land of water upon the surface, gives rise for the formation of land into ridges, by which the water escapes without stagnating upon the ground, or sinking into the subsoil below. This is an object necessarily connected with tillage, and will be described when the manner of cultivating land is treated of.

The freeing of the soil again from that superfluous water which is contained below the surface, forms a peculiar branch of agricultural improvement, and will be described under the head Draining.

As draining is more required in colder countries, so irrigation, or the watering of land, is less required than in those countries where the heat and evaporation are greater. Irrigation, however, is a curious and interesting branch of rural economy, derived by us from very ancient times. In this country it is chiefly employed in watering the lands in grass during the months of winter and spring.

The last of the means referred to of adding to the productive power of soils, is by changing the relation with respect to temperature.

This mean of adding to the productive power of soils, is less within our control than any of the others. It is only by slow degrees that we can improve the climate of a country. It is chiefly by draining, and the raising of hedges and wood: all of these, accordingly, form important objects of rural economy, and will be partially treated of in this work.

The means, then, of adding to the productive powers of the soil,—namely, supplying the organic and earthy substances which may be required—altering its texture, depth, and properties, by mechanical means—and changing its relation with respect to moisture,—will all be treated of under the different divisions of our subject; and we shall begin with that which is most closely connected with the nature and property of soils, the nature and property of those substances which we apply to the soil under the name of manures.—[Cultivator.]

**ITALIAN RYE GRASS.**—The following communication relates to a grass of great promise, if it will withstand our winters. The French and Scotch commend it as highly as the Germans, though it is of but recent introduction among them; and our personal observation tallies with the high character which all give it. We sowed some in Sept. 1833. It promised remarkably well—but the winter killed it. We supplied some friends with seed, which was sown last season; it is of course not yet known what effect the winter has had upon it. The State Society have directed a quantity of seed to be provided for distribution, with

the view of giving it a fair trial among us.

**Description and Culture of the Italian Lolch.**—(Translated from the German.)—The Italian Lolch, (*Lolium perenne italium aristatum*), yields the most abundant fodder of any kind of grass that is known. Its extraordinary yield has, for several years past, extended the culture of it, in one part of Germany and Switzerland, very rapidly, and also in France some agriculturists have made experiments with it which were completely successful.

If sown in October,\* its growth being very rapid, before winter sets in, it makes a thick sward equal to that on old grass land, and the first crop of hay is double to that of a common meadow. The Italian Lolch is entirely different from the English ray grass, which latter serves only as a means of making a sward on the land for pasture, does not grow over 2½ feet in height, and gives but two ordinary crops in one season, while the former commonly grows to a height of 4 feet, on a soil more moist than dry, and gives always four abundant crops in one season, and frequently more.

The haulm is covered with leaves of a light green color. The most proper time to sow it, is in the fall. After a crop of grain is taken off from the land, turn the stubble over, harrow it and sow the seed. And frequently it grows large enough to cut before cold weather; but it is advisable not to cut it, because it will take better root if left. Such a meadow shows itself before winter thick and well overgrown, like an old one, and the first year's crop was, by haying time, a full one. Sowing it in the spring, or month of April, requires moist weather and more seed. The plant is lasting. And at the end of the seventh or eighth year, these meadows are as vigorous as they were in the first year. If, however, light places are to be seen, they may be renovated by letting the seed get ripe, and shell out, on such places, or they may be sown with new seed. A soil more moist than dry is generally best adapted for this plant, but it has been tried on high lands and on the Alps, where it likewise perfectly thrives.

After grain or potatoes, (or other hoed crop,) a shallow tillage is sufficient. After clover or lucerne a deeper tillage is necessary, but on old meadow it is advantageous to cultivate first a crop of potatoes or grain, and after these being harvested in the fall, sow the Lolch. These meadows are treated like other meadows; every three years they receive a manuring—top dressing—and the first one is incorporated with the soil at the time of sowing the seed. The ground ought to be well harrowed. The seed is sown broad-cast—about 40 lbs. to the acre. If sown in the spring, 8 to 10 lbs. more are necessary, and one chooses as much as possible a wet time to sow it. After the seed is sown, harrowing may be dispensed with, but the ground ought to be rolled with a heavy roller. This operation has the double advantage to press the seed into the ground, and smooth the land for mowing.

H. D. GROVE.  
Hoosick, Rens. co., N. Y., Jan. 31, 1835.

\* Note by the translator.—The winter in those parts of Germany where the lolch is cultivated, does not set in so early as in this section of the country.

“They won't stay put.”—The subjoined articles of intelligence may be relied on as accurate. Divorced by the Supreme Court on Friday, 20th Feb. 1835, for intolerable severity, Mrs. Nancy Tyler from Mr. Samuel Tyler. Married, on Monday, 23d Feb. 1735, Mr. Samuel Tyler to Mrs. Nancy Tyler.—[Green Mountain Democrat.]

**CULTURE OF THE MULBERRY.**—It seems to be a matter well established, that at least the white mulberry will do well in our state. We wish we could affirm as much of the *morus multicaulis*, but our experience compels us to say, that its success in the northern section of the State is at least doubtful. The next question to be solved is, can the silk business be rendered profitable? That it can, in families who have females and children, who will gather the leaves and take care of the worms, we have no manner of doubt. The last Farmer's Register contains an interesting letter upon the subject of silk culture, translated from the French, which the restricted limits of a monthly sheet prevents our publishing in detail, as it does many other articles of interest. It is written by M. Carrier, of Aveyron, into which department the silk business has been recently introduced, to M. Bonafous, director of the royal garden at Turin, giving an account, among other things, of the product and profits of his silk business in 1833. This is stated in the following extract:

"I will now show you," says the writer, "the account of the sale of my silk of 1833. I shall take care to subtract the expenses, and you may see the clear profit.

29 1-5 kilograms white silk, at  
63 francs the kilogram, . . . 1,830f. 60c.  
2 11-12 inferior silk, at 18 fr.  
the kilogram . . . . . 53 95

1,834f. 55c.

Deduct for portage 16 00

1,868f. 55c.

Value of the different remains,  
coming from the remains of  
the filatures used at my house, 115 00

Sum realized . . . 1,983f. 55c.

For the expense of manage-  
ment, . . . 171f. 75c.

For filature, reeling, 263 85

435 60

Profit . . . 1,548f. 95c.

"To appreciate the advantages of the cultivation of the mulberry, one must remember that this sum, 1,548 francs of profit, (after deducting all the expenses,) is the product of leaves furnished by trees which have occupied for eight years, on an average, a piece of ground rather less than half a hectare, or at most two seterees, a local measure."

The kilogram is two pounds two ounces and four grains, avoirdupois; the franc is 18  $\frac{2}{3}$  cents; the c. (centime) one hundredth part of a franc; the half hectare is about 1  $\frac{1}{2}$  acres. Hence, the gross product in silk, from one and a quarter acres in mulberries, was 69  $\frac{1}{2}$  lbs. which sold for \$350.25, or about \$5 the pound, and after paying all expenses afforded to the proprietor a net profit in one year of about \$290.40.

We quote again from M. Carrier's letter: "The proprietor who wishes to occupy a plantation of mulberry trees, supposing he had already at his disposal a quantity equal to those which I stripped last spring, and in the same condition, that is, producing 160 quintals of leaves, at four francs the quintal. Well, this proprietor could have obtained from half a hectare (about 1  $\frac{1}{2}$  acres) of ground, with no other expense than that of cultivating the trees, a revenue of 640 f., or 320f. for each seteree, composed of 640 square fathoms.

"The person who would have bought this quantity of leaves, to devote himself

only to the raising of silk worms, would have had (as I did) 928 pounds of cocoons, and would have sold them at 1f. 50c. a pound, according to the course of that time: this sale would have produced 1,392f. 00c. Deduction of expenses, purchase of about 8 ounces of eggs, at 5f. the ounce, 24f. 00c.

Expenses of all kinds  
for the management 171 75  
Price of 160 quintals  
of leaves, at 4f. 640 00  
Rent of the room, 60 00

895 75

His part of the profits for 40  
days' attendance . . . . . 496 25

The filateur, who buys the co-  
coons, obtains a quantity of  
silk equal to mine, and sells  
it in the same manner, . . . 1,868 55  
He draws from the remains . . . 115 00

Total, 1,983f. 55c.

It is necessary to deduct from  
this sum, as the cost of 928  
pounds of cocoons, at one  
franc 50 c. . . . 1,392f. 00c.

Expenses of the fi-  
lature . . . . . 263 85  
1,655 85

Clear gain of the winder . . . 327f. 70c.

"The laborer, with a family, takes for his share the remains of this filature, employs his wife and children to prepare and wind the low and different qualities of silk, which are in much request and readily sold. These products can be valued, after having received all the suitable work, at . . . 165f.

Deduction for the purchase of the  
first materials . . . 50f.

Hand work, although gained by  
the family . . . . . 30

80

Profit, without including his work,  
already paid, . . . 85f.

"A simple recapitulation will make the result better understood than this division of the labor, which division certainly agrees, in many cases, with the taste or situation of persons who neither wish, nor are able, to undertake all parts of the business.

The land owner, who sells 160 quintals of  
leaves, at 4f. receives . . . 640f. 00c.

The person who buys them, and  
manages the raising, gains 496 25

The winder, who takes charge  
of the cocoons, winds them,  
and receives for his labor . . . 327 70

The laborer who works up the  
remains, does the labor for 30f.  
and gains besides . . . 85 00

Sum equal to the total profit  
which I have made by the  
union of all these operations 1,548f. 95c.

"The calculations which I have just presented, speak loudly enough without my adding the least observation to make the evidence more sure; I will only say, one of the great benefits of this direction of industry is to make a considerable mass of work for all classes of society, and for all ages."

A plantation of mulberries may soon be obtained, by procuring the young trees from the nurseries, or by sowing the seed. An ounce of seed will produce from two to three thousand plants. Sow early in May, upon a bed of good earth, well pulverized, in drills a foot apart; cover with half an inch of fine mould, compress the surface slightly with a hoe, that the soil may better

retain moisture, and come in contact with the seeds, and if the weather is dry, water occasionally, to aid germination, and to enable the young roots to get firm hold of the earth; keep the bed free from weeds, and after one or two years, prune out the plants in nursery rows, three feet apart, and in two years more they will be fit to set out where they are to remain permanently. —[Cultivator.]

**THINGS A FARMER SHOULD NOT DO.**—A farmer should never undertake to cultivate more land than he can do thoroughly; half tilled land is growing poorer—well tilled land is constantly improving.

A farmer should never keep more cattle, horses, sheep, or hogs, than he can keep in good order; an animal in high order the first of December, is already half wintered.

A farmer should never depend on his neighbor for what he can, by care and good management, produce on his own farm; he should never beg fruit while he can plant trees, or borrow tools while he can make or buy; a high authority has said, the borrower is a servant to the lender.

The farmer should never be so immersed in political matters, as to forget to sow his wheat, dig his potatoes, and bank up his cellar; nor should he be so inattentive to them as to remain ignorant of those great questions of national and state policy which will always agitate, more or less, a free people.

A farmer should shun the doors of a bank, as he would an approach of the plague or cholera; banks are for men of speculation, and theirs is a business with which farmers should have little to do.

A farmer should never be ashamed of his calling; we know that no man can be entirely independent, yet the farmer should remember, that if any one can be said to possess that enviable distinction, he is the man.

No farmer should allow the reproach of neglecting education to lie against himself or family; if knowledge is power, the beginning of it should be early and deeply laid in the district school.

A farmer should never use ardent spirit as a drink; if, while undergoing severe fatigue, and the hard labors of the summer, he would enjoy robust health, let him be temperate in all things.

A farmer should never refuse a fair price for any thing he wishes to sell; we have known a man who had several hundred bushels of wheat to dispose of, refuse 8s. because he wanted 8s. 8d., and after keeping his wheat six months, was glad to get 6s. 6d. for it.

A farmer should never allow his wood-house to be emptied of wood during the summer months; if he does, when winter comes, in addition to cold fingers, he must expect to encounter the chilling looks of his wife, and perhaps be compelled, in a series of lectures, to learn, that the man who burns green wood has not mastered the A B C of domestic economy.

A farmer should never allow his windows to be filled with red cloaks, tattered coats, and old hats; if he does, he will most assuredly acquire the reputation of a man who carries long at the whiskey, leaving his wife and children to freeze or starve at home.

There are three things of which the man who aims at the character of a prosperous farmer will never be biggantly—manure, tillage, and seed; and there are three things of which he will never be too liberal—promises, time, and credit. W. G.—[Gentle Farmer.]

NEW-YORK AMERICAN.

MARCH 21—27, 1835

Cousin's REPORT ON EDUCATION IN PRUSSIA, as translated by Mrs. Austin, and republished in this city by Wiley & Long, is a book of so much value, that we gladly make room for the annexed paper—founded on its recommendation of normal schools—by J. Orville Taylor. We wish we could induce all who either have children to educate, or any connection with schools, to read Cousin. Yet, strange to say, while a novel, frequently more likely to corrupt, than to improve, the mind, is eagerly sought, this admirable book has found few or no purchasers in this city.

SEMINARIES FOR TEACHERS.

By J. Orville Taylor.

Mrs. Austin, the accomplished translator of M. Cousin's Report on "Public Instruction in Prussia," says "there are two or three other points which I would fain recommend to the peculiar attention of the reader. One of the most important, is the absolute necessity of securing a constant supply of well-trained schoolmasters. Time and experience have, it is to be supposed, nearly removed the illusion of "mutual instruction" as a substitute for the instruction communicated by a mature to an immature mind—as an auxiliary in certain mechanical details, no one disputes its utility. Observation long ago convinced me of the entire truth of the maxim laid down by the Prussian government, and approved by M. Cousin, that, "As is the master, so is the school." There is no truth more evident than the one expressed in this maxim. The schools must from the necessity of the case be like their teachers, hence the absolute necessity of using proper means to qualify them for the profession of teaching. In this department of instruction, Prussia is far in advance of the United States. That despotic government (though at present paternal in administration) requires the teachers of elementary schools to pass through certain stages of preparation in a normal school, before they can assume the difficult and responsible station of Instructor. The organized school system in neither of our State governments, makes no such requirements. We have not till very lately given any encouragement to young men that would induce them to make suitable preparations to teach even a district school. The State of New York has just made some provision for the education of teachers; the plan we shall speak of before we close this article. There have been a few private seminaries which have made the education of teachers their principal object; but these have received no assistance from government, and have done very little towards supplying the schools of the United States. The Seminary at Andover, conducted for several years past by the Rev. S. R. Hall, has done much good, both as presenting a model for such institutions, and by sending out many able instructors. At present it seems to be generally admitted that such institutions are indispensable, and that it is the duty of the State governments to establish and sustain them.—Since we are about to open seminaries for teachers among us, it is fortunate that we have a full and faithful report by M. Cousin, of the workings of the Teachers' Seminaries in Prussia. The American edition of this work will furnish our Legislature, School Committees, and School Teachers, with instruction, not only from the highest authority, but also from the most enlightened source. While speaking of the necessity, nature, studies and benefits of seminaries for teachers, I shall avail myself of such parts of this report as will give light and interest to the subject, for says M. Cousin: "The true greatness of a people does not consist in borrowing nothing from others, but in borrowing from all whatever is good, and in perfecting whatever it appropriates."

In M. Cousin's remarks on the training of primary instructors he says, "the best plans of instruction cannot be executed except by the instrumentality of good teachers; and the State has done nothing for popular education, if it does not watch that those who devote themselves to teach-

ing be well prepared; then suitably placed, encouraged and guided in the duty of continued self-improvement; and lastly, promoted and rewarded, in proportion to their advancement, and punished according to their faults. Such is the object of title 6, of the law 1829. We translate that, as we did those which preceded. A schoolmaster, to be worthy of his vocation, should be pious, discreet, and deeply impressed with the dignity and sacredness of his calling. He should be thoroughly acquainted with the duties peculiar to the grade of primary instruction in which he desires to be employed; he should possess the art of communicating knowledge, with that of moulding the minds of children; he should be unshaken in his loyalty to the State, conscientious in the duties of his office, friendly in his intercourse with the parents of his pupils, and with his fellow-citizens in general; finally, he should strive to inspire them with a lively interest in the school, and secure to it their favor and support.

"Of the Training of Schoolmasters"—In order gradually to provide schools with masters of this character, the care of their training must not be abandoned to chance; the foundation of primary normal schools must be continued. The expenses of these establishments should be defrayed partly by the general funds of the state and partly by the departmental funds for schools."

Here Cousin unequivocally declares that the "State has done nothing for popular education" if it does not see that the teachers are well qualified. The legislature of each state should immediately make provision for the education of common school teachers. That Prussia has done this, is the whole secret of her superior schools. But teachers must not only be "prepared," they must also be, and this by the government, "suitably placed, encouraged, guided and rewarded." How far short are we of Cousin's advice and Prussia's practice!!

The establishments for educating teachers in Prussia are supported by the government funds and by the smaller and local divisions of the government. With us the school fund of each state, may erect suitable buildings, remunerate the professors, furnish a library and apparatus, and bear a part of the students expenses while preparing himself for teaching. This would give encouragement, to make teaching a study and a profession for life.

The following extract is from Cousin's report, and is translated by himself from title 6 of the law of 1819. We make this extract to show the design which the Prussian government had in establishing teacher's seminaries, or to use the Prussian name "Normal Schools." "The principal aim of the primary normal schools should be, to form men, sound both in body and mind, and to imbue the pupils with the sentiment of religion, and with that zeal and love for the duties of a school master which is so closely allied to religion." It is seen that their design is to make their pupils men, in knowledge and in person, and not only this, but religious men, and men in love with their business. The next extract designates the length of time to be spent, and marks out the course of studies to be pursued in these seminaries.

"In each primary normal school the length of the course shall be three years, of which the first is devoted to supplemental primary instruction, the second to specific and more elevated studies, and, the third to practice and occasional experiments in the primary school annexed, and in other schools of the place. When the supplemental instruction is not required, the course may be reduced to two years."

The plan proposed for this State in the report of, and adopted by, the regents of the University, is to select one academy in each of the eight Senate districts of the State; to appropriate five hundred dollars to teach, for the purchase of a library and apparatus adapted to the use of those who are preparing to be teachers, thus reserving six thousand dollars out of the permanent fund of ten thousand dollars now on hand, for future contingencies; and from the annual surplus revenue of the literature fund, (estimated at three thousand five hundred dollars,) to appropriate four hundred dollars to each of the Academies, to provide a special course of instruction in the art of teaching.

The following academies have been selected for this purpose.

For 1st Dist., Erasmus Hall Academy, King's Co.,  
 " 2d " Montgomery " Orange Co.,  
 " 3d " Kinderhook " Columbia Co.,  
 " 4th " St. Lawrence " St. Lawrence Co.,  
 " 5th " Fairfield " Herkimer Co.,  
 " 6th " Oxford " Chenango Co.,  
 " 7th " Canandaigua " Ontario Co.,  
 " 8th " Middlebury " Genesee Co.,

In regard to the course of study to be pursued, it is remarked in the report, that the *standard* should be raised "as high as possible," because "the qualifications of those who follow it will incline to range below, and not above, the prescribed standard." It proposes that none should be allowed to enter on the course, who are not acquainted with reading, writing, arithmetic, grammar, and so much of geography as is found in the duodecimo works on this subject, usually studied in our schools. The following are the subjects of study proposed for the teachers' course, which are required to be thoroughly taught, and while they are not intended to exclude others, shall not be allowed to give way to any.

1. The English language.
2. Writing and Drawing.
3. Arithmetic, mental and written; and Book-keeping.
4. Geography and general History, combined
5. The History of the United States.
6. Geometry, Trigonometry, Mensuration and Surveying.
7. Natural Philosophy and the Elements of Astronomy.
8. Chemistry and Mineralogy.
9. The Constitution of the United States, and the Constitution of the State of New York.
10. Select parts of the Revised Statutes, and the duties of Public Officers.
11. Moral and Intellectual Philosophy.
12. The Principles of Teaching.

Although the Regents have not excluded other studies than those contained in this programme, yet I am surprised that Botany, Zoology, and Agriculture, and even Physiology, are not included.

What more interesting and useful studies for our young farmers than Botany, Zoology, Agriculture? And how important is it that they should have teachers who are well acquainted with these departments of Natural History.—Composition likewise is not mentioned; one of the most important parts of every man's education.

To secure the services of those who have been educated by the State, to make such follow the business of teaching as a profession for life is the most difficult thing of this part of Legislation. The graduates of Teacher's Seminaries will be qualified to demand a much higher compensation for their services, than the employers of district schools will feel disposed to give them: and unless there is something to prevent, the laborers will go where they are best rewarded. There are two ways of securing the services of those who have been educated in the teacher's seminary. The first is, by creating a disposition in parents to reward their teachers with an adequate compensation. If parents are disposed to pay these teachers as much as they will be able to get at any other employment, they will secure them as teachers; but they will not teach unless parents pay more than they do at present. This rests with parents; and we do hope that they will adequately reward those who have spent much time and money in preparing themselves to teach.

The other way is adopted by Prussia. I think the feelings of the people and the spirit of our government would forbid this. I do not think that it can be adopted in this country. It may perhaps in part. The following extract from Cousin will show the laws regarding those who have been qualified to teach by the government. "Every pupil of a normal school is obliged, at the expiration of the term, to accept the master ship to which the provincial consistories may appoint him; the prospect of advancement being, however, always set before him as the consequence of continued good conduct." This compels every one who is competent to become a schoolmaster. If they are not competent, they

are either rejected altogether or sent back to review their studies. This will be seen in another part of the same work referred to above.

"Every young man whose competency is admitted shall receive a certificate, delivered and signed by the whole commission, his examiners, by their president, and by the head master of the primary normal school or other establishment in which he was trained to his calling. It must state his moral character, and his degree of aptitude for teaching, such as prove incompetent shall, by a formal decree, be wholly rejected, or sent back to continue their studies."

The Prussian government is careful not to admit those into the normal schools who are physically or morally disqualified from making good teachers. To show this we make another extract from Cousin.

"The normal school is by no means designed for those who are unfit for any business, and think, if they can read and write, they are capable of becoming schoolmasters. This notion is so deeply rooted, that you hear fathers declare with all the simplicity in the world—"My son is too delicate to learn a business," or "I don't know what to make of my son, but I think of getting him into the normal school." We reply to such, that the pupils of the normal school must, on the contrary, be sound both in body and mind, and able to brave the toils and troubles of a career, as laborious, as it is honorable. Much neglect unfortunately, still exists, on a subject which is of the highest importance, the methodical preparation of these young men for the calling which it is desired they should embrace. A false direction is often given to their preliminary studies. A young man is believed to be well prepared for the normal school, if he have passed the limits of elementary instruction, and if he have acquired a greater mass of knowledge than other pupils. It frequently happens, that candidates who come strongly recommended from school, pass the examination without credit, or are even rejected. The most immediate and the most important aim of all instruction, is to train up and complete the Man; to awaken the energies of his soul, and to render him not only disposed, but able, to fulfil his duties. In this view alone can knowledge and talents profit a man; otherwise, instruction, working upon sterile memory and talents purely mechanical, can be of no high utility. In order that the teacher, and particularly the master of the primary school, may make his pupils virtuous and enlightened men, it is necessary he should be so himself. Thus, that the education of a normal school, essentially practical, may completely succeed, the young candidate must possess nobleness and purity of character in the highest possible degree, the love of the True and the Beautiful, an active and penetrating mind, the utmost precision and clearness in narration and style." The board of examiners connected with our seminaries may obtain some valuable hints from the preceding extract.

Attached to every teacher's seminary should be a department for teaching the elementary branches of an English education. This is necessary that those who are preparing to teach may make a practical application of their instructions. On "Practical Teaching" hear Cousin. "All the studies and all the knowledge of our pupils would be fruitless, and the normal school would not fulfill the design of its institution, if the young teachers were to quit the establishment, without having already methodically applied what they had learned, and without knowing by experience what they have to do, and how to set about it. To obtain this result, it is not sufficient that the young men should see the course gone through under skillful masters, or that they should themselves occasionally give lessons to their school-fellows; they must have taught the children in the annexed school for a long time, under the direction of the masters of the normal school. It is only by familiarizing themselves with the plan of instruction for each practical branch, and by teaching each for a certain time themselves, that they can acquire the habit of it without method."

At St. Louis, (Mo.) at 8 o'clock on the morning of the 7th Feb. the mercury stood at 18 degrees below zero, and on the morning of the 8th, at the same hour, it was down to 22 below zero.

## SUMMARY.

Congress at its last session adopted a resolution that a gold medal be presented to Col. Croghan, and a sword to each of the officers under him for their gallantry and good conduct in the defence of Fort Stephenson, during the late war. To the ability and bravery of Col. Croghan and those under him on this occasion is ascribed the discomfiture of the British plans on Lake Erie in 1813. But for the gallant defence of Fort Stephenson the military stores of the American Army and the fleet with which Perry afterwards gained his glorious victory would have fallen an easy prey to the British. The defence of the Fort was not only one of the most brilliant, but it was also one of the most important achievements of the war. The names of his companions to whom, or their eldest male heirs, swords have been voted are, Capt. James Hunter, Lieut. Benjamin Johnston, Cyrus A. Baylor, John Meek, and Ensigns Joseph Duncan and Edmund Shipp. [Baltimore American.]

*Cylinder Cannon.*—Messrs. Allen & Ball, of Springfield, Mass., have invented what they call a cylinder cannon; upon the cylinder may be placed as many barrels as may be desired, each barrel capable of making two discharges a second. It was built for a company in Lowell, who have procured a patent in this country and France, and have now an agent in England for the purpose of getting it patented there. "It was to us, says the Hamden Whig, "altogether a novel piece of machinery, and the idea of a cannon being fired, gun after gun, by an operation like that of a boy turning a grindstone, struck us as strangely singular."

The Spanish authorities at the Island of Porto Rico have subjected American, in common with other foreign productions, to an increase of duties, amounting almost to prohibition.

*The Antiquaries Humbled.*—The British Museum recently purchased a splendid specimen of the Saurian or lizard tribe, one of the "monsters born before the flood," and paid for it the sum of \$2500. It has been proved within a few weeks to be an ingenious fiction, in plaster.

If a certain contingency takes place in relation to the present Royal Family of England, the Queen would become, on the death of the King, Regent of the Kingdom, by a law passed in 1830. 1 Wm. 4, Chap. 2d.

There is Iron enough in the blood of 42 men, to make a ploughshare weighing 24 pounds. The quantity of Brass in their faces cannot be ascertained with accuracy. [Buffalo paper.]

*Marrying Daughters.*—The Spaniards say—"at eighteen marry your daughter to her superior at twenty to her equal—at thirty to any body that will have her."

[From the *Barbadian*, February 7.]

We have this morning received by Mail boats papers from the colonies of Demarara, Tobago, Trinidad, Grenada, and St. Vincent. The apprenticed labourers seem to be acting their parts well every where except in Demarara.

The Cincinnati papers mention the death of the venerable Bishop McKENZIE, of the Methodist Episcopal Church, which occurred on the 5th instant. Nothing is said of the place or cause of the Bishop's demise.

Among the business transacted by the Legislature of New York, is the permission given to Posteritas Pope Benton, to take and use the name Posteritas Benton for ever. They should have made his first name last. [U. S. Gazette.]

*The Duke of Wellington's Father.*—The first and last Lord Mornington (Garrett Wellesley) had always a strong partiality for the harpsichord, and contrived to steal intervals of practice in spite of his sister's assertion that he only spoiled the instrument. His father about this time declaring his intention of having an organ for his chapel, Garrett undertook to officiate as organist the moment the instrument should be finished. This was accomplished in less than a year and a half; and at the expiration of that period he sat down at the maker's, and played an extempore fugue, to the astonishment of all present, who did not imagine that he could have executed a bar of a single tune. [The Georgian Era volume IV.]

*The Quarrels of Benevolence.*—The following is a liberal exemplification of the doctrine of provoking one another to good works. We take it from the Cazenovia, New York, Monitor:

A strife, of rather an unusual character, was carried on in Buffalo, during the last cold weather. The Mayor, Ebenezer Johnson, gave public notice in the city papers on the 10th February, that he would furnish 25 cords of Wood to such poor families as were unable to supply themselves, with a proviso, that "none need apply whose poverty has been caused by intemperance."

This brought out Manly Colton, Esq. on the 18th, who gave a like notice, that he would give "to the shivering mothers and children of the city, who have become poor and destitute in consequence of the beastly crime of intemperance on the part of their protectors," 25 cords of Wood.

The next day, O. H. Dibble gave notice that he would furnish 25 cords of wood to such families as were unable to purchase it, without requiring them to prove either that are they "beastly drunkards," or "that they have never expended money in intemperance."

The day following, Samuel Twitchell, jr. offered to give 25 cords of wood to such as were destitute, and unable to purchase, "no matter from what cause they became so."

On the same day, Alanson and Julia Palmer announced, that they would give one hundred dollars, in provisions and clothing, to the needy. They say, "It is enough for the applicants to be poor—we wish not to know the cause of their misfortune, but wish all to be temperate, industrious, and happy."

John Wheelock, a butcher, also gave notice on the same day, that he would give to the suffering poor of the city, 25 rounds of beef, for every cord of wood that the Mayor should furnish—and would "not go into a detailed examination of how they became needy."

*GREEK FIRE.*—Constantinople was indebted for her preservation to a new and fortunate discovery which chemistry accidentally opened to the Greeks at a time when there was neither courage, patriotism nor talent in either commander or men sufficient to repel so formidable an enemy. An inhabitant of Heliopolis, (there were two towns of that name, one in Syria, the other in Egypt,) named Callinicus, discovered a composition of naphtha, or oil of bitumen, pitch, and sulphur, which, once set on fire, could not be extinguished by water; which adhered to wood with destructive activity, and consumed with equal facility a single ship or a whole fleet; and which, when thrown on the combatants, insinuated itself between the joints of their armour, and destroyed them by a death of torture. Callinicus, a subject of the khalifa, but a Christian, brought his secret to Constantinople and used it in defence of Christendom. This secret was preserved till the middle of the fourteenth century, when it was superseded by the still more tremendous invention of gunpowder. Its qualities are very imperfectly known to us. The Greeks called it "liquid, or marine fire." The prows of vessels and the ramparts of towns, were furnished with tubes by means of which this blazing oil was thrown to a large distance; a piston projected it with great velocity into the air, as soon as it came into contact with which, it became ignited by some process unknown to us; the devoted victims saw it approaching in the form of a fiery serpent, till at last it fell in a burning shower on vessels and men. An hour's fight would cover the sea with this flaming oil, and give it the appearance of a sheet of fire. The Saracen fleets were repeatedly destroyed by it, and their most valiant warriors, whom the near aspect of death had never daunted, recoiled from the terrors and tortures of this liquid, which crept beneath their armour and clung to every limb. [Lardner's Cyclopaedia.]

Discovery of a Sinking Vessel.  
DRUNKEN FRENZY.

The Eddystone light was just dipping on the verge of the horizon, when the bright flash of a gun was seen broad on her starboard bow, which was quickly succeeded by another. Old Blowhard had the watch, and it was immediately reported to the Captain. "Can you make out any

thing with your glass, Master?" inquired the skipper. "No, Sir," returned the old man, "nor have we heard the reports, which makes me think it must be some vessel in distress."—"What rate is she travelling at, Mr. Blowhard?" asked the Captain. "The mate of the watch has just hove the log, Sir," replied the Master, "and she was going eight and a half; but I'm thinking, Sir, with a head sea, we cannot give her more than eight knots." "By hauling up a point or two, it will throw us more to the windward, certainly," said the Captain, speaking to himself, "and if there are fellow creatures in danger, it would be cruel to leave them to perish. Still my orders are positive not to be turned out of my course for anything. Do you really suppose, Mr. Blowhard, that it is some craft in distress?" "It is not possible for man to say for sartin," answered the Master, "but I've been all my life upon the ocean, Sir, and it seems to me as if the Creator had given the creatures he designs to witness his wonders on the deep a nat'ral instinct to discover many things that are not revealed to the outward eye; and so when I saw the flashes, it seemed to strike my mind that they came from one who needed a friend." "Haul up in the direction, Master," said the Captain; "I'll be on the deck directly." "Aye, aye, Sir," replied the old man; "we shall soon make out what it is." He closed the cabin-door and ascended to the deck. "The watch trim sails—starboard cat-head there! have you seen any more flashes?" "Yes, Sir," answered the man, "and there seems to be a sail in that direction." "Why, where else should a flash come from you lubber?" grumbled the master: "you may run upon that course till the card of the compass aches itself end for end, and never touch a bit of land large enough to grow a gouseberry-bush! Brace up the yards!" he vociferated through his speaking trumpet; "get a pull of the main fore sheets; trim the jib there, forud! and after-guard, haul in the boom sheet. Port, boy—port a little." "Port it is, Sir," replied the man, putting the tiller to leeward: "shall I bring her to the wind, Sir?" "Yes, luff her up, boy! full and by; remember so as to let her walk. Forud, there! steady the weather leeches by the bow-lines—tant d'ye hear? Keep a good look-out before for the stranger, and don't let your eyes get plugged up with your night-caps." At this moment the Captain made his appearance on the quarter-deck. "We must have the hands up, Mr. Blowhard; for if we hug the wind, we shall want another reef in the topsails. Quartermaster, how does she head?" "W. N. W., Sir, clean cap full," answered the man; "and I just seed a flash about a point to leeward of the bowsprit end."

The hands were turned up: every soul took his station; and as mine was on the forecastle, I directed my eager gaze towards the point where the stranger was supposed to be; but I could make out nothing, so very dark was the night. The top-gallant masts were bending like coach-whips, and the sweet little brig was dashing along the seas, and throwing aside the waters like a grampus in sport. "Do you see any thing of the stranger, forud?" hailed the Captain. "No, Sir," replied I; but at the very moment I had answered, another bright flash broke out of the gloom, and a heavy report of a gun came sullenly booming over the dark waters, and was borne away to the leeward on the gale. "There's another gun!" I exclaimed, "and she must be about a point and a half under our lee, as we are heading now." "Keep her W. b. N.," cried the Captain to the helmsman; "Mr. Derrick, let them give her a foot or two of the sheets." The brig felt the freedom she was enjoying, and bounded away at a more rapid pace. "Man the fore and main clew garnets, and the 'gallant clew lines," continued the skipper; "and before the watch is called again, Mr. Derrick, we'll double-reef the topsail. A good look-out, before, there!"

The "aye, aye, Sir," had scarcely been uttered, when I discovered a dark log-like object, occasionally appearing and disappearing as it rose on the summit of a sea, or sunk into the hollows between the rolling waves; it laid directly a head of us, and we heared it so rapidly, that I had barely time to sing out "up with the helm—keep

her away!" and have the order obeyed, before we had shaved the hull of a large vessel so close that our weather-quarter was struck by the stump of his bowsprit—the only remnant of a spar they had left standing. The shock staggered us for a moment or two; but the Captain's voice shouting "up courses—in top-gallant sails—square away the main yard," aroused the people; the sails were reduced, and the brig came up to the wind on the starboard tack; but having ranged a considerable distance away from the stranger, we wore round, and passed under his lee. "Ho, the ship a-hoy!" bellowed the Captain. "Halloo!" was the response. "From whence came you?" inquired the skipper. "From Goree, on the coast of Africa," was the reply. "Where are you bound to?" continued the Captain; "mind your weather-helm, boy, she's running up into the wind's eye. Where are you bound to?" "To the bottom unless you'll take us aboard," answered the person addressed; "our hold is filling fast, one of the pumps is choked, and the men are completely worn out." "Hoist the boats out, Mr. Derrick, and come aft here, and lower the jolly-boat down," said the Captain. The orders were promptly obeyed, and I was directed to board the stranger and act according to circumstances. There is something peculiarly affecting in viewing a mastless vessel rolling her heavy sides in the trough of the sea, with nothing aloft to steady her: it is a melancholy spectacle, awakening the most painful emotions in the mind of a seaman; and I felt it so when I had reached her deck, and found the sky every where above me without a rope yarn to checker the dreary monotony of the blackened clouds that flew noiselessly on the wings of the wind. The seas beat over the devoted vessel as she rolled her gunwales in, and the phosphoric light of the salt water glistened like a thousand stars, as if the waves in mockery would array their victim in bright gems previous to the sacrifice. Yet what a strange compound is man! In the midst of this devastation, whilst the grim king of terrors was threatening to break the hour glass of time to many a hapless being, the man who, above all, should have retained his self-possession—the master of the ship—was beastly drunk.

The mate informed me that her name was the Neptune, of Liverpool; they had visited the coast of Africa and had collected a valuable cargo of ivory, some sort of wood (I forget the name) used in dyeing, and gold dust; they had lost their masts during the gale of the preceding days. "And is there no chance of saving her?" said I; "whereabouts is your leak, and how much water have you in the hold? A lantern here, my lads, and bear a hand with it." "It's of no manner of use, Sir," replied the mate. "Hark for a moment, and you'll soon discover she's near her flury, if you are any way skilled in the death-moans of a sinking ship."—There certainly was something extremely appropriate in the term "death-moans," for the struggling of the water against the pentup wind in the hold did produce sounds like the groans which may be supposed to proceed from a strong giant in the last convulsive pangs of expiring existence. Nevertheless I was determined to examine into the state of the vessel myself, as I had heard much of the tricks employed to cheat the underwriters, though in the present instance there certainly was nothing to lead any one to entertain the least suspicion but that the whole had been caused by the violence of the weather, to which also might be added the neglect of the master, through confirmed habits of intemperance. Calling Peters to my side with a lantern, I went down below, had the hatches removed, and found the hold was fast filling from the pumps having been totally deserted. "Well, I'm blessed, Mr. Oldjunk," said Peters, "but I should like to get a little gold-dust, for they tell me it's a capital thing to clean the teeth with; and, talking about teeth, my dear eyes, do look at them elephant's tusks and what not, as Mr. Warner would say. Arn't it a pity they should all go to the bottom? Well, I'm blowed, if old Davy won't have enough in his locker to set up a dentist's shop for whales, and such like; and there's some on 'em big enough for the krakeens off the North Cape. Do, pray, Sir, let me take

half-a-dozen aboard for Mr. Blowhard—he's rather short of ivories, and I could pick 'em out just to fit his jaw?" "Be silent, Peters," said I, "and attend to your duty; this is no time for cracking your jokes!—see, the water rises fast. Away there on deck all of you, and bear a hand into the boats." I soon became sensible of the utter impossibility of saving the ship, and therefore directed the whole of my attention to the preservation of the men, especially as the greater part of them were more or less in a state of intoxication, and, with the characteristic recklessness of sailors, were getting up their bags, instead of thinking about the immediate danger that surrounded them. I had not seen the master, but descending the companion, I entered a very handsome cabin panelled with mahogany, against which the bright cutlasses, bayonets and pistols were arranged in exact and pretty order; a noble pier glass was affixed to the rudder case, and the curtains of the bed-places as well as those of the stern windows were tastefully festooned with green silk. The master was on his knees scrambling against the bulk head, (and receiving many a severe bruise as the heavy vessel rolled, endeavoring to get hold of one of the numerous weapons, and at the same time muttering blasphemous curses against himself, his men, and even his Creator. He had contrived to pull down a bayonet which laid by him on the deck, the point having become fixed in the timber, which secured it from fetching away. I directed some of the people to remove him upon deck, but he grasped the bayonet and tried to raise himself up, swearing, "No d—d man-of-war's man should usurp his authority," and that his men were a set of mutinous dogs, who had deserted him." He then called to the mate and ordered him "to hoist the jack forud for a pilot." To reason with a wretched creature in his state was useless, and therefore I had him seized and carried up the companion. Nothing could exceed the horror of his look when the light from the lantern flashed upon his face, and, supported by two men who seated him on the sky-light, he beheld his vessel—that beautiful creature which a few hours before stemmed the waves in grandeur—now a complete wreck: it sobered his reason for the moment, but only for the moment; a yell of bitter anguish escaped him, and reason took her flight; for he became a perfect madman, and his ravings were dreadful to hear, whilst the violence of his paroxysms rendered it very difficult to hold him fast. Under all circumstances I did not think it prudent to secure his arms and legs by lashings, as, in case of accident, he would have been entirely deprived of the powers of self-assistance; but I determined to pinion him the moment we had got away from the ship, as his unceasing struggles might endanger the safety of the whole; but his own conduct rendered my intentions unavailing. I was holding on at the gangway, and hurrying the ship's crew into the boats, when a cry from Peters aroused my attention, and, turning my head a little, the wind, from a heavy blow aimed with a handspike, came rushing down upon me, and the next instant the maniac master, overpowered with the force of his own exertions, and missing the resistance which he would have met with had his design taken effect, darted over the side head foremost into the sea—the roil of the ship throwing him beyond the boat that laid alongside. Every exertion was made to save him, but without avail: he arose after a short distance, as we could judge by the commotion in the water, and then disappeared forever. The spectacle that had just been witnessed rendered the ship's crew more tractable, and, after some difficulty, I got them all into boats except one man who could not be found, and it was conjectured he had fallen into the hold and been drowned; but after we had shoved off we could hear the most piercing shrieks, and I was about to put back when the heavy mass rolled into the sea, an explosion like the discharge of artillery succeeded, and the following wave curled up its head upburthened—she had gone down. We were soon on board the sloop, the boats were hoisted in, and the brig kept away S. W. with as much canvas as she could stagger under, and by daylight we were well in with Ushant, running at the rate of ten knots an hour.

A true copy. GIBSON HAWLEY,  
Secretary of the University.  
Albany, Feb. 26th, 1835.

New Census Law.

As set to amend chapter third, part first of the revised statutes, entitled, of the census and enumeration of the inhabitants of the State, Passed March 16, 1835.

The people of the State of New York, represented in Senate and Assembly, do enact as follows:

§ 1. It shall be the duty of the Secretary of State, so to extend the blank returns for enumerating the inhabitants of this State, contained in chapter third, part first, of the revised statutes, that the blank returns of this State shall hereafter be enumerated in the same manner as is now provided by said chapter for the enumeration of the deaf and dumb, and also the number of glass factories, rope factories, chain cable factories, all cloth factories, dyeing and printing factories, savor mills, paper mills, tanneries, breweries, and the quantity and the value of the raw material manufactured in each, and the value of the manufactured article manufactured in each the preceding year, together with the quality and value of the raw material, and the manufactured article used and manufactured the preceding year in such other manufactures as are enumerated in the revised statutes.

§ 2. The Secretary of State is hereby authorized to forward to the clerks of the different counties, the blank returns and copies of the third chapter of the revised statutes, together with a sufficient number of copies of this act, in such manner as he may deem proper, instead of transmitting them by mail, as required by the third section of said chapter.

§ 3. This act shall take effect immediately after its passage.

FRANK'S MAGAZINE.—In an article entitled "The Songs of Italy," we find a translation of Petrarch's sonnet to the Fountain of Vaucluse, so beautiful that we cannot refrain from extracting it.

Visions of love 'ye dwell  
In memory still enshrined.—  
Here, as the waves retired,  
A shower of blossoms on her bosom fell;  
And while th' enamored tree  
From all her branches, then  
Bathed odoriferous,  
She sat, unconscious, all beauty.  
Mist with her golden hair, those blossoms sweet  
With perfume made sweet;  
There their elegiacs dwelt

Due to her flowing robe and lovely feet:  
Unborn, departing took  
Their course above the breast:  
Others slept, waited in airy space,  
Seemed to prophesy, "To-day Love shall his merry court!"

TO —

Ou, tell me not of dunes or song, of banqueting or ball,  
Or of the bright eyes beaming round thy fairy festival;  
Oh, tell me not those eyes were blue and holy "like the light  
Of celestial things and stary skies," or dark eyes still  
more bright.

Oh, tell me not of very eyes, of sunny smiles that weave  
Their spell of deep enchantment round—the brightest may  
deceive:

Oh, tell me not of braided hair, of spirits bright and free,  
They speak of earth and happiness, and what are those to me?

Oh, tell me not of spring's bright flow'rs, I've seen them all  
deceitful:  
Have seen the winds of autumn come and sweep them far  
away:

And they who watch'd them in their pride of beauty, can  
they tell

Where now may be the dwelling place of all they lov'd so  
well?

Oh, tell me not of rattle-bird's mirth, the murmur of the bee,  
Or the glad song of tawny birds, for what are those to me?  
They do but speak of wealth'd hours of happiness that's o'er  
Can reach the heart when blyth and wrong are darkly  
brooding there.

Oh, tell me not of happy hours,—you little know the sting  
The burning thought of agony that little word can bring.  
The dearest bird that tries its wing can find at eve a nest,—  
How weary in the spirit, then, that finds no place of rest:

Oh, tell me not of starlight hours, oh, tell me not of love  
Oh, tell me not how bright the moon is beaming from above:  
Oh, tell me not of youth and hope, but look upon my brow,  
And tell me if those words are chosen one dark shade from  
I know.

Then tell me not of all these things, nor wonder if I seem  
To thee a thing so "changeling"—remember where the  
stamps

is deepest, there 'tis darkest too, and e'er its gloomy breast  
The sun's bright rays may glance awhile, but never, never  
rest!

ELIZA.

AGENTS FOR NEW PUBLICATIONS.

HENRY G. WOODBULL, of Westchester, Montauk  
county, New York, is agent for the following Publications:  
The New York American Daily, at \$10.00—Tri-Weekly,  
at \$5.00—Semi-Weekly, at \$4.00 in advance.

The American Railroad Journal, Weekly, at \$2.00 per  
annum.

The Mechanic's Magazine, two volumes a year, at \$2.00  
per annum.

The Quarterly Journal of Agriculture and Mechanic,  
at \$2.00 per annum, or \$1.25 per number.

The Family Magazine, 416 pages a year, at \$1.00 in ad-  
vance.

The Monthly Repository and Library of Entertaining  
Knowledge, of 36 pages a month, at \$1.00 in advance,  
now in the 1st volume, bound volumes \$1.25

The Ladies' Companion, of 34 pages a month, at \$2.25  
per annum, in advance.

The Rochester Gem, at \$1.50 in advance.

All Communications addressed to me, at Westchester  
Montauk county, will be promptly attended to. September  
15, 1834.

SUPERIOR

GARDEN AND AGRICULTURAL SEEDS.

The Subscriber has now on hand a full  
supply of Garden and Field Seeds growth  
of 1834; among which are all the finest cab-  
bages, cauliflowers, broccolis, radishes, peas,  
&c., that are cultivated in England, France,  
and Holland, together with every sort that can be raised to  
advantage in our own country, and which are grown ex-  
pressly for my use from stock furnished and raised by the  
most experienced gardeners in this country; in short, every  
article emanating from my store I warrant genuine  
and fresh.

Also, skinkless oats, potatoes extra, 44 lb. weight to the  
bushel, perennial rye grass, white clover, lucerne or  
French clover, orchard grass, hard's grass, white mul-  
berry, and yellow locust seeds, spring tares or vetches,  
genuine mangel warts, and ruta baga, and field turnip,  
which will worth the attention of farmers.

Onions, Hemp, Flax and other seed; wholesale  
dealers supplied on accommodating terms. Price lists by  
the pound and bushel furnished on application, so also  
catalogues of whole collection.

The flower seed department embraces the choicest vari-  
ety to be found in this country, in which are included  
choicest double dahlias, double carnations and choice  
Pinks, German and China Anemones, splendid double bel-  
adams, with an addition of several new varieties, accompa-  
nied with a printed direction for culture and management.

Orders will be punctually attended to and carefully  
packed and forwarded as directed, but as the collection of  
distant debts are often troublesome and sometimes imprac-  
ticable, it is desired that satisfactory reference be made to  
persons in Albany, when the order is not accompanied  
with the money.

W. THORNBURN,  
347 N. Market st. (opposite Post Office.)

\* Mr Thornburn is also Agent, as well as all those re-  
ceive subscriptions, for the New York Farmer and  
American Gardener's Magazine; QUARTERLY JOURNAL of Ag-  
riculture, Mechanics, and Manufactures; MECHANIC'S  
MAGAZINE and Repository of Inventions and Improvements;  
and the AMERICAN RAILROAD JOURNAL and Advocate of In-  
ternal Improvements; published at No. 35 Wall street, N.  
Y., by D. E. Muzz.

RAILROAD CASTINGS.

MARY & WARD, Proprietors of the Albany Eagle  
Alb. Furnace and Machine Shop, will make to order all  
wheels, shafts and knees, and every other description of  
castings required for the railroad. N.Y. 1834

SURVYORS INSTRUMENTS.

Compasses of various sizes and of superior qual-  
ity warranted.  
Leveling instruments, large and small sizes, with high  
magnifying powers with glasses made by Troughton, in-  
gubet with a large assortment of Engineering Instru-  
ments, manufactured and sold by  
E. & O. W. BLUNT, 124 Water Street,  
corner of Maiden Lane.

JAN 6

STEPHENSON,

Builder of a superior style of Passenger Cars for Rail-  
road,  
No. 206 Elizabeth street, near Blocher street,  
New-York.

RAILROAD COMPANIES would do well to  
examine these Cars; a specimen of which may be seen  
on that part of the New-York and Harlem Railroad  
now in operation. JAS 15

RAILROAD CAR WHEELS AND BOXES,  
AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels  
complete at the Jefferson Cotton and Wool Machine  
Factory and Foundry, Paterson, N. J. All orders ad-  
dressed to the subscriber at Paterson, or 60 Wall  
street, New-York, will be promptly attended to.

Also, CAR SPRINGS.  
Also, Flange Tires turned complete.  
JAS ROGERS, KETCHUM & GROSVENOR.

Any person desiring further information, or to purchase,  
will please to call at the machine shop of Mr. John Ham-  
phrey, in the village of Landingburgh.  
August 15, 1833. ASH & EMAY

MILL DAM FOUNDRY FOR SALE.

The Proprietors of the Mill Dam Foundry offer  
only or lease their well known establishment, situated up-  
on the Mill Dam, in the town of Westchester, N. Y.  
The improvements consist of:  
No. 1. Boiler House, 30 feet by 30 feet, containing all  
the necessary machinery for making bottom for Locomotives  
and other steam Engines.

No. 2. Blacksmith's Shop, 30 feet by 30, fitted with cranes  
for heavy work.

No. 3. Locomotive House, 34 feet by 35, used for putting  
together Locomotive Engines. Several of the best Engines  
in use in the United States have been put in this establish-  
ment.

No. 4. A three story brick building, covered with slate,  
130 feet by 44, containing two water-wheels, equal to 40  
horse power; Machine Shop, fitted with lathe, &c.; Pattern  
Shop, Rolling Mill and Furnace, capable of rolling 4 tons  
of iron per day, exclusive of other work; three Trip  
Hammers, one of which is very large; Engines for blowing  
Cupola Furnaces, moved by water-wheel; one very super-  
ior 12 horse Steam Engine, which could be disposed  
with; and a variety of other machinery.

No. 5. An Iron Foundry, 60 feet by 45, with a superior  
air Furnace and two Cupolas. Cast iron, Cast steel, &c. fitted  
for the largest work. Attached to the Foundry is a large  
ware-house, containing Pattern for the Casting of  
Hydraulic Presses, Locomotives and other Steam Engines.  
Lead Mill Rolls, Gearing, Flasks, shovels, Grates, &c. &c.  
These were made of the most durable materials, under the  
direction of a very scientific and practical Engineer, and  
are supposed to be of great value.

No. 6. A building, 45 feet by 35, containing a large stock  
of chimneys, and furnaces, for making Cast Steel. This  
building is at present used as a boarding-house, and can  
accommodate a large number of guests.

No. 7. A range of buildings, 300 feet long by 35, con-  
taining counting room, several store rooms, a Brass For-  
dery, room for cleaning castings, a large loft for storing  
timber, stable for two horses, &c. &c.

The above establishment being on tide water, presents  
greater advantages for some kinds of business than any  
other in the United States. Coal and iron can be carried  
from vessels in the harbor of Boston, to the wharf in front  
of the Factory, at 25 to 30 cents per ton. Some of the  
largest jobs of iron work have been completed at this estab-  
lishment; among others, the great chain and lift pumps  
for freeing the Dry Dock at the Navy Yard and Charleston.

The situation for Railroad work is excellent, being in  
the angle formed by the crossing of the Providence and  
Worcester Railroads. The Locomotive "Yankee," now  
running on the latter road, and the "Jonathan," purchased  
by the State of Pennsylvania, were both at these works.  
With the Patterns and Machinery now in the premises, 15  
Locomotives and as many tenders, besides a great quantity  
of cars and wagons, could be made per annum.

For terms, apply to  
THOMAS ECKLEY, Treasurer, &c., Boston, or to  
ROBERT BALSTON, Jr., Philadelphia.  
Boston, Dec. 20, 1834.

(From the New-England Farmer.)

**COLD WEATHER.**—The facts stated by Mr. Breck, in your paper of January 14, respecting the difference of cold on the high and low land in still cold weather, are undoubtedly true, although I am not aware that it has been generally known. I have conversed respecting it for many years, but have found almost all persons incredulous.

My house is elevated from fifteen hundred to two thousand feet above tide water. And I learned from my feelings, many years since, that in still cold weather, the cold in the night and early in the morning was much more intense in the valleys than on the high lands. I have many times left my house at sunrise, when the cold was not uncomfortable, and in an hour descended a thousand feet, where I found the cold very intense. I have as often, in very cold still evenings, when the weather was constantly growing colder, ascended from the same valley, when I was almost frozen, and constantly as I ascended grew warmer until I came to my house.

Every person acquainted with the business of making maple sugar, knows that frost is necessary to the manufacture of it. The sap will not run from the tree more than twenty-four hours after it is thawed, until it is again frozen. In the sugar season, which is in this country from the middle of March to the middle of April, the trees are generally frozen in the night and thawed in the day, when the sap runs. In one fourth part of the year, there are many days in succession in which no sugar is made very near me from the want of frosts. Whereas, at the same time, people living not more than six hundred rods distant, but on ground a few hundred feet lower, make it constantly with great success. This happens only in still, calm weather. This circumstance cannot lie, however variant and improper the construction of thermometers may be.

I now come to the observations made on different thermometers, and I can only compare those in this vicinity, except so far as they have been communicated from different places this winter.

I will first remark, that my thermometer generally indicates a less degree of heat, or greater degree of cold, than the thermometers in the valleys in this vicinity. The average difference for this year is six to seven degrees.

I see it stated in your paper of Jan. 14, that the thermometer at Montpelier, in Vermont, stood on December 26th, in the morning, at 28 degrees below zero. Of this I had heard before. Mine, which is also Fahrenheit, stood at 11 degrees below; a difference of 17 degrees. I am eleven miles from Montpelier, and elevated probably twelve or fifteen hundred feet above that place.

At 9, P. M., of January 3d, my thermometer was at 20 degrees, and at sunrise of the 4th, it was 23 degrees below zero. At Montpelier that morning, the mercury was frozen, as it was also in another valley four miles from me. In another valley, in a different direction, five miles from me, the thermometer was 40 degrees below zero. This last thermometer, by a comparison, ranges exactly with mine. The two last mentioned valleys are, probably, a thousand feet below me. On the morning of January 11th, my thermometer was 14 degrees above zero. In the valley five miles from me, it was 11 degrees below at the same time, and the same at Montpelier, a difference of 25 degrees. On the morning of January 12, mine was 16 degrees above

zero. In the valley five miles from me, it was 10 below; a difference of 25 degrees.

Mr. Breck put his thermometer, on the morning of Jan. 10, at 14 degrees below zero; mine was seven above, although two degrees further north.

After the cold morning of the 4th, my thermometer the five succeeding mornings stood as follows:

Jan. 5; zero. For a fortnight, commencing before the cold weather, and ending after it, the air was unusually still.

6, 14 below.

7, 19 do.

8, 12 do.

9, 1 do. The thermometer on this day, Jan. 9th, was 10 degrees above zero at 1 P. M.

My thermometer is at the north end of my house, facing directly to the north, and three feet from the ground.

During the last six years the thermometer has been lower two or three times in each winter, in still cold weather, in the valleys, than mine was at the same time. But the difference that has come to my knowledge, has never before this winter been more than thirteen degrees.

There has been but one colder morning here than that of the 4th of January for the last six years, and that was the 19th of January, 1853. The cold was then 26° below zero.

As to the cause of the unusual depression of the mercury in the valleys, which Mr. Breck seeks to learn, I do not profess to have much knowledge. However, I am willing to show you my opinion.

It is known that the air is generally heavier, and more dense in the valleys, than on the adjacent high lands, and it is therefore capable of containing more cold and frost.

As to the other branch of Mr. Breck's inquiry, "Whether, if there had been any wind the cold Sunday morning, there would have been any difference between the temperature of the hills and valleys?" This question I answer in the affirmative, without any hesitation. But the difference would have been the other way, if there had been much wind. It is a question that cannot be settled by theory, but it may be by facts. And the facts which I shall adduce will show that the cold, in a cold windy time, is greater on the high lands than in the valleys, by several degrees.

From observations I have made for several years past, I have found that my thermometer has stood in the morning in very cold windy weather, eight or ten degrees lower than those in the valley before alluded to. Indeed, whenever the thermometer is below the freezing point, and the wind strong, the cold is greater here than it is in the valleys. But the extent of the difference depends on the intensity of the cold, and the strength of the wind. And a greater difference in such cases than ten degrees has not come within my knowledge, and then the thermometer on the high lands was 20 and 22° below zero, and that in the valleys 10 and 12° below.

I think the cause of this difference is not so easily accounted for as in the other case. If it should be said, as I have often heard said, that the high wind blows the dense cold air to the high lands, how would the less dense and warmer air descend into the valleys to take its place? This would be against the laws of gravitation.

To be continued.]

## RAILWAY IRON.

95 tons of 1 inch by 1 inch.	Flat Bars in lengths of
200 do. 1 1/2 do. 1 1/2 do.	14 to 16 feet, counter sunk
40 do. 1 1/2 do. 1 1/2 do.	holes, end cut at an angle
800 do. 2 do. 2 do.	of 45 degrees, with appling
800 do. 2 1/2 do. 2 1/2 do.	plates and nails to suit.

300 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.  
Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, and 5 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

A. & G. RALSTON.

9 South Front street, Philadelphia.  
Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them.

d71mowr

## PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory, for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1831.

Spikes are kept for sale, at factory prices, by I. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. I. Brower, 223 Water street, New York; A. M. Jones, Philadelphia; T. Janverson, Baltimore; Degrand & Smith, Boston.

P. S.—Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes.

132-am

H. BURDEN.

## SURVEYING AND ENGINEERING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new, among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also a Railroad Goniometer, with two Telescopes;—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,

Mathematical Instrument Maker,  
No. 9 Dock st., Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

Baltimore, 1832.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad, I cheerfully furnish thee the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sight, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES P. STABLER, Sup't of Construction  
of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

Germantown, February, 1833.

For a year past I have used instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a theodolite with the common Level.

I consider these instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY B. CAMPBELL, Eng. Philad.  
Master and Norrist. Railroad

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, APRIL 4, 1835.

We tender our thanks to the Hon. C. F. MERRICK, for a copy of his Report on Roads and Canals, to Congress, in April, 1834.

Also, to Col. WETMORE, of the Assembly, and to JOHN B. JARVIS, HOLMES HUTCHINSON, and FREDERICK C. MILLS, Esqs., for copies of their Report relative to the cost of Canals and Railroads.

**NEW-YORK AND ERIE RAILROAD.**—The first feelings of indignation towards those who caused the rejection of the bill to aid and expedite the construction of the New-York and Erie Railroad, having subsided, the liberal mind naturally seeks for the cause why those citizens who have been so much benefited by the canal system, are so hostile to a project which promises so greatly to facilitate the business and intercourse of the State? Is it purely out of charity to their less enlightened neighbors, who have been so unfortunate as to "reside in those counties so largely infested by wolves?" Or is it for want of intelligence, and a just knowledge of the true merits of the question? Or rather, Pure selfishness—which induces them to believe that the route past their doors must of course be the most direct to market—even if it should be the farthest way round?

It is true that the favored many, who have been made so, and become so, by the liberal policy heretofore adopted by liberal men, and by them designed to be continued as the settled policy of the State, have mingled more with society, and may therefore be more courtly and polished in their manners; but we should doubt exceedingly

of their being more honest, or more deserving; and therefore we shall see whether they will vote their noble selves the necessary amount to complete those now constructing—to enlarge those now in use—or to commence new works?

The following paragraph from an Oswego paper does credit to the Editor.

"It is with feelings of mortification, disappointment and regret, that we announce the defeat of this bill in the Assembly, on Friday of last week. The vote stood 61 to 45! Who could have calculated upon such a result? Who, in view of the strong claims which the southern tier of counties have upon the State, and the acknowledged importance of the proposed road, who could have anticipated such a course, at the hands of a Legislature claiming to be honorable and high minded? No one. We do not hesitate to say, that their conduct has been illiberal and unjust in this matter, and dishonorable to them as legislators.

But we console ourselves with the conviction, that the matter is not going to rest here. This road must and will be built. The intelligent and enterprising citizens of the south western counties will never suffer themselves to be duped in this manner. They have RIGHTS, which they will be bold to assert, and we trust found able to MAINTAIN. If treated in this way, they will be driven to the ballot box for redress. There they can make themselves heard—and there they will be found. For our humble self, we would waive every political consideration, rather than submit to a system of persecution, so unjustifiable and so dishonorable. No man shall have our vote, whether for Governor, or a less responsible station, who has not foresight enough, and firmness enough, and independence enough, to come out boldly and independently in favor of this grand improvement."

**IMPORTANCE OF INTERNAL IMPROVEMENTS.**—Does any person desire a more convincing proof of the immense value of works of internal improvement, than the annexed paragraph?

The extent of the Coal trade prosecuted on the Schuylkill may be inferred from the fact stated in a paper presented to the Legislature of Pennsylvania in reference to the removal of the Seat of Government to Pottsville—"That the aggregate of all shipments to foreign countries from the seventeen Collection Districts, commencing with Amboy and ending with Wilmington, (N. C.)—which included all Jersey, Pennsylvania, Delaware, Maryland, District of Columbia, Virginia, and the chief ports of North Carolina,—barely exceeded the shipments of coal alone from Schuylkill county in 1833, ton for ton; and that if the trade of the Schuylkill had its station among the 'total value of exports' of the United States, her shipments of coal alone (including toll and freight

to Philadelphia) would amount to one eleventh of the whole."—[Baltimore American.]

If they do, they must be operated on by a wonderful degree of self-interest.

**AVERY'S ROTARY ENGINE.**—In our brief notice of this Engine in the last number of the Journal, we omitted to state a very important fact in relation to the construction of its boiler and chimney.

It has been deemed a very important matter, and great efforts have been made, to construct locomotives in such a manner as to avoid the danger arising from sparks from the chimney—with what success others have met, we cannot say; but in this respect Mr. Avery has been eminently successful—as when we were with it, in running near ten miles, not a particle of fire was discovered to issue from the chimney—and we are told that neither fire nor cinders ever annoy passengers, as they never come out of the chimney.

From farther experiments and investigation in relation to this engine, we are disposed to predict—although no pretensions are made to the gift of prophecy—that a Locomotive Engine will be constructed upon Avery's plan, within the next six months, which shall make a trip from Jersey City to Newark, and back again to the Ferry, in 45 minutes, with 100 passengers—passing the Bergen Hill, with an elevation of 155 feet to the mile.

**Chesapeake and Ohio Canal.**—The Uniontown Democrat has the following paragraph in relation to this important work:

"The Legislature of Maryland has appropriated two millions of dollars for the prosecution of the Chesapeake and Ohio Canal, which it is thought will secure its completion eighteen miles above Cumberland."

This will bring the termination of that great work within about ninety miles of Pittsburgh, and there is already a good road throughout the whole intervening distance. From the same point to Wheeling, the distance will not be less than one hundred and thirty miles.—[Pittsburgh Gazette]

**Remarks and Calculations on the best form for Railway Bars, and on the defects which exist in the present method of supporting the same.** By R. STEPHANSON, Engineer.

It is abundantly proved, both by experiment and mathematical demonstration, that when a beam is supported at both ends, and sustains a load, either uniformly distributed over the whole length, or placed at any point between the supports, it is of equal strength throughout, if the form be a semi-ellipse. In practice, this form is al-

most invariably adopted as the most economical, giving the greatest strength with the least quantity of material, especially in cast iron, which admits of the elliptical shape being accurately given to the beam. So long, therefore, as cast iron was employed for railway purposes, the elliptical rail was adopted by common consent. The circumstance, also, of this kind of rail, when carefully proportioned, scarcely ever breaking in precisely the same part of the length, proved experimentally that the form given to them was a close approximation to that of equal strength.

On the substitution of malleable for cast iron for railway bars, it was considered impracticable to give the elliptical shape to the rails; the first malleable iron rails were, consequently, made parallel, or uniform in depth, throughout the whole length between each bearing. This deviation from the elliptical form was deemed, by some engineers, a serious defect; so much so, that the extension of the use of the malleable iron for railway bars, was for some time retarded: this difficulty, however, was surmounted by an ingenious application of an eccentric roller, by which a form was produced, which, though it did not correspond accurately with the equation of the ellipse, yet approached it so nearly as scarcely to admit of any deviation being made with advantage.

Since the introduction of this form for malleable iron rails, some engineers have returned to the original parallel rail, conceiving that the application of the eccentric roller tends to destroy the uniform arrangement amongst the fibres of the iron, which in the parallel rail may be reasonably considered to extend uninterruptedly from end to end of the rail, which is, consequently, better prepared to withstand the kind of strain to which it is to be subjected.

Now far this anticipation is correct, is evidently more a matter of experiment than of calculation; it may, however, be interesting, in the first place, to compare the relative theoretical strengths of the elliptical and parallel rails, on the supposition that they are of the same weight for a given distance; and afterwards to compare the theoretical deduction with experiment, which will show the dependence to be placed on the application of the formula to cases where experiment is not within reach.

It is well ascertained that the transverse strength of beams varies directly as the breadth and square of the depth, and inversely as the length. It may be represented thus,  $\frac{b \cdot d^2}{l}$ ; when  $b$  = breadth,

$d$  = depth in the middle of the length, and  $l$  = length. In comparing the parallel and elliptical rails, the breadth and length may be taken as constant; the relative strength will therefore vary as  $d^2$ . Now, if  $d$  = depth of the elliptical rail in the middle, and  $x$  = the difference of depth between the middle and the ends, (or what is usually denominated "the belly of the rail,")  $d - \frac{1}{2}x$  will be, nearly, the depth of a parallel rail of equal weight; the relative strengths of the two rails will therefore be as  $d^2 : (d - \frac{1}{2}x)^2$ , or, 1 :  $\frac{(d - \frac{1}{2}x)^2}{d^2}$ .

The last fraction is clearly less than 1; consequently, the strength of the parallel rail must always be less than the elliptical, and will depend on the magnitude of  $x$ , or the swell of the rail.

In the view just taken, it will be observed that the projecting ledge on each side of the vertical rib, forming the surface of the rail,

has made no part of the consideration, because it is common to each kind of rail. It is not difficult to introduce it, but it would add to the intricacy of the formula, and would give a result a little more in favor of the elliptical rail, as it would elevate the neutral axis, and thus operate in favor of that rail which has the greatest depth.

The above formula applies merely to a vertical pressure; but as railway bars are also subject to severe lateral strains, it may be well to point out, in this respect, where the elliptical rail still has the advantage.

A lateral strain upon a railway bar is evidently nothing more than a vertical pressure, if the rail be supposed laid upon its side; the same formula then applies, making  $b$  and  $d$  change places; for what was the breadth in the former case, now becomes the depth, and as the depth and length are supposed the same, the relative strengths will be directly as the breadths; that is, as  $b : (b - \frac{1}{2}x)$ .

These results are, however, only applicable to the calculation of the ultimate strength; but in considering the relative advantages of railway bars, the ultimate strength of which ought, in all cases, far to exceed the working strain, it would appear that the quantity of deflexion, rather than the breaking load, ought to be the measure of their comparative merits.

It will be readily admitted, on a little consideration, that great, if not absolute, rigidity is extremely desirable in a railway bar; and, though it may be impossible to attain this object, we are justified in making every effort to approach it, by adopting that form of rail which possesses the greatest stiffness, with the least quantity of material. It is in this respect that the increased depth of the rail, obtained by making the longitudinal section a semi-ellipse, produces a very sensible advantage, and places the merits of the latter form in a much stronger light, than the comparison of the ultimate strengths.

The stiffness, or rigidity, of beams has been proved by Barlow, Young, Tredgold, and others, by a great variety of experiments, to vary directly as the breadth and cube of the depth, and inversely as the cube of the length. When, therefore, the lengths and breadths of the two beams are the same, the relative stiffness will be as the cube of the depth only. Now, the depths at the middle of an elliptical and parallel rail of the same weight, have already been stated to be as  $d : d - \frac{1}{2}x$ . The relative stiffness will therefore be as  $d^3 : (d - \frac{1}{2}x)^3$ , or as 1 :  $\frac{(d - \frac{1}{2}x)^3}{d^3}$ , a proportion much

more in favor of the elliptical rail, than that previously stated as representing the ultimate strength.

This ratio, it must be observed, requires modification, owing to the circumstance of a parallel beam being more rigid than an elliptical beam of the same depth in the centre; this deduction, however, is not such as to interfere in a great degree with the result indicated by the formula, as will be shown by the experiments adduced in the sequel of these remarks.

In determining the form of railway bars, little, if any, attention has been paid to the question of deflexion; it appears, therefore, the more necessary in this instance to consider its effects, as it is apprehended that it is productive of several injurious consequences, which have hitherto been attributed to a wrong cause. The usual method of uniting the rail chairs and blocks, by keys and pins, tends clearly to form the whole into an inflexible line, no one part

being capable of changing its position, without producing a corresponding change, or distortion, in the adjoining one. Immediately, therefore, on the slightest deflexion taking place in the rail between the supports, the position of the key which connects the rail and chair is disturbed, as it necessarily has a tendency to assume the same angular position as the rail. If this tendency is resisted by the grooved recess in the chair, for the reception of the key, the effect is merely to transfer the tendency from the key to the chair, which is thereby made to rest on one side, or aris, of its base, and on the other alternately. This continual transfer of strains from the rail to the key, from the key to the chair, and, finally, from the chair to the block, or sleeper—originating from the deflexion of the rail—never fails to destroy one or both of these connections; thus giving rise, not merely to perpetual expense in replacing keys, but to a continual jarring noise when carriages pass over them, from the looseness of the rail and key in the chair. Now, it being absolutely impossible to make the rail between each two supports perfectly inflexible, it seems only reasonable to conclude that every attempt to connect the parts, so that one portion of the structure partakes, in a greater or less degree, of the movements of the adjoining one, must be abortive. This is on the supposition that the inevitable deflexion in the rail is the only source of derangement; but when we add to this, the constant settling of the foundation upon which the blocks are placed, as well as the unequal yielding of the same, which destroys the parallelism between the surface of the rail and the bed of the block, the consequences just alluded to present themselves with increased force.

These reflections appear to countenance the conclusion that much advantage would be derived from the adoption of some method of connecting the rail and chair, which would admit of deflexion in the rail, as well as a change in the position of the block, without destroying the accuracy and efficiency of the connections.

A model of rail and chairs, contrived with the view of obviating the imperfections arising out of what may be termed the "inflexible" plan of connecting the rail and chair, accompanies these remarks. The method described by the model is not affirmed to be free from objection, but is suggested as much less objectionable than the method usually followed, and may be regarded as a step towards that perfection which, it is hoped, will, ere long, be attained in this very important part of the construction of a railway.

If the view here taken be correct, that is, if the deflexion of the rail is one of the principal causes of the present rapid working loose of the rails, keys, and chairs—which would continue to be the case, even after the road has obtained a firm and solid foundation—it is evident that, in order that the quantity of deflexion may be diminished, a stronger rail than has been hitherto employed, is desirable, independent of any consideration in reference to increased weights to be conveyed.

The next, and perhaps the most apparent cause of derangement in the accuracy of a railway, is the yielding of the material which supports the road; and as the practical operation of this shrinkage points to a comparison between the parallel and elliptical rail, it may be well to direct attention to it in an especial manner.

When a malleable iron railway bar is first laid and adjusted, each support throughout the five yards, (the ordinary length of each

rail, may be considered as duly performing its part. Immediately on any of the intermediate supports yielding, or falling below the general level, from the unsoundness, or from the consolidation of the ballasting, the block is forced, by the superincumbent weight, deeper into the ground; as soon as the weight has passed over, the elasticity of the iron (which is not destroyed) causes the surface of the rail to resume its original level; it cannot, however, do this, without lifting the block from the bed, or foundation, into which it was forced, during the progress of the weights along the rail. This effect is not perceptible, until the operation has been frequently repeated; but it is easy to perceive, that as long as the elasticity of the rail remains perfect, and the solidity of the foundations of the road imperfect, the operation of alternately forcing the block deeper into the ground, and suspending it by the elasticity of the rail, must, as a necessary consequence, be going on in every railway where long malleable iron rails are employed, with several supports under each rail. It is obvious that each block so lifted, (on weights being passed over the rail,) must be forced as by a violent blow upon the foundation, thus rapidly accelerating the sinking of the ballasting, and the destruction of the parts, when once allowed to become defective. Now, the tendency to the operation just described, can only be counteracted by increasing the weight of the blocks, and diminishing the elasticity of the rail at the point of bearing; it is, however, impracticable to adopt either of these expedients to an extent that would, in a material degree, approach to the removal of the effect, because any feasible increased weight of block is inappreciable, when compared with the elasticity of the rail. The effect is mentioned in this place, merely to prove that the reduction in strength at the point of support ought not to be looked upon as a defect in the elliptical rail; indeed, it may be made to appear that such a reduction is desirable, rather than the contrary: it will, therefore, be necessary to show that these observations respecting the suspension of the blocks, and the rapid succession of violent blows, like that of a ram, upon the ballast, are not merely ideal.

This is forcibly illustrated by a comparison of the expense of keeping malleable and cast iron railways in order, the latter scarcely exceeding one half the former, and in some cases (if report is to be received) rather less than that proportion.

It may, perhaps, be objected, that a comparison between cast and malleable iron, on different railways, is not a suitable criterion, as the traffic and speed may be so far different as to account for the difference of expense; this objection is, fortunately, not tenable, as applied to the Darlington Railway, because there the cast iron rails are placed on an embankment, over which the traffic and speed are the same as on other parts of the line. Here the comparison is decidedly in favor of the cast iron, and, as I have been informed, in about the proportion above stated; and, although I have not been able to obtain an exact detail of the expenses of each, the chairman of that railway company informed me, that after careful and minute examination, he had completely satisfied himself on the point, and as it corroborates my own observations, I am led to regard it as a well established fact. The only difference in construction between the two descriptions of rails, consists in the cast iron rail having a flexible joint above each support; when, therefore, the foundation sinks, the blocks sink with it; but, there being no re-action,

from the elasticity of the rail, the blocks never become suspended; consequently, the ram-like action is never called into play. This leads to the conclusion, that flexibility above the supports is not so weighty an objection to the elliptical rail as has been imagined.

It has been sometimes urged as an advantage in favor of the parallel rail, that the great strength above the supports enables it to sustain the load, even though the block may have sunk below the original level. If this be true, it appears to amount to little more than an admission that it is unnecessarily strong when supported by the blocks, which it in fact always is, because the deflexion of any railway bar of the ordinary strength, where the supports are six feet apart, would be so great as to render rapid velocities more destructive than they are; for the deflexion being directly as the cube of the length, would be eight times greater than where the rail is supported at every yard; moreover, the supports of a railway should never be allowed to assume that condition, in which one-half of the blocks are supposed to become useless. Preparing, therefore, by the adoption of parallel rails, for circumstances which it is not only practicable to avoid in a public line of road, but ought never to be allowed to take place, appears at least unnecessary; but when it is recollected, in addition to this, that the material thus expended in adding strength to the rail, above the supports, may be applied to other parts of the rail, where strength is more required, it certainly increases the inducement to follow the elliptical form.

The difficulty of manufacturing, and a proportionate increase of expense in, the elliptical rail, have, it is believed, been the principal causes of its rejection by some. To these I have endeavored to give the most impartial consideration; and with respect to the difficulty of manufacturing, if any really exist, I am convinced it arises from inexperience, as the operation consists, in addition to the rolling of ordinary bar iron, of merely once or twice passing it through the rollers by which the elliptical shape is given. That this should be considered a difficulty, creating an objectionable expense, is somewhat remarkable, since it occupies but a few seconds.

It is not improbable that the true source of this objection, (which arose originally, I believe, with some iron-masters,) is to be found in the fact that it is difficult, if not impracticable, to introduce into the elliptical shaped rail, iron of inferior quality, as the nature of the process almost invariably detects it. This is a recommendation so palpable, that an endeavor has been made to countervail it by stating that the process by means of the eccentric roller destroyed the continuity of the fibres, and injured the strength of the rail. Experiment, of course, is our best guide, and on referring to this test, it does not countenance the supposition that iron, of the best quality, is sensibly injured by the process of rolling into the elliptical form. An examination of the table hereafter referred to, will be a sufficient reply to this objection.

On a comparison of the chairs required for these two descriptions of rail, it will be found that they differ considerably in the depth of the recess for receiving the rail, that for the parallel rail being deeper, and the whole body of the chair higher, thus elevating the centre of gravity of the rail above the bearing surface at the bottom of the chair. Now, the chair for the elliptical rail is lower by a quantity equal to the swell of the rail, which of course brings the centre of gravity of the rail nearer to the bottom

Fish-bellied rail, equal to 40.6 lb. per yard.

	Permanent Deflection, 6.	Permanent Deflection, 4.	

On examining the table, it will be seen that the deflexions were measured at a short distance on each side of the centre, between the bearings. This arose from the circumstance of the weight being applied at the centre, which, of course, rendered it inconvenient to apply instruments at that point for measuring the quantity of deflexion.

Without noticing the results at each addition of weight, as detailed in the table, which is sufficiently explanatory in itself, it may answer our present purpose to take the results indicated when that weight, which will probably be the maximum in practice, was applied, say 62 cwt. With this weight, the bearings three feet apart, and each rail equal to very nearly 49 lbs., the deflexion of the elliptical rail is to the deflexion of the parallel rail as eighteen to thirty, nearly.

If the comparison of the other deflexions exhibited by the table be followed up, it will be found that they do not differ essentially from the above ratio.

If the weights producing permanent deflexion (or that point where the elasticity of the material is destroyed) be compared, it is scarcely less decisive; for we find that 174 cwt. produced a permanent deflexion of three in the parallel rail, whereas 230 cwt. did not reach this point with the elliptical rail.

Referring again to the table, there is only one other point to which I would beg particularly to direct attention, as it seems to corroborate what has previously been stated, respecting the impropriety of relying upon any ordinary railway bar for supporting the load, when the bearings are six feet apart. I allude to the deflexion which takes place with the weight of 62 cwt. placed on the parallel rail, when the distances between the bearings are increased to six, instead of three feet. Here we find, at 34 1/4 inches from one bearing, and 38 1/4 inches from the other, the deflexion amounted to 1 1/4 of an inch, which, in round numbers, may be taken at one-tenth of an inch at the middle point.

Now, it must be borne in mind that this result is with a weight perfectly stationary, and, consequently, unassisted, in any way, by percussion; whereas, a similar load, moving on a railway, oscillates upon the springs of the engines, or carriages, and would produce an effect greater than 1/10th of an inch, but permanent deflexion would take place at considerably less than 1/10th of an inch. We thus have it demonstrated how essential it is to preserve the blocks at a uniform level with malleable iron rails, otherwise the texture of the iron must soon

become permanently destroyed. It also proves how seldom we can take advantage of that which is said to be the chief advantage of the parallel rail, and that only when the railway is in improper order, in which case (as the experiments most distinctly prove) there will be great risk of permanent deflexion.

This brings me to notice an apparent advantage which the parallel rail has over the elliptical rail, but which has never, to my knowledge, been adduced, or much insisted upon. In the parallel rail, any weight, when above a block, or support, is divided more equally over three supports than in the elliptical rail, owing to the greater flexibility of the latter immediately over each block, or sleeper. This, it must be confessed, appears to be a striking advantage; but it must be compared with the fact, that in cast-iron rails, where the flexibility of the rail is reduced to nothing, and where each support in succession bears the superimposed load, without transferring any portion to the adjoining blocks, the expense of keeping the road in order is less than in malleable iron roads. Hence, it seems fair to conclude that the capability, in a rail, of transferring a portion of the strain to the adjoining blocks, is productive of injurious consequences, which are not adequately compensated for by this apparent advantage.

It is worthy of mention that this view of difficulties, or imperfections, arising out of having a number of bearings under one rail, is supported by a case in the construction of machinery, so nearly parallel, that it may be considered absolutely so, and fully appreciated by every practical mechanic. I allude to the difficulty and risk of placing more than two bearings under one axle-tree. It is found so difficult to keep such a construction in order, that it is scarcely ever adopted, and where the axle is long, it is generally divided into parts, making each bearing, and its portion of axle, independent. Now, this is precisely what is done in cast-iron railways; each support and rail has a duty to perform, which it does, independent of any other.

[To be continued.]

#### *The Alabama, Florida, and Georgia Railroad.* [For the American Railroad Journal.]

This is a work of great national importance, and a link in the chain of railroad communication which must in a few years be made between the Northern Atlantic cities and the Gulf of Mexico; and more especially, the great South-western Emporium, the city of New-Orleans. The route of this road is from the waters of Pensacola Bay, through Florida, to the dividing line between that Territory and the state of Alabama; and thence through the counties of Conecuh, Covington, Dale, Pike, Butler, Russell, and Barbour, in Alabama, to the Chattahoochee river, opposite the growing and important town of Columbus, Georgia, a distance of 190 miles, or thereabouts. The country through which the contemplated road will pass is well adapted for a work of that character, being almost a dead level the whole distance, with but very few inconsiderable water-courses to cross. This section of the country is said to be fertile and produces the great staple of the South in great luxuriance. It is anticipated that before the road is completed the amount of cotton raised in its vicinity will exceed 100,000 bales, and in five years the amount will not fall far short of 200,000 bales, all of which must necessarily find a market by the means of this road. In addition to this,

the supplies of goods for that whole section, which must be transported by this road, is estimated to amount in bulk to at least 150,000 bales of cotton annually. Another source of revenue to the road will be the direct travel between the North and South, now amounting by stage coaches to 25,000 persons annually, and which will increase in the same ratio the facilities of travelling are augmented. The great Southern mail will also find a speedy and direct transit to and from New-Orleans by the means of this road, with not only an immense saving in time but expense.

An examination of the topography of the country through which this road will run, will at once show its great utility, not only in times of profound peace, but in the hour of danger. The Alabama river on one side, the only channel through which the people of the up-country carry their produce to market and receive their supplies, is generally so low for at least six months in the year, that it is unnavigable for any thing else but flat boats and barges, always dangerous as well as dilatory conveyances, and in this period is generally included an important business portion of the year, viz. November and December, at which time the cotton is ready for market, but the planter cannot get it there to avail himself of the high prices with which the market most generally opens, and to receive his supplies of cotton bagging, salt, groceries, negro clothing, &c.: articles always essentially important, but especially at that juncture. The Chattahoochee is liable to the same objections as the Alabama, and similar difficulties exist with regard to its navigation. This road, commencing opposite the town of Columbus, the head of navigation on the Chattahoochee river, and running within a few miles of the Alabama river, will afford, at all seasons, the planter and merchant a *speedy, direct, certain and cheap* communication with the harbor of Pensacola, decidedly the best south of the Chesapeake: a harbor unrivalled in the South on account of its easy access; its capacity to admit ships of the greatest burthen, the salubrity of its climate, and its peculiar location, being the point from whence the whole commerce of the Gulf can be protected from piracy and foreign aggression. It is doubtless known that since the acquisition of Florida, the Government has considered Pensacola harbor the most important on the Gulf of Mexico—that it has established there a Navy Yard upon a large scale—that it is the rendezvous for the West India Squadron—that a large and impregnable fortification has just been finished, and another in progress, for its defence.

With regard to this project, we understand that in the month of December, 1833, a public meeting of the citizens of Pensacola was called, to take into consideration the practicability of the proposed road; that after mature reflection and great research, it was not only deemed feasible, but the examinations clearly demonstrated, that in a pecuniary point of view it promised to be a road yielding great profit. Application was made to the Alabama Legislature, then in session, for a charter, but in consequence of the short period before its adjournment, there was no definite action thereon. In November last a special agent was sent to the same Legislature, who succeeded in obtaining a favorable charter. The Florida Legislature at its recent session gave its assent to that charter, and authorised the continuance of the road from the Alabama line to the waters of Pensacola Bay, and at the same time amended the charter

of the Bank of Pensacola, (a bank now in high credit,) and increased its capital to \$2,500,000, with authority to subscribe for, or purchase at par value, the stock of the railroad. To enable the bank to make the purchase or subscription, it is authorised to issue bonds of \$1000, bearing an interest of 6 per cent., payable semi-annually, and redeemable after the year 1860, the payment of which (both principal and interest) is guaranteed by the Territory, and its faith pledged. We think the members of that Legislature have conferred a lasting benefit, not only on their immediate Territory, but the whole country, by their liberal course of policy in granting the amended charter of the bank with the guaranty and faith of the Territory, which is well guarded by the charter, and at once rendered secure. Measures have already been taken to effect a sale of the bonds, and we understand that there is not the least doubt entertained but that it will be effected at a premium; indeed, we cannot see how it can be otherwise, when the security offered is so satisfactory, and the work to be executed so important. It is contemplated that the work will be speedily commenced, and steps have already been taken to secure the services of the most distinguished engineers in the country.

A superficial view of the map convinces us that this is only the commencement of a series of works of similar character. This road must be connected with a road to the valley of the Tennessee river, a liberal charter for which has already been granted by the Alabama Legislature to the people of Montgomery. This work is consequent upon the one now about to be commenced, and we should not be deemed visionary, when we declare, as our solemn conviction, that Pensacola will, in five years, be what it was designed by nature, a town of the first commercial importance.

UNITED STATES NAVAL HOSPITAL, }  
near Pensacola, Feb. 18. }

DEAR SIR: I have had the honor to receive your letter of the 11th inst. in which my opinion is requested on certain points relative to the salubrity of Pensacola. It will afford me great pleasure at all times, to give you such information as I may possess, and in attempting on this occasion to comply with your wishes, I will begin by stating your questions:

"1st. Is there any natural cause in the situation of Pensacola to render it subject to bilious or yellow fever?"

"2d. What seem to be the causes of the visitation of bilious and yellow fevers to Pensacola about once in six or seven years, after intervals of perfect health? Can these causes be remedied, and how? and at what probable expense?"

"3d. Is, or is not, the climate of Pensacola especially beneficial to persons suffering from diseases of the chest—equally so with St. Augustine—and much more so than New Orleans, Mobile, or any Southern cities situated on rivers, or affected by fresh water air?"

The natural causes of bilious and yellow fevers in Pensacola are extremely few, situated as it is on an arid plain, remote from any fresh water river.

The chief element in the generation of diseases, is decayed vegetable matter. If animal matter be added, the cause will be more active, and the disease will be somewhat modified. Heat and moisture must be superadded to these. The scrubby oak, the dwarf pine, and the fine sand of Pensacola, proclaim their inadequacy to the production of vegetable matter, the essential ingredient, and indeed, the *sine qua non* of the cause of yellow fever. The stream which nearly encircles the city, it is true, gives life and vigor to a growth of shrubbery, but the shrubbery is evergreen, and its leaves only drop gradually and singly, (being continually renewed by other leaves,) and are instantly immersed in that lively little

stream which is ever gushing from its bed, or they find a screen from the rays of the sun in the thick shade that covers it. These springs of water are remarkable for their purity and softness: they commence nearly opposite the centre of the city, and running in different directions, form an estuary with the waters of the bay, one above, and the other below the city, about a mile from each other. It is to be observed, that the breadth of this springy ground varies from ten or fifteen, to one hundred, and even two hundred yards, and generally, though not throughout, it is a purely sandy bottom. There are some few spots only, in which rich mud is largely mixed with the sand.

This part of the subject will be left for the present, to be reverted to in the consideration of the second question. And here, I must dissent from the admission, that bilious and yellow fevers do visit Pensacola as often as once in six or seven years; as I do not find on record any account of these diseases reigning here previous to our times, except those given by Dr. Lind, which occurred in 1765. This author, however, only informs us that a mortal sickness prevailed in a regiment newly arrived from England. He does not mention that it affected the inhabitants, and states, that on board the ships in port every person enjoyed good health. Some of the old inhabitants of Pensacola, who are noted for accuracy of observation, inform me that they had the fever in 1811; these two, added to the visitations of 1822, '27 and '34, seem to constitute the sum of its history here, both written and traditional.

We have in possession certain facts, which lead with great readiness to the answer of the question, "What seem to be the causes of the visitations of the yellow fever to Pensacola?" And the most striking and important one is, that neither this disease nor any of its family has ever occurred here, except in consequence of the absence of rain in July and August. This circumstance is of exceedingly rare occurrence, so much so, that those months are proverbial for being prolific in copious showers accompanied with thunder and lightning. Yet it cannot be admitted, that dry weather alone at the period above mentioned, will with certainty bring yellow fever to Pensacola; for although the springs above described, become rather lower and leave some dead vegetable substances exposed to a high temperature, those of us who are familiar with their copiousness cannot conceive that there is ever sufficient pabulum supplied from this source alone to impregnate the atmosphere with deleterious effluvia. The nuisances of the city create other impurities in the air, which, united with the exhalations from the margins of the streams, form a poison sufficiently concentrated during unusually dry seasons to cause yellow fever. No one acquainted with Pensacola will deny that the back yards of a majority of the inhabited lots exhibit a fearful accumulation of "unclean things," which remain undisturbed equally by the police and by the occupant. From the proximity of the springs to the surface, the sinks are shallow, and are very liable to overflow and "scatter their odors to the winds." There can be but little doubt that the mass of rotten sea-weed which lay upon your strand all last summer, the stench of which is still strong in our recollection, should be added to the list of city nuisances. It will be readily suggested to any one how easily these substances may be removed, and their qualities neutralized. Fifteen years ago the city of Baltimore was visited annually with sporadic cases of yellow fever. They had their origin in local causes, which were pointed out by members of our profession, and removed by an enlightened police. Professor Potter, of the University of Maryland, has repeatedly said in his lectures that the time was not far distant when communities would be so well informed on the subject of the fevers in question, that it would be considered criminal in the authorities to allow them to occur in large cities. This prediction is now almost literally verified in his own city. This gentleman has treated the subject more ably than any other writer, in a little work "on Contagion," a work which will hand his name down with freshness to succeeding generations.

The following observations tend to prove that

without the superaddition of local causes found in the town itself to the malaria of the marshes, yellow fever would be unknown at Pensacola.

1st. Yellow fever never originates in the vicinity of Pensacola—not even on the very margin of the marshes, where the population is sparse.

2d It never originates among the shipping at the anchorage, directly opposite the town. The Falmouth ship of war furnished only two cases of it to the hospital last summer, and they were officers, who probably contracted it in town.—The schooner Grampus, it is true, suffered from the disease while lying in port, but she had all the materials for its causation, as it was proved, in the decayed and decomposed state of the plank of her ceiling. It appeared on board this vessel 15 days previous to the existence of any signs of it at Pensacola.

In confirmation of the opinion that the marsh effluvia alone of the place is not sufficient to produce the disease in question, it may be appropriate to add the following facts. The east and west villages of the Navy Yard are equally exposed, as it regards the bay and the small ponds in their rear. One of them fronts the bay on the east, having a series of small ponds west of it, the other fronts the bay on the south, and has the ponds to the north. The ponds in question were dry last summer, and their bottoms presented to view a thin layer of mud. The east village did not furnish a case of sickness last autumn; but in the south village eight or ten cases of yellow fever occurred within a few hours of each other, and two of them died. The south village had the disadvantage of a slaughter house situated immediately in its rear, which was exceedingly offensive. The Navy Yard, equally exposed with either village, to the effluvia of the ponds, remained perfectly healthy, with the exception of the case of one gentleman, who had a slight attack, traced to Pensacola. I was an observer here, in 1837, when no case originated at the Navy Yard, nor at either village.

It has been represented to me upon good authority, that the swamp or shrubbery of the springs of Pensacola was cleared up in 1811 and 1822. We all recollect that streets were opened through in 1827, and I think it was partially cut up again, the summer before last. These are certainly remarkable coincidences. It cannot be conceived that insalubrity would follow these clearings, provided the ground were put under cultivation, but clearing without cultivation has the effect to expose the surface to the rays of the sun and heat, and probably to produce an evolution of unhealthy effluvia which otherwise might have remained quiescent.

The causes of yellow fever, at Pensacola, therefore, are local, and are within the power of your police. They can be remedied with a little attention to cleanliness, and at a very trifling expense. The successful means, used by many cities in the United States, which were formerly visited almost annually, by this scourge of the human race, confirm our views of the nature of these causes, and inspire confidence in the efforts of man, for their removal.

For your third question, I have but little room left. Indeed, I could scarcely hope to do justice to the subject, in the space allotted to this communication, and as I propose to resume it on some future day, I will content myself, with stating it as my belief, that this is the finest climate upon the globe, for consumptive persons, and offer for your consideration, two facts, only. 1st, I have never known nor heard of a case of consumption originating here. 2d I have known several desperate cases, to be cured here, with very little medical treatment.

When Don Juan Ponce de Leon came in search of this country, he sought a spring, the waters of which were to rejuvenate man.

The fable, which gave spirit and animation to his enterprise like most others among nations had certain truths for its basis. The fountain of health, of not of youth, has a real existence here, and in the extent of benefits it is destined to dispense to the human family, the bright visions of the Spanish hero will be more than realized. I am respectfully, and truly yours,  
JAMES HUBBARD.

To Walter Gregory, Esq. Pensacola.

[From the Journal of the Franklin Institute.]

*American Patents issued in August, 1834.*

1. For a Cooking Stove; Horace Bartlett, Carmel, Putnam county, New-York, August 1. The claim in this patent is to the "extending the bed of the fire so far back that it receives long wood, in such a way that only about one half of it is burning at the same time, unless the draft door is opened at the back, which may be done when more heat is required; thus putting in long wood, and leaving it perfectly under the control of the manager, consuming no more than what is required for immediate use, thereby saving the expense of cutting the wood into short pieces; thus acting somewhat like the principle of burning coal from the base, but applied to wood for a cooking stove."

2. For an Improvement in the Apparatus for Tanning; James R. Deniston, Connersville, Fayette county, Indiana, August 1. In the petition, it is stated that the improved apparatus "consists of a vat protected from freezing in the bark house, in which is manufactured ooze of every desirable quality, from which it is strained off into a general reservoir, from whence it is dispersed, as required, throughout the yard, or raised to an elevated vat, and then dispersed, all by means of pipes, so placed under ground as to prevent freezing. The hides are hung perpendicularly in the vats of the yard. By means of this improvement there is a vast saving of labor and bark; at least twice the usual expedition; and excellence in tanning is secured, and no weather prevents the usual operations of the yard."

3. For a Washing Machine; Avery B. Gates, Connersville, Fayette county, Indiana, August 1.

4. For an Improvement in the Mode of constructing the Roofs of Buildings, and a Composition for covering all Kinds of Roofs, Brick or Stone Walls, Boards and Timber, exposed to the Weather; Daniel A. Balcom, Northampton, Bucks county, Pennsylvania, August 1. The compound resinous cement, here patented, is composed of eight parts tar, four parts rosin, and twelve or fourteen parts of finely pulverized dry clay, which are to be mixed together, and boiled until all the water has evaporated. Care must be taken that the ingredients be so proportioned, heated, and incorporated, that the mixture shall not be liable to melt and run by the action of solar heat, or to crack by its contraction from cold. The cement is to be laid on with a hot trowel, and all cracks and interstices must be carefully filled up. Among the purposes to which it is proposed to apply it, the coating of ships' bottoms, instead of copper sheathing, is mentioned.

5. For an Improvement in the Threshing Machine; John Marshall, Jr., Sweden, Monroe county, New-York, August 1. The so-called improvement is rather an appendage to the threshing machine, as it is intended to agitate and carry away the straw after it has been passed through the ordinary beaters. An

endless apron is to be made by taking two long ropes to form its sides or edges, and from one to the other of these ropes, slats, or wires, are to extend, parallel to and within an inch or two of each other. This apron is to be stretched upon, and to pass over, rollers, and upon it the straw is to be delivered as it is threshed. It is to be of such length as to carry the straw out of the barn, and during its passage a beater is to strike upon it to agitate the straw, and shake out the last portions of the grain. It is to be moved by the same power which gives motion to the threshing machine.

6. For a Truss for the Cure of Hernia; Thomas Lawrence, Clarke county, Kentucky, August 4. A pad is to be made of wood, which may be round, and from two to five inches in diameter. The side intended to be worn next the body is to be convex, and the opposite side flat; this pad, or block, is to be perforated through its centre, to admit a wooden pin to slide in it, which pin has a head of such size as shall pass into, and bear upon, the ruptured cavity.

7. For a New Manufacture of Figured Fabrics; John Smith, Shaeffers-town, Lebanon county, Pennsylvania, August 4.

"To all whom it may concern, be it known, that I, John Smith, of Shaeffers-town, Lebanon county, in the State of Pennsylvania, have invented a new manufacture of woven figured stuffs, such as carpeting, coverlids, table covers, and various other articles, either in single or mixed colors; and I do hereby declare that my said invention consists principally in the manner of preparing the chain to form the ground or basis of such articles, and that the following is a full and exact description thereof.

"I make the chain of the various articles which I manufacture, by taking two double and one single thread alternately; and in weaving the figures, the filling never floats over more than five threads; that is to say, over four double and one single thread, instead of over nine threads, as in the ordinary mode of weaving. The filling is also in part of single and in part of double thread, the single thread being employed to bind, or interweave with, the double thread of the chain; and the double thread of the filling, which is usually of woollen yarn, is bound by the single thread of the chain. By forming my patterns in this way, no part of the fabric is loose from, but is interlocked with, the pattern on the opposite side of the cloth, and a degree of firmness and distinctness of pattern is given, which cannot be attained by the use of a chain composed entirely either of double or of single threads, whilst, at the same time, each thread of the filling interweaving with one of the chain, at shorter intervals than in the ordinary mode of weaving, the article is rendered more durable, and the double thread of the filling being bound down by the single thread of the chain, the pattern formed by the double filling is left as distinct in its form and colors as in the more loose fabrics, in

which the filling floats or passes over a greater number of threads.

"All the variety of patterns given to goods of this description may be produced in my mode of weaving, and although I have made some improvements in the loom which I use for the purpose, similar articles may be woven in the ordinary figure loom; I do not, therefore, describe or claim any particular machinery for effecting the object in view, but claim only the arrangement of the double and single threads in the chain, and in the filling, applied in the manner and for the purpose herein described. Although I have spoken of double and single threads, both in the chain and filling, it is to be understood that these denominations respect the size of the threads employed, rather than the mere fact of their being double, or single, as a double yarn may be employed in lieu of that which I denominate single, provided its fineness was such as to produce the intended effect, and a fine double yarn thus used I should consider as interfering with my invention, as it would enable the weaver to produce a manufactured article essentially similar to that described."

8. For a Blacksmith's Striker; Joel Woodel, Jackson, Madison county, Tennessee, August 6.

9. For a Cast-iron Sink; Zenos Tarbon, Franklin, Delaware county, and Levi B. Tarbon, Oneonta, Otsego county, New-York, August 6. The description of this affair is so very brief that it would seem impossible to say any thing about it in fewer words than those used by the patentees, which are: "The sink is thirty inches in length, and twenty inches in width, with a soap dish in one corner, and a hole through the bottom to let off the water; all of which is made of pot-metal, and cast whole."

10. For improvements in the Construction of Bee Hives, and the Management of Bees; Levi H. Parish, Brighton, Monroe county, New-York, August 6. In the construction of the hives here recommended, there is nothing very peculiar; but they are to be large, and to be divided into separate compartments, by means of smaller boxes fitted into them, which boxes may be removed and replaced at proper periods. The main thing insisted upon is the advantage of keeping the hives within doors, in the upper rooms of a dwelling, or other suitable building. The benefits resulting from this are fully set forth, with much earnestness and good sense.

11. For an improvement in Weavers' Harness; J. Blackmar, Killingly, Windham county, Connecticut, August 7.

12. For an improvement in the Art of Manufacturing Nails; Freeman Palmer, Buffalo, Erie county, New-York. Patent first issued October 25th, 1832; surrendered and re-issued upon an amended specification, August 7.

13. For an improvement in the Construction of the Saw Mill; Thomas Blanchard, city of New-York, August 8. "The principle of this invention consists of the combination of a circular saw with

a common saw mill log carriage, of any convenient construction."

14. For an improvement in the Mode of Manufacturing Butt Hinges; Dorwin Ellis, Attleborough, Bristol county, Massachusetts, August 8. This patent is taken for the process by which the hinges are manufactured, there being confessedly nothing new in the machinery, which, in the present case, is merely adapted to the purpose to which it is applied. Strips of metal, about twelve inches long, and of a proper width, are to be cast with a projecting ridge along their whole length, which ridge forms the knuckle or joint of the hinge. The strips or plates, so cast, are to be passed between rollers, having grooves in them corresponding to the ridge in the strips; by this means they are equalized, and are then to be placed in a screw or other press, where they are cut off and the joints formed. The blanks or halves are next to be fixed in a drilling machine of the usual construction, after which they are ready for the pins.

15. For an improvement in the single twist Screw Auger; Nathaniel C. Sanford, Meriden, New-Haven county, Connecticut, August 8.

16. For an improvement in the spiral Screw Auger; Alfred Newton, Meriden, New-Haven county, Connecticut, August 8. This, instead of a two, is to be a three lipped auger.

17. For a Fire Engine; Thomas A. Chandler, Norfolk, St. Lawrence county, New-York, August 8.

18. For an improvement in Machinery for Dying and Printing; James Rennie, Lodi, Bergen county, New-Jersey, August 8. The specification informs us, that the invention here claimed is "an improvement and combination of machinery for dying, stamping, or printing, two or more different colors, mordents, or shades, at one impression, which improvement and combination I denominate the *magic sieve*." This is followed by a transcript of the whole of the specification of the patent obtained by the same gentleman on the 9th of June, 1834, and before noticed; and this is succeeded by a description of the magic sieve, which consists of an extension and variation of the same principle or combination that was the subject of the former patent.

19. For a Churn; Joshua Ricker, Bangor, Penobscot county, Maine, August 9.

20. For a Composition of Matter applicable to the Construction of Roads, Streets, &c.; John Martineau, Elbridge, Onondaga county, New-York, August 11. The claim at the close of the specification of this patent will exhibit clearly the object for which it is obtained.

"What I claim as my invention and improvement, is the application of tar, turpentine, or any other of that class of cohesive substances, reduced before use to a fluid state, and in that state used as a cement to apply to, and combine with, sand, gravel, pebbles, pulverized stone, such as is used for a Macadamized road,

or cobble stones; the interstices of coarse materials being in all cases filled, as well as may be, with sand and gravel, and cemented with tar, or turpentine, to form the wearing surface of roads, streets, &c., in the manner described in this specification, however the same may be modified or varied in practice. I also claim the application of the before mentioned cohesive substances, combined with sand, or other material, to the lining of canals, raceways, fooms, reservoirs, cisterns, &c. &c. in all the varied forms which practice may suggest, however modified or varied."

21. For Hulling Clover Seed; Benjamin Wood, Doylestown, Bucks county, Pennsylvania, August 11. The clover is fed on to a sloping sifter, by the shaking of which it is to be separated from the straw; this sifter has a tight bottom, and above this a false one, which is perforated with holes sufficiently large to admit the seed to pass through.

22. For a Heat Retaining Cooking Stove; John Moffit, Buffalo, Erie county, New-York, August 13. From what we can gather in the specification, the main object, in the view of the patentee, was to construct a stove, which should be surrounded by reflecting and non-conducting substances, forming an inner and outer case. For this purpose a wooden case is made, having its interior covered with sheet iron, which, however, is to be sustained at the distance of an inch and a quarter from the wood, the space between them being compactly filled with cotton. There must, of necessity, be a space of several inches between the case and the stove in all directions. To allow of a free play of heat within the case, the sides of the stove are, in part, constructed of vertical bars.

23. For a Fly Driver; R. H. Faunt Le Roy, New-Harmony, Posey county, Indiana, August 13. The fly driver is "intended to keep or scare away flies, moschetoes, and other insects, from beds, cradles, tables, and other places where said insects are troublesome, by means of fans, wings, brushes, curtains, or feathers, kept in motion by means of a machine, without the attention of any person."

24. For an improvement in Fire Proof Wrought Iron Chests, and in locks and fixtures therefor. First patented March 7th, 1826; patent surrendered and re-issued on an amended specification, August 13.

25. For a Press Tub, for pressing seeds, kernels, &c.; Francis Follett, Petersburg, Virginia, August 14. The principal improvement claimed in this patent is the mode in which the strainer is made that forms the bottom of the tub.

26. For a Cooking and Heating Stove; Samuel B. Sexton, Philadelphia, Aug. 14.

27. For an improvement in forming Bodies for Hats; William Nunns, city of New-York, August 14. Hair cloth, formed of horse, or other hair suitable for the purpose, and combined, if desired, with other filamentous substances, is to be formed into a body, and stiffened by any of the ordinary methods. The body so

formed is intended principally as a foundation for silk hats, but it may be used with other material, or by itself, which use the patentee would consider as a part of the present invention.

28. For a Horse Power; John A. Pitts, and Hiram A. Pitts, the former of Brinthrop, Kennebeck county, the latter of Livermore, Oxford county, Maine, August 15. The improvement in the horse power claimed by the patentees, they denominate an "Endless chain and cog band."

29. For a machine for Doubling, Twisting, and Laying, Spun Tobacco; James Maurey, Petersburg, Virginia, August 15. This machine resembles, in its general construction, some of those used for doubling and twisting cordage, but so altered as to adapt it to perform the same operation upon tobacco, and thus to facilitate, in an important degree, the manufacture of twist.

30. For an improved Oven; Richard R. Tonge, Fryeburg, Oxford county, Maine, August 15.

31. For a Machine for Hatchelling Hemp, Flax, and Wool; Daniel Treadwell, Boston, Massachusetts, August 18.

32. For machinery for Tarring Rope-yarns; Daniel Treadwell, Boston, Massachusetts, August 18. The patentee states that his improvement consists in three distinct parts. First, in the method of heating the tar; second, in rubbing, or untwisting, the yarn, for the purpose of saturating it with tar; and third, in the nippers for pressing out the superabundant tar.

33. For an improvement in the art of Extracting the Precious Metals from their Ores; John L. Sullivan, city of New-York, August 18. It is our intention to give a full description of the apparatus which forms the subject of this patent; but knowing that the patentee intends to introduce further improvements in the mode of procedure pointed out by him in his specification, we will at present merely observe, that by the machinery employed, the ores of gold, and more especially auriferous iron pyrites, are to be exposed, when pulverised, to the united influence of heat and motion; the heat being principally supplied by a current of air, which will carry off the sulphur and other volatile matters, and thus leave the gold in a proper state to be separated from the ore by amalgamation, either in the same, or in an auxiliary instrument.

34. For a Threshing Machine; Isaac Gallop, Plainfield, Windham county, Connecticut, August 18.

35. For an improvement in Fire Ladders; James Lee Hannah, M. D., city of New-York, August 19. A ladder is to be made in the usual way, but having the two sides parallel to each other. The topmost round is to be a bar of iron, which is to project through the cheeks of the ladder, and is to have a round roller, or wheel, at each end, which, by their rolling upon the wall, are to facilitate the raising of it. The main ladder may be forty feet in length; but there are to be

additional sections, each of from five to eight feet long, to be fastened on its bottom, when necessary; strong bolts at one end of these sectional pieces are to pass through staples at the lower end of the ladder.

(To be continued.)

### Engraving in Relief.

To the Editor of the Mechanics' Magazine:

SIR,—Every well-wisher to the cultivation of the fine arts must have been gratified at observing the progress that has been made during the last few months in this elegant department of engraving. To me it is a matter of surprise, that it should be brought forward now as a new invention, when the fact must be known to almost every one, that a specimen was inserted in the "Journal of the Franklin Institute" so long ago as September, 1832. On reference to page 206 of the first volume of the Mechanics' Magazine, the following account is given of its introduction, accompanied with an engraving and a particular description of the machine.

The Journal of the Franklin Institute, for September last, contains an elegant engraved portrait of William Congreve, the Dramatist, executed by Mr. A. Spencer, of Philadelphia, in the manner described, and has inserted the following proofs that the invention can be claimed for America.

"Believing that the credit of the invention of a machine for medal ruling is due to America, we will briefly set forth our proofs, and then speak of the improvements which of late years the method has undergone.

"The proofs to be given of the existence and state of a machine are to be derived from the results produced by it.

"In 1817, by the use of a machine which had been invented in Philadelphia, Christian Gobrecht, die-sinker, produced upon copper an engraving from a medal, having upon it the head of Alexander of Russia; from this engraving impressions were taken and distributed. One of these impressions we have seen.

"In 1819, Asa Spencer, (now of the firm of Draper, Underwood, & Co., bank note engravers,) took with him to London a machine of the kind above alluded to, which was designed principally for straight and waved line ruling. This machine was used in London during the year just mentioned, and the mode of ruling waved lines, and of copying medals, was then exhibited and explained by Mr. Spencer to several artists, particularly to Mr. Turrell, who took, by permission, a drawing of the machine, for the purpose of having one made for his own use.

"Little, however, was done in the way of medal ruling until about three years since, when a desire to apply the method to the engravings of designs for bank notes caused it to be revived by Mr. Spencer, who bestowed great attention upon it, and overcame the difficulties met with in the outset.

"The peculiar construction of this machine has never been made a secret, nor

has it ever been patented, although prudential motives have required that it should not be minutely described, and thus be placed in the hands of those by whom its use might be perverted. In consequence of this free communication in relation to this machine, it is now made with modifications in the details for engravers, by some of our machinists. We have lately had the pleasure of inspecting one of beautiful workmanship, made by Messrs. Tyler, Fletcher, & Co.

"The operations performed by this machine are the ruling of parallel straight lines at any required distances apart, and either continuous or broken; ruling converging straight lines; ruling waved lines, the waves being either similar or varying by more or less imperceptible gradations; and medal ruling, or transferring to copper the fac-simile of a medal, without injuring its surface, the waved lines presenting a copy of the minutest parts of the medal.

"Mr. Bate is said, in the extract which we have given, to be engaged in perfecting a machine for medal ruling: in his patent he claims the improvements on a machine for that purpose. It is impossible to say how far this latter claim may be borne out, since a description of the patented improvements has not yet reached us.

"That Mr. Spencer has essentially perfected this machine, as far as beauty of execution and fidelity of representation in the work to be done by it are concerned, we do not hesitate to say; and that the public here, and our brethren of England, may be enabled to judge for themselves, we have obtained from Mr. Spencer a specimen\* of medal ruling executed with his machine, an impression from which we give.

"The engraving is made from a copper medal placed in an embossed card of the ordinary kind. The surface of the medal bears not the slightest trace of injury from the machine, and even the yielding surface of the card is not roughened by it.

"An impression taken thus from a plate gives but a faint idea of the exquisite effect produced by engravings themselves made by this machine upon a polished surface of gold or silver.

"A series of the Napoleon medals, together with a portion of the series of medals struck in commemoration of the events of the first French revolution, attest the skill of Mr. Spencer."

It is with unfeigned surprise and regret, that I observe Mr. Ormsby, of this city, advertises himself as the inventor of the art. "Render unto Cæsar the things that are Cæsar's" is a rule the writer is always anxious to act up to, and he would be, indeed, glad to learn in what possible shape Mr. Ormsby can have any claim to be the inventor of the art. If he has any such claims, I have no doubt that your columns will be open for him to sub-

\* Various specimens of this work have been long since sent to London, and may be found in the possession of Messrs. Perkins and Heath, and of other artists.

stantiate them; if not, he and all others who assume to themselves merit where none is due, should be made to feel, experimentally, that the real inventors may, with some justice, apply the language of the immortal bard to them, when he says,

"He that filches from me my good name,  
Robs me of that which not enriches him,  
But makes me poor indeed."

J. K.

New-York, March 16, 1835.

The Philadelphia Gazette of Tuesday says that about half the stock in the Lancaster and Harrisburg Rail Road was sold yesterday, when the books were closed. They will be re-opened this day, at 10 o'clock, for a short time, to receive the number required. We subjoin a calculation based upon the actual receipts on the Columbia road, of which this is a continuation. Our capitalists should not suffer the opportunity to escape them.

The following calculation, based upon data which cannot mislead, is submitted to those disposed to engage in this important work.

The amount of Tolls collected on the Philadelphia and Columbia rail road during the last five weeks has averaged per week more than 3000 dollars.

Taking the average of 3000 dollars, they will amount per annum to 156,000 dollars.

At the same rate, the tolls on the Harrisburg, Portsmouth and Lancaster rail road, which is 39 miles long, the former being 82, will amount to 72,975 dollars 73 cents.

The cost of that portion of the Road between Portsmouth and Lancaster is estimated by Moncure Robinson, Esq. at from 13 to 15 thousand dollars per mile; taking the average of 14 thousand, 29 miles is

Estimated cost from Portsmouth to Harrisburg. 60,000

Estimated cost of long Tunnel, in case it should be determined on, from 60 to 70 thousand dollars; taking average of

Estimated cost of the whole work, \$551,000

On which 72,975 dollars is upwards of thirteen and a half per cent.

Thus it is that our neighbors who learned a useful lesson, from the early success of N. York enterprise, the spirit of which, unfortunately, no longer pervades our councils, are enjoying the benefits of their works of internal improvement in use, and with a spirit which does them great credit, are pushing forward other works, which will eventually, unless met promptly by our citizens, divert a large share of the business, which might easily be secured to our city and state.

The citizens of New York will not, I am sure, permit this diversion without a struggle to retain it.

[Extract of a letter dated Harrisburg March 26.]

The following is a synopsis of the general improvement, as reported in committee of the whole:—"The first section appropriates to the Philadelphia and Columbia Railway, 110,600 dollars. To the Allegheny Portage Railway, 146,600. To the Lycoming Line of the West Branch Division, and the Lewisburg and Bald Eagle side cuts, 47,000 dollars. For the Wyoming Line of the North Branch, 40,500 dollars.—To pay contracts for new work upon finished lines, and for the payment of the Canal Commissioners, their Secretary, Office expenses, &c. 125,000 dollars. For repairs, 200,000 dollars.—For damages, 30,000. In all 699,700 dollars.

The 2d Section appropriates towards new works, as follows: Towards the construction of ten miles of canal between the head of the towing path above New Castle and Sharon, in Mercer county, 100,000 dollars. Towards constructing

30 miles of Canal, beginning at the north western termination of the French creek feeder, towards Lake Erie, 200,000 dollars. Towards constructing a railway from Noristown to Allentown, along the valley of the Schuylkill and Perkioming, 75,000 dollars. Towards constructing a towing path along the feeder dam at Dunstown, and to continue the slack water navigation up the West Branch of the Susquehanna, 100,000 dollars. Towards continuing the North Branch Canal, not exceeding 20 miles, towards New York State line, 100,000 dollars. Towards the construction of 15 miles of railway from Columbia towards Chambersburgh, via York and Gettysburg, 75,000 dollars. Towards the construction of a navigable feeder from some point on the Allegheny river, to the aqueduct near the mouth of the Kiskiminitas, 100,000 dollars. For the relief of the Chambersburg and Bedford, Bedford and Stoytown, Stoytown and Greensburg—the Somerset and Mount Pleasant—the Williamsport and Washington—and the Washington and Pittsburgh turnpike road companies, 80,000. And to the Somerset and Cumberland turnpike, 5000 dollars. In all 835,000.

The third Section appropriates 8,000 for the survey of a route for a Canal, slack water and railway from Dunstown through Clearfield, Jefferson and Armstrong counties, to Franklin, in Venango county; and from the Sinnemahoning creek to Clarion River.

The 4th Section appropriates 6000 dollars to the turnpike road from Johnston to Ligonier; and 10,000 dollars towards opening a State road from Tamaqua, in Schuylkill county, to Mifflinburg, in Columbia county. In all 24,000 dollars. Total amount of appropriations, one million five hundred and fifty-eight thousand seven hundred dollars."

**CANALS IN USE vs. CANALS IN ICE.**—Whilst the New York Canals are yet ice-bound, those of Pennsylvania are yielding a rich harvest, as will be learned from the following statement:

Amount of tolls received at the Collector's Office, Columbia, for the week ending March 21st, 1835, \$1355.93.

The following extract from the Elmira (Tioga Co.) Republican of the 28th ult., showing the advantage Pennsylvania enjoys over New York in early navigation, says:

Two packet boats from the Erie Canal arrived in this village last fall with their owner, his family, and workmen, on their way to the Pennsylvania Canals. The smallest passed on, with the family, household furniture, and tools for building boats, which was the object of the journey, and arrived in safety; the other followed yesterday. Taken altogether it is a novel circumstance, as it is an unfrequented route for such craft, and as the boats answered the double purpose of freight boats and a habitation by winter as well as summer. The steamboat has commenced running on Seneca Lake.

There is now a fine rise in the Chemung, and our merchants are sending off arks laden with salt, plaster, shingles, &c.

The Chemung Canal connects with the Chemung river at Elmira, and of course opens a communication with rivers and canals of Pennsylvania.

The Trenton Gazette states that the Delaware and Raritan Canal is now in full operation for vessels drawing six feet water. Several vessels have passed from Philadelphia to New York. It is said that arrangements have been made for a heavy business the ensuing season. The Company have placed a large number of horses on the line, in order to furnish vessels with relays at short intervals; and thus expediate their passage.

**Quick Work.**—An individual left this city at 9 o'clock P. M. on Wednesday for South Amboy, where he chartered a locomotive and proceeded to Philadelphia, arrived there at 9 P. M. He transacted his business there, and immediately returned by the same route, and reached New York again early yesterday morning!—[Gazette of Friday.]

**NEW YORK AND ERIE RAILROAD.**—The final vote on this bill to aid and expedite the construction of this road, of 46 to 61, should not be taken, as it was not considered, as the test of strength of the friends of the road. The real and true test was on the amendment of Mr. H. SIBLEY, which was as follows:

Mr. M. H. SIBLEY offered an amendment, without which he declared that he could not vote for the bill. It provided that certificates of stock should be issued, to the amount of \$500,000, upon the completion by the company of a Railroad from the Delaware and Hudson Canal to Binghamton—to the amount of stock upon the completion of the road to Elmira—to the same amount upon the completion of the road to the village of Olean—and to the same amount on the completion of the road to Lake Erie.

After considerable debate, the question was taken on this amendment, and lost—53 ayes, and 55 noes; upon this decision, some of the best friends of the road left Albany, because it had been, and was, considered the defeat of the bill; and others voted with the majority, for the purpose of being enabled to move a reconsideration. There is no doubt but that there was a majority of the members in favor of the bill; and had they all been present when the vote was taken on the amendment, it would have been carried, and the bill would have passed, at least in the Assembly. M.

**Remarkable.**—When the properties of steam and its power were first ascertained, it was supposed human genius could extend no further; still, since then we have had our streets and houses lighted by gas, and now we are to have our residences warmed and our provisions dressed without the use of "fire, flame, smoke, steam, gas, oil, spirit, chemical preparation, or any dangerous substance whatsoever." Incredible as this may appear, it is no less true, an ingenious German having invented a machine by which it may be accomplished. It is made of brass, is about 22 inches high, 12 inches wide, and 6 deep, has the appearance of a miniature chest of drawers, and is surmounted by an inverted crescent, which is hollow for the purpose of containing water. It is called "Wenn's Solar Stove," and is heated by "elementary heat," produced (according to the words of the inventor) by "separate and combined elements." It may be used with great safety in ships, and in manufactories and warehouses, where in consequence of the combustible nature of the stock, fires are prohibited. The process of heating is so clean and simple that a lady having white gloves on, may perform it without spoiling them, or a child three years without injury.

Yesterday its powers were exhibited at the West India docks, before Captain Parish the dock master; T. Sheldrake, Esq engineer, Beck, Esq. and a number of other gentlemen connected with the dock company, and who expressed the greatest astonishment at Mr. Wenn's invaluable discovery, and said they considered it would be of incalculable service to the navy, &c. Heat was produced by invisible means in less than two minutes, and in three minutes afterwards, water, which had been put in cold in the crescent, boiled with such force that the window of the room in which it was tried was compelled to be opened to let the steam escape. There is a drawer in the machine in which a steak or chop can be cooked in its own gravy, but there not being one at hand the experiment was not tried. Three hours after it had been heated, from which time nothing had been done to it, it was found to be still so hot that it could scarcely be touched with the naked hand, although it had been carried from the docks to the city.—We understand it is the intention of the ingenious inventor, who has expended all he was possessed of in bringing it to perfection, to exhibit it to the public at the museum of arts and sciences, in Leicester square.—[London Morning Chronicle.]

**To a Solitary Old Oak in the West.**

Thou art a monument of buried years—  
Who's he, can look upon thy hoary trunk,  
And think not on the scenes by thee beheld?  
Now as the unseen wind shakes thy broad leaves,  
Methinks there is a voice, that speaks of days,  
When by thy side, stood many such as thou,  
And 'neath their broad arms, the swift footed deer  
Fled at the red man's steps—and thou hast seen  
The arrow pierce his side—drink his warm blood,  
And stretch him on the withered leaves to die.  
Here has the council met, the Warriors here  
And old men of the Tribe—and thou hast listen'd  
To the stern eloquence of untam'd minds,  
Hast seen the bloody token of revenge  
Torn from its grave, hast heard the warwhoop wild  
And the fierce din and clash of hard fought battles;  
And the red drops of some proud heart, have stain'd  
The yellow leaves, which many ages past,  
Have fallen from thy boughs, and now those men,  
Whose histories are only known to thee,  
Are buried near thee, and thy wide-spreading roots,  
Extending through their graves, encircle bones  
Of Kings, and wreaths the brows of Warriors.  
W. B.

**SILK MANUFACTURE.**—Mr. Gay, of Poughkeepsie, has arrived in this city, with the intention of establishing a Silk Manufactory here, on a permanent basis. He has, by close observation, much experience and uncommon talent, succeeded in stripping the manufacture of Silk of all mystery and difficulties. He has reduced it to a simple and certain business, capable of producing regular returns, and discovers the best evidence of the fact by his determination to carry on the manufacture himself in several different places. Those desirous of seeing the beautiful fabrics in his possession, and the plans by which they are produced, will find it to their advantage to call on Mr. Blydenburgh, at the Agricultural and Mechanical Repository, 96 North Pearl st., Albany, where further particulars may be learned.

**New Arrangement of the London Packet Line.**—By referring to our advertising columns, it will be seen that the Proprietors of the London Packets have been increasing the number of them by adding several new ships to the Line. Hereafter, a packet will be dispatched every ten days. We understand that the new ships are of the largest class, and are fitting up in the most attractive style; thus furnishing to the numerous passengers that patronize the Packets, new inducements to visit Europe. Our Packets already vie with those of any part of the world—and all improvements deserve commendation. We cordially offer them our best wishes.—[Commercial.]

**Florida Land Claims.**—On the 16th inst. the Supreme Court of the United States pronounced a decree in favor of the claimants, in the case of "Colin Mitchell and others, vs. the United States." This settles (says the Savannah Georgian) in favor of the proprietors the right to the large tract of land in Middle Florida, called Forbes' Purchase, the title to which was derived from the Aboriginal Indians, with the consent and concurrence of the Spanish Government, but which has hitherto been kept in suspense and litigation since the cession of Florida to the United States. This tract of land comprehends about 75 miles of the coast of the Gulf of Mexico, from Cape St. Blas to the Bay of Appalachicola, and ranges into the interior about 40 miles to the vicinity of Tallahassee, and is estimated to contain about a million and a quarter of acres. Being watered by the river Appalachicola at the West, the St. Mark's at the East, and the Ocklockny in the middle, this tract embraces a variety of soil; and we are informed that it is the intention of the proprietors to bring it into market at as early a period as practicable.

## NEW-YORK AMERICAN.

MARCH 28—APRIL 3, 1833.

## LITERARY NOTICES.

A STATISTICAL VIEW OF THE UNITED STATES, including also an account of the Banks, Manufactures, Internal Improvements, &c. &c., together with the Revenues and Expenditures of the General Government, by TIMOTHY PITKIN: 1 vol. New Haven, DURRIS & PECK.

It is eighteen years, since Mr. Pitkin, then a member of Congress, from Connecticut, published the first edition, of this most useful and accurate work. Since that period, the population of the United States has nearly doubled; our internal resources have been wonderfully developed, and our commerce, modified by the universal state of peace, has found new and varied channels.

It was, therefore, well imagined by Mr. Pitkin, to republish a new, and more enlarged edition, of this work, brought down to the last year.

There is no subject connected with statistics, properly so called; embracing details respecting the population, commerce, wealth, industry, resources, and occupations of the United States, on which this book does not give full, late, and accurate information—wherever accuracy was obtainable by consulting either public documents, or the most authentic private sources.

THE HISTORY OF THE HOLY CATHOLIC INQUISITION, compiled from various authors, with an introduction, by the Rev. Cyrus Mason, Pastor of the Cedar Street Church, New York. 1 vol.—Philadelphia: H. Perkins; for sale by D. Appleton, New York.—The immediate motive for presenting at this time to the youth of America, a popular history of the Inquisition, is stated to be the fact, that those United States are now the favorite ground of Propagandism, selected by his Holiness the Pope, who has recently appointed "an ecclesiastical ambassador, a legate with plenary power, to manage the cause of Romanism in the new world." Hence it is desired, that Americans should understand what the aims of Catholicism have been, and what it is assumed they may, when the power exists, again be.—This compilation is derived from authentic materials, and is made by one whom the Rev. Mr. Mason vouches for, as a person who has enjoyed the best "opportunities for making a fair estimate of the institution described in his glowing and patriotic pages;" and who writes under the conviction, that "liberty and happiness could never be the portion of the people, who had yielded themselves to the influence of Romanism."

This question of religion is, like every other in this country, to be determined by the people for themselves—they are free to choose or to reject. In order that such decision may be intelligent, this, among other works, is published. The truth must result from knowledge, but in order to insure such an issue, the truth should be told.

Whatever the Inquisition may in other days have been, it has of late years, been rather a political, than a religious institution. But even as a religious institution, it is, we think, forcibly, and justly argued, by the National Gazette, in some comments on this book, that "the Roman Catholics of the United States are not more responsible for its abominations, now centuries old, than the Protestants are for the executions in the reign of Queen Elizabeth, the Calvinists for the atrocities at Geneva, or the present generation of Yankees for the burning of the witches at Sa-

lem, and the proscriptive intolerance of their pilgrim fathers. To publish now histories of the excesses of the several branches of Protestantism, with illustrative engravings, would not be more unjust and uncharitable against them, than the publication of this volume is, with reference to those whom and whose worship it is designed to injure. Mutual forbearance is important for the common cause of Christianity. It was a wise man and good Christian who said—"Nothing has driven more people into the harlot lap of infidelity and indifference than the mutual hatred of Christian Congregations. It is dreadful to revive the dissensions and animosities, which have slept for a century; but if we must be driven, whether we will or not, to recollect those unhappy transactions, let our memory be complete and equitable—let us not forget the provocations, the outrages and persecutions, on every side, and if we do not then piously hate and annoy each other more, we may make some reciprocal allowances, and the result may be favorable to common good will. As long as men hold charity and justice to be essential parts of religion there can be little danger from a strong attachment to particular tenets of faith."

While, therefore, we entertain the opinion that Catholicism—if not absolutely incompatible with—is little favorable to, civil liberty, and the progress of popular education, we would not seek to oppose it, by any other, than open, free, and unprejudiced discussion.

SIX MONTHS IN A CONVENT, or the Narrative of Rebecca Theresa Reed, an inmate of the Ursuline Convent at Charlestown, Mass.: 1 vol.: Boston, RUSSELL, ODIERNE & METCALF; N. York, LEAVITT, LORD & Co.—Our readers have already heard so much of this little volume, that we shall be excused for passing it over without any long notice. It is ushered to the world by "a Committee of Publication," who, however, avouch its identity, as to facts and thoughts, though altered somewhat in language, with the original MS., written soon after the author escaped from the Convent. This was in February, 1832, nearly two years and a half before the Convent was burnt. For nearly a year previous to that event, the MS. had been in the sole keeping of the Rev. Mr. Croswell, of the Episcopal Church. The main object of the publication seems to be, to deter Protestant parents from sending their children for education to a Catholic Seminary.

Our only marvel, on this head is, we confess, that any warning, or argument, should be necessary.

ELEMENTS OF GEOMETRY, containing the first six Books of Euclid, &c., by JOHN PLAYFAIR, F. R. S. London, &c.; a new edition, entirely remodelled, by JAS. RYAN, author of an elementary treatise on Algebra, &c.; 1 vol.: N. York, W. E. DEAN.—This is a standard book, and has long been. It has received from Mr. Ryan, a skillful mathematician, some amendments, elucidations and additions, which, it is thought, will render it a more useful book to American learners.

THE AMERICAN JOURNAL OF SCIENCE AND ARTS—No. I. Vol. XXVIII. Benjamin Silliman, M.D. LL.D. &c. New Haven: H. Howe & Co. New York: G. & C. Carvill.—It is with real concern, and not without a sense of shame for a people who insist upon being considered "the most enlightened" under the sun, that we find it stated in this number of the Journal, that unless reinvigorated by new subscribers, it,—the only scientific Journal which has had any prolonged existence in the United States,—must die of inanition! Shall it be said, that because there is in

it no politics,—no scandal,—no appeals to passion or prejudice,—to the frivolous interests of fashion,—to the fleeting excitements of the hour,—one able, calm, methodical repository for the recording, and discussion of, important facts, principles, practical results, and theories, in science, cannot live? We hope not,—we believe not. Let each man who either feels an interest in such subjects, or in the reputation of the country, more or less connected as it is with such a work, undertake to procure a single subscriber, and the work is done; and in no other way can it be done with any hope of permanent benefit.

NO FICTION—a narrative founded on fact, by the Rev. ANDREW REED, D. D., 1 vol., N. Y.: HARPER & BROTHERS.—We had occasion within a short period to speak of *Martha*, by the same author, whose previous work—not of fiction, but yet with the interest of romance—is now presented to the public. The history of Lefevre, of his temptations, struggles, doubts, triumphs, is fraught with deep attraction and instruction—and wrought out with equal truth and skill.

DISCIPLINE, a novel by MARY BRUNTON, author of *Self-Control*; 2 vol., Phila., KEY & BIDDLE.—Though less decidedly a religious novel, or tale, than that noticed immediately before it; this—as most of our readers by the way, we dare say know, for it is not a new work, though it is a new edition—is a book which inculcates in a very pleasing way, that moral which lies at the bottom of all excellence, and which if it stood alone in the sacred volume, would attest the divine origin thereof—"do as you would be done by."

THE LIFE OF AARON BURR, by SAM'L. L. KNAPP; 1 vol.: N. York, WILEY & LONG.—We are disappointed in this book. It is inelegant in style, meagre in facts, and excessive in admiration of its subject.

The early services of Aaron Burr in the war of the revolution, and especially his share in the hazardous, daring, and most trying march of Arnold's command, through the wilderness to Quebec, in 1775, connected his name so favorably with the cause of Free America, that nothing short of notorious misconduct on his part, could have divorced him so effectually as he is divorced, from the sympathies, the respect, and confidence of his countrymen. There is an entire want of discrimination, therefore, as it seems to us, in the generally eulogistic, and always excusatory, strain in which this notice of his life is written; for it fails entirely to account in any satisfactory manner, for the desertion of Burr, by all men of all parties.

With great defects as a biography, or as affording materials for authentic history, there are nevertheless many interesting facts and documents brought together in these pages in a small compass. Among the most curious of the latter, is an original journal, kept by Arnold of his march from the Kennebec. There are also, in the Appendix, though not now published for the first time, some important papers connected with the contested election between Jefferson and Burr in 1801.

We have little room for extracts—but must advert to the following statement, which is at variance entirely with all that has been hitherto related of Mrs. Arnold's innocence of any participation in her husband's treason; and, if true, shows her to have been an accomplished actress.

Colonel Burr, in 1780, was on a visit to Mrs. Provost, the lady who not long after became his wife, when Mrs. Arnold stopped at her house, on the way to the city of New York, in order to join her husband. At the first news of his treason, Mrs. Arnold excited the sympathy of every one. Her lamentations and screams might be heard at a distance, and many feared that her reason would be shaken from its throne. Several of the officers at West Point at that time, wrote most affecting descriptions of her wretchedness; and some went so far as to think that the wounds given to the heart of an elegant and an accomplished woman, deserved as much punishment as the treason Arnold had committed. Washington was deeply affected by her situation, and rendered her every assistance in his power, and with great gallantry sent her a letter of safe-conduct to the lines. Mrs. Provost was the widow of a British officer, and to her Mrs. Arnold could confide herself; and being assured that no one was near but those of strict honour, she threw off the mask, thanked God that the face of hypocrisy was over, for she hated to be an actress any longer. She said that she had commenced the correspondence with the British commander, and had brought her husband to the deed at last, stating, also, that she had long abhorred the American cause, and now was happy that she was free from the rebels. This spoils the pathos of many brilliant descriptions of her patriotism and sensibility; but, nevertheless, the generous feeling in which they were written will still remain as proofs that there was nothing revengeful or low in the dispositions of those who achieved our independence.

THE DUKE DE LA ROCHEFOUCAULT'S MAXIMS, &c., with a biographical preface and an appendix by the Editor: New York, G. & C. CARVILL & Co.—This should be a welcome book; for it is one of established fame, in all languages—and almost out of print, we were going to say, in our own. The translation is not new, though in some instances revised. The short biographical memoirs, prefixed by the present editor, does justice to the character and abilities of *La Rochefoucault*. The appendix contains some maxims by the editor, modelled on those of his author; but not always happily.

PRACTICAL EDUCATION; by MARIA EDGEWORTH and RICH'D LOVELL EDGEWORTH, 1 vol. N. Y.—HARRIS & BROTHERS.—No parent should fail to read this admirable treatise, of which we have here a new, handsome, and compact edition; as none—however they may have studied the various theories of education, or been practical observers of the growth of the mind from infancy to childhood—can read it without profit.

CLOSE OBSERVATION, and eminently practical good sense, are exhibited in every page of the work—of which, moreover, the character has long been too universally established to need any commendation, at this time of day, from our pen.

CANVASSING. A tale—BY THE O'HARA FAMILY; 1 vol.; Phila., CAREY, LEA & BLANCHARD.—This is a tale of higher life and less fierce passions than the last which preceded it from the same pen, the *Mayor of Wind-Gap*, but not therefore of less general interest.

A CATECHISM OF PHRENOLOGY, illustrative of the principles of that science. Phila., CAREY, LEA & BLANCHARD.—An elementary work, of which the best recommendation, we presume, is to say—especially for one uninitiated in and without sceptical as to, that science?—that it has gone through six editions in Glasgow.

AUTOBIOGRAPHY OF JACK KETCH, with Illustrations by Meadows; 1 vol.; Phila., CAREY, LEA & BLANCHARD.—This is a moral book—though its title would hardly seem to imply such charac-

ter; and though we think the unquestionable talent displayed in it might have framed a more agreeable mode of making itself felt, we take the good as we find it.

THE HUDSON RIVER GUIDE. N. Y.; J. D. TURNELL.—This neat little pocket book gives for 50 cents, a good engraving of the Battery and Castle Garden, a colored map, neatly folded up of the course of the Hudson, with its shore and prominent points laid down accurately—and several pages of letter press, describing the landings, the principal places, the stage and coach routes, &c. &c.

THE ENVIRONS OF QUEBEC, by A. HAWKINS—is a neat and well executed little map, giving an account, view and enumeration of the remarkable places, and recent settlements, around Quebec.

The Mirror of this week is embellished with a beautiful engraving, by *Smillie*, from a painting by *Weir*. We copy the beautiful lines of *Bryant*, published long years ago in this paper, to which the engraving is so happily adapted, and the description, by *G. C. Verplanck*, of the lake and scene embodied in it.

The whole number of the Mirror is good.

#### AN AUTUMNAL EVENING.

"Whither, midst falling dew,  
While glow the heavens with the last steps of day  
Far, through their rosy depths, dost thou pursue  
Thy solitary way?"

"Vainly the Fowler's eye  
Might mark thy distant flight to do thee wrong,  
As, darkly painted on the crimson sky,  
Thy figure floats along."

"Seek'st thou the plashy brink  
Of weedy lake, or margin of river wide,  
Or where the rocking billows rise and sink  
On the chafed ocean side?"

"There is a Power whose care  
Teaches thy way along that pathless coast—  
The desert and illimitable air—  
Lone, wandering, but not lost."

"All day thy wings have fanned,  
At that far height, the cold thin atmosphere,  
Yet stoop not, weary, to the welcome land,  
Though the dark night is near."

"And soon that toil shall end,  
Soon shalt thou find a summer home, and rest,  
And scream among thy fellows; reeds shall bend,  
Soon, o'er thy shelter'd nest."

"Thou'rt gone, the abyss of heaven  
Hath swallowed up thy form; yet, on my heart  
Deeply hath sunk the lesson thou hast given,  
And shall not soon depart."

"He, who from zone to zone,  
Guides through the boundless sky thy certain flight,  
In the long way that I must tread alone,  
Will lead my steps aright."

[Bryant's Waterfowl.]

The engraving which accompanies this number of the Mirror, is from a painting by *Weir* from nature. The scene is a romantic little lake, imbosomed in the mountains of the Highlands, on the west bank of the Hudson, and within five or six miles of West Point. It is now commonly called Sutherland's lake, but in former days bore the appellation of Skenando's, from an Indian chief of that name, who had fixed his residence there. He was well known to our Dutch and English ancestors, among the early colonists, and was much beloved by them, for long-continued friendship and many important services. The lake is surrounded by steep, rocky banks, from which the only view is that of the dark quiet water at your feet, the sky above your head, and the summits of neighboring mountains encircling the horizon. It is begirt with the primeval mountain forest, which bears no trace of having ever been touched by any human hand. Here, while the eagle, banished from his old residence on the plains and shores to these his mountain citadels, wheels above your head, high in air, in wide ascending circles, and the silence of the thicket is broken only by the rustling of the leaves under the squirrel or the rabbit, or by the chirp of birds, such as love not man's neighborhood, every thing conspires to give to this spot, the character of profound, tranquil, and (if we may so speak) intense solitude—a solitude the more impressive, from the frequently recurring thought that within a short distance from the mountain walls, hedging

in this lonely lake, flows the great Hudson, the thoroughfare of the Union, bearing on its broad tide the treasures of agriculture, commerce, art and luxury, as well as crowds of travellers, the busy, the gay, the curious and the restless idle, fresh from the great city, or hurrying thither, their minds filled with life's cares, and their hearts throbbing with its hopes, fears, envies, sorrows or fierce desires, and angers.

The artist viewing this scene with a poet's eye, has painted it, as it appears at a time of day and a season of the year most congenial to the feelings, which it is always fitted to excite. He represents it as seen in one of those pensive but delicious hours, that so often occur in our climate, at the close of a mild, bright, calm, autumnal day. The sun has sunk beneath the western mountain-tops, but the skies still glow with the rosy hues of departing light. The glories and freshness of the summer are quite departed, and so, too, are the brightness and splendor, the golden and purple hues of our earlier autumn. The woods are now quite imbrowned, though not yet much thinned of their leaves. In the distance, another indication of the near approach of winter is given, in flights of wild-fowl, just seen against the crimson sky, pursuing their unweary way through the pathless air toward their distant winter home, in the warm south.

The painter, we have said, had looked on this scene with a poet's eye, and he transferred it to his canvass with the feeling of a faithful worshipper and student of nature. Neither adding to, nor varying from, what he saw before him, he has clothed and imbued that literal truth with the expression, the sentiment, the poetry, which the season, the hour, the seclusion of the scene, the very temperature of the air, and the silence of the spot, all unite to breathe into the soul.

But it happened that some years before *Weir* had first sketched this landscape, at the same autumnal season and early evening hour, a scene, not the same, but like this, had been viewed and painted by another of our country's artists, and a great one; and he, too, when "the heavens glowed with the last steps of day," had followed "far through their rosy depths" the lonely water-fowl in his solitary flight, as

"Darkly painted on the crimson sky,  
Its figure floats along."

Thus it was, that when *Weir* had finished his picture, he found that he had but copied from nature what had been copied before with equal fidelity and power, with the same feeling, the same pure and simple severity of taste, the same harmonious union of perfect truth of detail with imaginative ideality of expression and effect. In short, he had embodied on his canvass the thought, the sentiment, the pensive depth, yet tranquillity of feeling that *Bryant* had before clothed in the simplest, but the most poetical of language. In such a coincidence there is nothing to wonder at. For, what the painter had looked upon with a poet's eye, the poet had seen with a painter's; for both were votaries of nature, and had worshipped at her mighty shrine, amidst the twilight of old mossy mountain groves, and the stern solitude of deep lonely glens, and both had drunk gladness and inspiration from her kinder and maternal smile, when

"Came and lingered on their sight  
Of flowers and streams that bloom and fight  
And glory of the stars and sun."

And these, says the poet himself—and who shall deny or doubt his authority—

"And these and poetry are one."

A WINTER IN THE WEST.—The *Montreal Gazette* bears this just testimony to the attraction of Mr. Hoffman's volumes.

The *New Yorker* is a person who ingratulates himself very speedily with his readers indeed we scarcely have time enough to get through half a dozen chapters, before we feel an interest in his movements—are affected by his misfortunes—delighted by his successes—and charmed by all the scenes which he paints.

He who can produce such lively emotions as these, is evidently one of no ordinary endowments. To an accurate eye for the picturesque, an enquiring disposition, and excellent powers of description, he adds a deep and devoted attachment to his subject. It is truly refreshing after

being filled to repletion with scenes in the Peninsula, France, Italy, Turkey, or any other realm to which steamboats ever steamed, or stage-coach rattled, freighted with book-making Cockneys, or Subalterns on the "H. P. unattached" list, to meet with such a work as that before us. It has all the freshness and vigor of the primitive forests, which in its pages we find so eloquently described.

#### SUMMARY.

The name of the "Dutchess" Post Office—in the County of Dutchess of which Isaac Merritt, Esq. is Postmaster, has been changed to Hartsvillage.

**MARCH!**—Not forward, march! nor retrograde, march! but the cold windy forerunner of spring, has nearly spent his fury, and is about to yield his sceptre to his milder successor. We have not in this instance, as in another that we wot of, any forebodings concerning the reign of the successor, for we are quite well pleased with his sway, although he makes his entree with an idiot's phiz and a "Fool" in his mouth. Once in, however, he conducts himself more wisely. —[Lansingburgh Gazette.]

From the Keesville Herald, of the 25th inst. it appears that snow fell in that village on the previous Saturday night and Sunday (23d) to the depth of two feet; and that the weather was cold and the sleighing good.

The Philadelphia papers state that the coal business has commenced for the season at Pottsville. The following is the statement given by the Miner's Journal, for the three days of last week:—Departed, 28 boats, carrying 1,284 tons of coal.

#### APPOINTMENTS BY THE PRESIDENT.

Benjamin Renshaw, to be consul for the port of Laguayra, in the Republic of Venezuela, in the place of John Y. A. Williamson.

Joseph Cullen, to be Consul for the Island of Teneriffe, in the place of Payton Gay.

Samuel Haight, to be Consul for the port of Campeche, in Mexico, in the place of Henry Ferrine.

The London Quarterly Review observes— "That, in painting, the Chinese artists have some colors of their own, which no European skill has as yet rivalled, is a fact as well ascertained as any in the world."

"We once," says the same journal, "heard an eminent lawyer declare, that a clause of an act of Parliament, in which the arrangement of the words was the best that could be, gave him as much pleasure in the perusal as the finest stanza of Spenser's."

**Steamboat Raised.**—The steamboat GENERAL PORTER, which sunk in Black Rock Harbor on Sunday evening, was raised yesterday afternoon, by the aid of two fire engines from this city—the Mayor having given permission to use them for the purpose. It was satisfactorily ascertained that the sinking of the boat was entirely owing to the bursting of the standing pipe through the action of frost. —[Buffalo Com. Adv.]

**EXPENDITURES OF THE GOVERNMENT.**—The following authentic statement of the expenditures of the Government from 1823 to 1833, inclusive, (the last being the latest year to which the accounts were fully made up) is appended to the Documentary edition of Mr. Calhoun's Report upon the growth of Executive patronage:

Statement of the expenditures for the support of the Government of the United States, (including payments on account of pensions, and exclusive of payments on account of the public debt,) from the year 1823 to the year 1833.

Year.	Amount.
1823	\$9,784,154 59
1824	10,328,144 71
1825	11,490,359 94
1826	13,062,316 27
1827	12,653,095 65
1828	13,296,041 00
1829	12,659,490 70
1830	13,229,533 30
1831	13,864,067 90
1832	16,516,388 77
1833	22,713,755 11

It is stated in the New Orleans Advertiser that upwards of five millions of acres of land in Louisiana are subject to annual inundation, and that that amount comprises about one-sixth of the entire territory of the State. From the same paper we learn that the gross amount of land under cultivation does not exceed forty thousand acres, the annual product of which is about ten millions of dollars, or an average of two hundred and fifty dollars per acre. In view of these singular and striking facts, the editor urges the necessity of suitable efforts to reclaim the inundated lands, the profits arising from which would, he contends, be enormous. —[Balt. American.]

Andrew Dunlap, Esq. has, in consequence of the state of his health, resigned the office of Attorney of the United States for the District of Boston.

We noticed the other day, that bacon was in brisk demand, and prices advancing in Cincinnati. The same might justly have been said of pork and lard. All are ready sale, and large purchases have been made. For the last two weeks, the business has been immense. Vast quantities of our produce and manufactures have been shipped for the market below us. There has been activity and bustle of the most cheering character. —[Cincinnati Gazette.]

The Montreal Gazette says that, as the voyagers of the Hudson's Bay Company will be sent off for the Interior and Hudson's Bay as early as the navigation will permit, we are requested to intimate that those having letters to go by that conveyance will require to send them to the Company's office at Lachine by the 20th April.

**A Noble Act, and worthy of imitation.**—Some months since, Mr. Nathaniel Ward, who is deaf and dumb, lost \$0 dollars. It appears that an honest tar found it, and sailed the next day for a port in India. While absent, he, by chance, read in a New York paper the loss of the money, and knowing from the contents that the money belonged to Mr. Ward, Jeek, on his return home, returned the money to the owner. The dishonest, in the higher walks of life, will blush at this fact, of which we have the authenticated particulars. —[Gazette.]

#### [From the United States Gazette.]

**A DOG STORY.**—A gentleman who knows that we are friendly to good dogs, and do not like to see even a cur abused, stopped to tell us a story about one of these half reasoning animals, which we in the exercise of our friendliness, give to our readers.

Last week a large Newfoundland dog, kept in a tan yard in the Northern Liberties, had persuaded a small dog to play with him, and while they were amusing themselves, the smaller animal was accidentally rolled into an open tan pit, in which the water was quite deep, though it did not quite reach within eighteen inches of the edge of the vat. The little fellow floundered about terribly, but could not get out, and the large dog could not reach him. Some of the workmen saw the whole occurrence, and felt disposed to watch at a distance the movements of the Newfoundland dog. He ran round the vat in great concern, then hastened to the building where the men had been, but they were not to be found. He then ran back and took another mournful look at his little play mate, and then tried again for help. None was to be had, and matters were becoming desperate in the vat. The Newfoundland dog then selected a place at the edge of the vat, where some of the tan had been removed, and where the edge was not more than twenty inches above the water. He then stretched himself out, and thrust his fore feet down to the water, edging himself along with care, so as not to lose his balance and fall in himself. This was a matter of nice calculation, as the weight of the puppy was to be added to that of his head and shoulders. At length he appeared to have adjusted the weight to his mind. He then reached out and took the little dog with a strong grip in his fore paws, and being unable, of course, to rise up with the weight hanging over the edge of the pit, he drew himself back with great efforts, and after considerable exertions, succeeded in landing the half drowned dog in safety—and great and sincere was the joy manifested by both animals at the fortunate deliverance.

Wheat was selling at Rochester on the 23d, for 91 cents per bushel. Flour for \$4 and \$4 75 per barrel.

On Tuesday, March 24th, the Bishop of this Diocese laid the corner stone of St. John's Church, Fort Hamilton, Long Island, on a beautiful site presented by the late owners of the Denyse estate. The address was delivered by the Rev. Hugh Smith, of this city. The interest of the occasion was increased by the presence of the troops attached to the Fort, and the accompaniment, in the solemnities, of their Band.—[Churchman.]

We comply with a request to publish the following paragraph:

Mr. Stevens's great match of going on foot 10 miles within the hour, will take place on the Union Course, on Friday the 24th of April, (the weather and state of the course permitting.) As Mr. Stevens has received a great many letters from persons in training for it, we give this notice of the day fixed, and also again state the terms, viz: a purse of \$1000 will be given to the successful competitors—\$500 to the one that comes out ahead, \$300 to the second, and \$200 to the third. If but one performs the feat, he receives the whole purse; if all fail, nothing is paid as in that event Mr. Stevens loses the wager. We also understand that some fine racing may be expected on the same day, and a great display of horses at the Course, in readiness for the first meeting on the 1st Tuesday in May.

Mr. Botts, on whose Course the match will take place, will give any further information to any person interested, by addressing to him at Jamaica, Long Island.

**SURVEY OF BOSTON HARBOR.**—The Legislature of Massachusetts having ordered a Survey of the Harbor, the acting Governor and Council have appointed Leam Baldwin, Col. Thayer and James Hayward, Commissioners for the Survey.

It is a curious fact that our dates from England via *Bahama* and *Charleston* are as late at this moment, as the advices received direct. In both cases they are 47 days old.

**Launch.**—A steamboat of peculiar construction, was launched on Saturday from the point of Corlear's Hook, with her engine on board. She is upwards of two hundred feet in length on deck, very narrow, and we should judge, from her appearance, that she will be a remarkably fast boat. She is owned by Capt. Cornelius Vanderbilt, and is intended to run between this city and Hartford.

Another steamboat, somewhat similar, but much more burthensome, will be launched at Corlear's Hook on Wednesday. She is intended to ply between New York and New Haven. —[Gazette.]

Among the passengers in the schooner Climax, arrived yesterday from Charges, is Capt. Ralph Voorhees, of the U. S. Navy. He left Panama on the 25th ult. at which time the U. S. Sloop of War Vincennes and the Dolphin were lying there, officers and crew all well. Capt. Voorhees is bearer of despatches for Government.

#### [From the Washington Globe of yesterday.]

The following states have yet to elect their members of the House of Representatives, before the next Congress will be completed:

Members.	Elections.
Rhode Island	2 April
Connecticut	6 April
Virginia	21 April
Indiana	7 August
Missouri	2 August
Maryland	8 October
Kentucky	13 August
North Carolina	13 August
Alabama	5 August
Mississippi	2 May
Tennessee	13 August

The "half human savages" in New Holland, have been found by travellers to be the best of

mice.—Coleridge remarks that, in civilized society, minds of the very lowest stamp alone satirize by copying.

**Burden's Patent Horse Shoes.**—We were shown a few days since, some patent Horse Shoes, made at Troy, is a machine, the invention of Mr. Burden, the constructor of the steamboat, which was unfortunately lost last year on the North River. These shoes are manufactured of wrought iron, and the iron is put into one end of the machine, and comes out at the other end a complete horse shoe, curved, regulated and uniform. We understand that the machine, throws off thirty in a minute! This invention cannot fail to secure a liberal recompense to Mr. Burden, who was so great a sufferer, in a pecuniary point of view, by the loss of his boat.

In conversation with Mr. B. the other day, he informed us that a boat on his plan was now building in Troy, intended to run on the Farmington, Hampden and Hampshire Canal, and that she would go in operation in the course of a month or two. He has received letters from gentlemen of science in Paris, on the subject of his boat,—and one has been constructed on his model, to ply between Paris and Rouen.—[Gaz.]

**Natural Gas Works.**—A most remarkable fact is stated by the Abbe Imbert, who visited China a few years since. By means of tunnels of bamboo places in communication with fountains of carbonated hydrogen in the bowels of the earth, as many as three hundred chaudirons are supplied with heat for boiling. Streets, halls, work shops are all lighted by this gas, which is the same used in all artificial gas works. Arago says that several villages in the United States have long been supplied in this manner. This expression is a little too strong, though it is true, we believe in respect to Frobonia, on Lake Erie, in our State, where the light house is also supplied in this way from natural sources. In Ontario county, near Cacandagut, there are also several of these gaseous emissions from the surface of the earth. They are called, in common parlance, 'Burning Springs'.—[American Traveller.]

[From the Appeal.]

**THE BEST MODE OF DYING.**—The notions of mankind respecting the easiest, and most comfortable, mode of "shuffling off this mortal coil," are exceedingly various and contradictory. Some think drowning is the easiest mode; and there are not wanting those who profess to have tried it, who say, "it is as easy as preaching!" that when they have once sunk to rise no more—when they are lying flat on their backs in the bottom of the ocean, river, or whatever body of water it may be—when breath has departed, and night has gone out, and they are just taking their leave of sublunary things, they feel as happy as a prince on the day of his coronation, or a man on his wedding night—that a thousand pleasant and "delectable shapes" run sporting and dancing through the brain—that their ideas are most delightful, and their sensations most ecstatic—and, in short, that it is really worth while for a man so to die now and then for the pure enjoyment of the thing.

Some think that freezing must be the most delectable mode of putting out the fire of life; and a paragraph is now going the rounds, which asserts and describes the incomparable pleasure of dying through the medium of frost. It is so cool and comfortable! And then one goes out of the world with a charming numbness to all the "ills that flesh is heir to," at the same time that he carries with him a "stiff upper lip."

Others again think the better mode of "shuffling off this mortal coil," is to put a coil about their necks. And those who hold this opinion, seem to be the most numerous party, judging from the great majority of suicides that depend on a rope. Whether these think it the most ecstatic mode of dying; or whether, like Jack Ketch, they consider it the "only natural death;" or whether in the third place, they adopt it as a means of raising them nearer to Heaven—not having any direct information from those who have fairly killed themselves—we cannot decide.

Some prefer a pistol—probably that they may make a noise in the world at the time of their

death. If "report shall no more be made of them," they have at least made a report of themselves at their going off. Some prefer the knife; some the dagger; but most—the bowl; we mean the intoxicating bowl, which usually allows them the luxury of two or three years death.

**Females**—rejecting all coarse, bloody, and disgusting modes of departing this life—prefer being squeezed to death. Encasing their fair bodies in a tight boddice, until the soul case is too narrow for the soul, they had rather go off in the prime of life by stays, than to stay behind and finally go off through the tottering footsteps of old age.

The ancients, as well as moderns, had various tastes in dying. Curtius leaped the yawning gulf, armed capapie, with a good horse under him. Brutus fell upon his sword; Cassius ditto. and Cato the same. Seneca opened his veins, and bled to death leisurely, while enjoying the luxury of a warm bath. Cleopatra, the charming queen of Egypt, preferred dying by means of a venomous serpent, an asp. And Sappho, the poetress, employed her feet in leaping from a huge rock into the sea.

But among the various deaths by which mankind, either ancient or modern, have preferred to take themselves off, we do not know of any well authenticated case, where the traveller has once passed the bourn of life, that he has ever returned to give an account of the particular delights of their exit. It is difficult, therefore, from any evidence, to be at all relied on, so to compare notes as to be able to decide on the easiest, most judicious, and comfortable way of departing this life.

As for those who pretend to pronounce by their own experience, in favor of freezing, drowning, or any other special mode, we take them to be little better than false knaves, who were never "clean dead" in all their lives; and we advise every body patiently to

"Wak the great teacher, Death."

rather than give heed to the pernicious accounts of a set of voygers, who were never out of sight of this earthly land, and who are not to be relied on.

**Easy Joe Bruce.**—By H Hastings Wald.

"The devil!" exclaimed Mr. Joseph Bruce, or perhaps we should rather say Joe Bruce,—for as he was a noble, easy fellow, no body thought of allowing him more than a half of a name, or of anything else which belonged to him. "The devil! I see by the paper that Hawk and Harpy have assigned. I meant to have secured my debt yesterday!" He left his coffee half drunk, stumbled over the threshold, and went almost at a run to the counting room of Hawk and Harpy.—One half of that speed the day before would have saved his debt; as it was, he was just in season to put his name at the bottom of a dozen and a half preferred ones, to receive ten per cent. He went back to his unfinished breakfast with what appetite he might.

"Why did you neglect this so long, Mr. Bruce?" said his helpmate and comforter,

"I meant to have attended to it yesterday, my dear."

"You meant! That is always your way, Mr. Bruce. You carelessly neglect your business to the very last moment, and then put yourself in a haste and heat for nothing, my dear."

"Really Mrs. Bruce—"

But Mrs. Bruce did not allow him a chance to defend himself. On she went, in the most approved conjugal manner, to berate him for his carelessness and inattention.

"Really Mrs. Bruce—"

And it was really Mrs. Bruce, for few of the feminine, and none of the masculine gender could have kept pace with her. Certainly easy Joe Bruce could have not. The clatter of a cotton-mill would not have been a circumstance to the din she raised—nay we doubt whether a philippic against one of those said mills from the lungs of Benton Tomens could have been heard above her voice; Easy Joe pulled a cigar case out of his pocket—clapped his feet on the fender—and it almost seemed that the smoke rendered his ears impervious to the bleatings of the gentle lamb, his spouse, so placid was his countenance as the vapor escaped in graceful volumes from his mouth. But people overshoot the mark

sometimes; Mrs. Bruce certainly did. Had she spared her oration, the morning's loss would have induced her husband to have been punctual to his business, for one day at least. As it was, he took the same sort of pride in neglecting it under her lecture, that the Grande Nation will probably take in refusing to pay the claims of our citizens.

"Breeze away, Mrs. Bruce!"

"Breeze away sir! Breeze away! I wish I could impart one tithe of my energy to you, Mr. Bruce—I—I—"

"D—n—t—n, Madam."

As Bruce sprang to his feet, crash! came an elegant mantle clock down upon the hearth!

"There, Mr. Bruce! that clock has stood there three months without fastening—a single screw would have saved it—but—"

"Well, I meant to—"

"You meant! Mr. Bruce—You meant won't pay the damage, nor Hawk and Harpy's note! You meant! indeed!"

Bruce seized his hat and cloak. In a few minutes he was on 'Change. Nobody could read in his face any traces of the late matrimonial breeze, and nobody would have suspected from his countenance that Hawk and Harpy failed in his debt. Easy Joe Bruce.

"Well Mr. Bruce they've routed him."

"Who?"

"Our friend Check. Pingree was chosen President of the—Bank, this morning: one vote would have stopped him."

"How deucedly unlucky. I meant to have been present to vote for Check myself?"

"Never mind, Bruce, said another. 'You are a lucky man. The news of the great fire in Speederville has just reached town by express, and I congratulate you that you was fully insured.'

"The devil My policy expired last week, and I meant to have got it insured this morning."

Joe posted home in no very happy humor.—When an easy man is fairly up, he is the most uneasy and unreasonable man in creation.

"Mrs. Bruce, by staying at home to hear you scold, I have lost thousands. I meant to have got insured this morning—I did not—Speederville is burnt down and I am a beggar."

"Why did you not do it yesterday Mr. Bruce?"

"I was thinking of Hawk and Harpy."

"Thinking! Why did you not secure yourself?"

"I meant to, but—"

"But—me no buts."

"You are in excellent spirits, Mrs. Bruce."

"Never in better."

"Vastly fine Madam. We—"

Mrs. Bruce set down, clapped her feet on the fender after her husband's manner in the morning.

"We are beggars, Madam," Bruce replied.

"Very good—I will take my guitar, and you shall shoulder the three children. We'll play under Mr. Hawk's window first and then under Mr. Harpy's, and then beg our way to Speederville to play to the ashes of what was once your factory,—which you meant to have insured. I should like begging of all things."

"You abominable woman I shall go mad."

"Don't, I beseech you, Mr. Bruce. They put mad beggars in Bedlam."

Bruce sprang for the door. His wife intercepted him. "Here, Joseph, is a paper I meant to have showed you this morning."

"A policy! And dated yesterday?"

"Yes. You meant to get it renewed to-day—I meant it should be done yesterday—I told your clerk, from you, to do it. Am I not an abominable woman?"

"When I said so I was in a pet, I meant—"

"No more of that Joseph. Now tell me who is first on Hawk & Harpy's assignment."

"Your brother. I wish I had your energy or even his."

"His claim covers you both."

"You are an angel!"

Easy Joe became an altered man, and his wife was released from her watch over his out door business. She died some years before him—and we are inclined to suspect that after her death Joe partially relapsed into his old habits—so true it is that habit is a second nature.

[From the American Journal of Science and Arts.]

*A live Snake suspended by Spiders.*

BATAVIA, N. Y., Sept. 30, 1835.

Sir,—In the "Spirit of the Times" of this village, of the date of Aug. 26, 1834, I published over the signature of "A Witness" an account of a *snake* found suspended by spiders' web, by the tail, in the wine cellar of a gentleman in this village.

A gentleman who also saw and examined the phenomenon, promised to send you a drawing and account of it. Whether he has done so or not, I do not know. And as the story has been treated as a fable by some of the papers, I send you enclosed the account above mentioned, and a correct drawing, (though rough and done in haste,) made by James Milnor, Jr. Esq., a clerk in the Holland Company Land Office.

The gentleman in whose wine cellar the snake was found, is the Hon. David E. Evans, agent of the Holland Land Company, who requests me to forward to you the drawing and account, which he pronounces to be accurate.

Mr. Evans, Mr. Milnor, Mr. Mix, Doct. Van Tuyl, and a great number of other gentlemen, examined this subject *critically* on several different days, while the snake was yet alive, and all concur in the accuracy of the account.

I hope you will procure a correct engraved cut of the drawing, and publish it with the account in your journal. And if you do, you are at liberty to use all the names mentioned in this letter, or to publish it at length, if you think proper.

Most respectfully, your ob't servant,  
S. CUMMINGS.\*

The following is the account alluded to in the above letter:

On the evening of the 13th inst., a gentleman in this village found in his wine cellar a *live Striped Snake*, nine inches long, suspended between two shelves, by the tail, by spiders' web. The snake hung so that his head could not reach the shelf below him; by about an inch; and several large spiders were then upon him, sucking his juices. The shelves were about two feet apart; and the lower one was just below the bottom of a cellar window, through which the snake probably passed into it. From the shelf above it, there was a web in the shape of an inverted cone, eight or ten inches in diameter at the top, and concentrated to a focus, about six or eight inches from the under side of this shelf. From this focus, there was a strong cord made of the multiplied threads of the spiders' web, apparently as large as common sewing silk; and by this cord the snake was suspended.

Upon a critical examination through a magnifying glass, the following curious facts appeared: The mouth of the snake was fast tied up, by a great number of threads, wound around it, so tight that he could not run out his tongue. His tail was tied in a knot, so as to leave a small loop, or ring, through which the cord was fastened; and the end of the tail, above

this loop, to the length of something over half an inch, was lashed fast to the cord, to keep it from slipping. As the snake hung, the length of the cord, from his tail, to the focus to which it was fastened, was about six inches; and a little above the tail, there was observed a round ball, about the size of a pea. Upon inspection, this appeared to be a green fly, around which the cord had been wound as the windlass, with which the snake had been hauled up; and a great number of threads were fastened to the cord above, and to the rolling side of this ball to keep it from unwinding, and letting the snake down. The cord, therefore, must have been extended from the focus of the web, to the shelf below, where the snake was lying when first captured; and being made fast to the loop in his tail, the fly was carried and fastened about midway, to the side of the cord. And then, by rolling this fly over and over, it wound the cord around it, both from above and below, until the snake was raised to the proper height, and then was fastened, as before mentioned.

In this situation the suffering snake hung, alive, and furnished a continued feast for several large spiders, until Saturday forenoon, the 16th, when some persons, by playing with him, broke the web above the focus, so as to let part of his body rest upon the shelf below. In this situation he lingered; the spiders taking no notice of him, until Thursday last, eight days after he was discovered; when some large ants were found devouring his dead body.

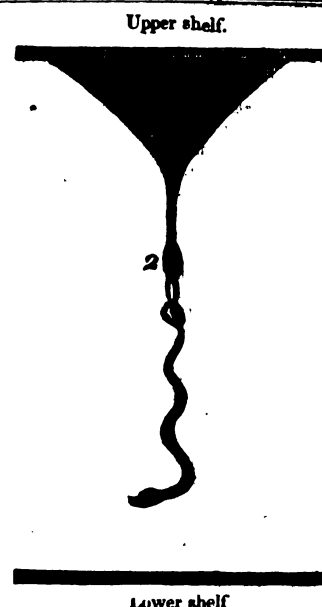

A WITNESS:

As this extraordinary case has been doubted, we think it fair to annex the account of another witness, which will be seen to be similar to that of Judge Cummings, but not identical.—Ed.

NEW-YORK, Aug. 26, 1834.

Dear Sir,—Enclosed I take the liberty of sending you a rude sketch of a curiosity, which came under my observation a short time since. A gentleman residing in the village of Batavia, N. Y., on going into his wine cellar, discovered a striped snake, about ten inches in length, suspended by and from the web of a spider, in a manner precisely similar to the enclosed sketch. From a survey of the premises, it would appear that the snake had taken up his abode upon one of the shelves in the cellar, when the spiders (for there are three which appear to be engaged as partners in the business) first formed the design of making him their captive. For this purpose they formed a large web upon the under side of a shelf directly above the snake, from which they descended, and made fast a large number of fibres to different parts of his body, bracing them in every direction, so as to prevent his escape, and render their operations more secure; they next proceeded to muzzle him, by winding a web many times around his head, so as entirely to deprive him of the use of his mouth.

\* We understand that Mr. Cummings is first Judge of the Court of Common Pleas in this county, and also Postmaster of Batavia.

Having thus secured him, they next set to work to suspend him from their web. You will observe a knot in the tail of the snake. How this was formed I am unable to say; but certain it is, that the spiders took advantage of it, and by winding the knot with a web, prevented the possibility of loosing it. They then apparently proceeded to attach a large number of fibres, running from various parts of the web above, to the loop formed by the knot, which they glued and fastened together by winding them with another fibre, thus forming a strong cord. This done, the most difficult part was yet to be performed, and this was to swing him clear from the shelf. To do this, they procured a large *blue fly*, (2,) which they made fast to the web or cord, and by continuing to roll the fly over in the web or cord, and making it fast to each turn, they were enabled to swing the snake about three inches clear from the lower shelf. The snake was alive and active when discovered, and five days after, when I was there last, he was still living, suspended in the manner above described. During the day, no spiders were visible in or about the web, but at night there were three, much smaller than the common fly, seen feeding upon the body of the snake.

Very respectfully, your ob't servant,  
D. LYMAN BEECHER.

The inquiry has been made, whether the snake might not have fallen by accident into a web previously made, and thus have become inextricably entangled.—Ed.

**MECHANICAL POWERS.**—From a late foreign periodical we have gleaned the following interesting items, by which it will be seen that steam is not the only, and perhaps not the most economical power, that may be used for mechanical purposes. Much yet remains to be discovered in the arena of nature.

**New Moving Power.**—At a meeting of the French Academy of Sciences, on the 16th of June, a very interesting communication was read from M. Thilorier, a skilful chemist, who exhibited to the Aca-

demey the apparatus by which he procured a litre (a quart) of liquid carbonic acid in a few seconds. The properties of this substance, he observed, have been but little examined, chiefly because it requires to be confined in close vessels, hermetically sealed, and capable of resisting a great pressure. It surpasses all known bodies in the expansion and contraction which it undergoes from given variations of temperature; from 32 to 96° Fahrenheit, a column of the liquified gas is elongated one half. With the same change of temperature a similar column of air is only elongated one-eighth. This enormous dilation, M. Thilorier thinks, will, in future, afford the elements of a moving power infinitely more effective, as well as economical, than that which is derived from the expansion of vapor.

**New Mechanical Power.**—An ingenious mechanic at Brussels has just applied a new power to mechanics, from which great results appear to be expected. This new power is galvanism. Across a fly-wheel, which is to give motion to the machine, he has placed a metallic bar, previously magnetised by a galvanic pile, and within the attraction of two very powerful magnets. The moment that the bar arrives in a rotary course at the limit of the attractive power, and when it would necessarily stand still, the inventor, by the application of galvanism, suddenly converts the attractive into a repulsive power, which continues the motion in the same direction, and by these alterations, well managed, the whole acquires a rapid rotation. The experiment is said to have been completely successful, and the machine worked a whole hour.

**BOTANIC PRIZES.**—About five years ago, the Society of Apothecaries, in London, instituted two prizes, a gold and a silver medal, for the best written and oral examination in medical botany. Two students, Edwin Edin and Arthur Tibson, took the medals. This is a remarkable circumstance, and evidences either a want of industry or a want of research, or both, in those who have the reputation of being vastly wiser than they really are.—[Scientific Tracts.]

**Lisbon Aqueduct.**—The magnificent aqueduct that furnishes the city of Lisbon with water, and which has been cut off by the army of Don Miguel, may be regarded as one of the handsomest modern structures in Europe. From report, it will not yield in grandeur to any aqueduct left us by the ancients. That portion of it situated in the valley of Alcantara, about a mile from Lisbon, is of admirable structure, consisting of thirty-five arches at least, by which a stream of the purest water is carried across a deep valley formed by two mountains. The height of the middle arch, from the base to the summit, is 263 feet 10 inches; the breadth of the principal arch is 107 feet 8 inches. Each block of stone is in general 23 feet high. The arches on each side diminish in thickness, in conformity to the size of the stones, which, at the termination, are only 8 feet. They

owe the execution of this magnificent monument to John V., who laid its foundation in 1718; nineteen years after which it was completed. The expense was covered by a tax of one real upon every pound of meat sold in the capital.—[Ib.]

**NEW MODE OF MAKING SPECTACLES.**—Before the Eclectic Society, Mr. Samuel, an optician, exhibited a contrivance which was technically called a *slitting machine*, the use of which was to cut or slit out crystal lenses, for spectacles. It seemed to attract considerable notice, and it is probably calculated to be of essential service in the arts, at least.—[Ib.]

Not these the joys that could my bosom swell,  
But o'er my name, gentle lay—some witching spell—  
To pore unweary'd, or some graver page,  
Or laughing wit, our evening hours engage—  
At sunset rove together ocean's side,  
Sooth'd by the murmur of its flowing tide,  
I sit to its roar—and with a poet's ear—  
In its deep mutterings, future tempests hear,  
Some in each blast—a wreck in every wave,  
In fancy start, some struggling form to save,  
Or wand'ring 'neath rich autumn's golden sky,  
Tremble and Tarnow in its clouds copy—  
See Moor and Christian in its fading glow,  
The cross triumphant—and the crescent low—  
Down with the lightning, shouted with each gleam  
Of vision'd fashions, mixed with Moorish scream,  
Then wake 'as I do now, from poet's dream,  
And oh! Celestial Maid, whose gentle power,  
Can soothe the sadness of our bitter hour—  
Mistress of each sweet spell, all harmony,  
Music—bright triumph—what pleasures spring from thee?  
Soft lay—the frolic glee—the social dance—  
Gather fresh spirit, from thy merry glance,  
I own thy power—at humble distance tread  
And follow gladly, where thou hast led.  
Still dearer joys than these, my woman's soul,  
Would crave, to mother's known the sweet control  
Of infant love—of childhood's raptures him,  
On can there be a greater joy than this?  
To feel their little arms around you twine,  
And see their eyes, with true affection shine,  
Their artless smiles, so dearly bought, betray—  
The deep, deep love—that their pure bosoms sway;  
Oh! I can find, in childhood's whisper low—  
A balm for grief, a cure for every woe—

H.L.A.

SONG.

By Miss E. L. MONTAGUE.

Oh dianna, dianna blame him, mother,  
Mama blame him, now he's gone;  
Bethink you the days, mother,  
When he was a' my ain.  
We twa us' roamed where the bracken bend,  
The brany breeze sang;  
We twa had loved ere either knewed  
His love could e'er be wrang.  
Oh, dianna, dianna seek him, brother,  
If ye would see me die—  
His hand is on the stool, brother,  
And his border blood is high.  
Ah seek him ne'er wi' vengeance, ee,  
For I forgive him a',  
An' ye maun stop to comfort me  
When he is far awa'.  
Ah dianna, dianna greet, sister,  
See him lately and sair  
Cast the tear-drop frae your een, sister,  
An' mine shall weep an' sair.  
Oh, never mair we'll name the name  
O' this fane love o' mine,  
But we'll turn again unto our home,  
An' the memory o' lang syne.  
But dianna, dianna curse him, father,  
Ye kenna what ye do;  
O, think upon the time, father,  
When he was gude an' true.  
Or if that bitter word mean steal  
Frae lips where blessings be,  
Oh, blaw the wind I have me woe,  
An' that's the curse on me.

STEPHANSON.

Builder of a superior style of Passenger Cars for Railroad.

No. 264 Elizabeth street, near Blocher street, New-York.

IF RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad now in operation. J.B.C.

RAILROAD CAR WHEELS AND BOXES, AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to.

Also, CAR SPRINGS

Also, Flange Tires turned complete.

JO ROGERS, KETCHUM & GROSVENOR

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be able, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.

August 15 1833.

ASD:R&M&F

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with classes made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by

E. & G. W. BLUNT, 144 Water street, corner of Maiden lane.

J.B.C.

SURVEYING AND ENGINEERING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, to principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new, among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also a Railroad Goniometer, with two Telescopes—and a Leveling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

W.M. J. YOUNG,

Mathematical Instrument Maker,

No. 9 Dock st., Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

Baltimore, 1833.

In reply to the inquiries respecting the instruments manufactured by me, now in use on the Baltimore and Ohio Railroad, I cheerfully furnish the following information. The whole number of Levels now in possession of the department of construction of this make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repair, except from accidents to which all instruments of the kind are liable.

I have found that the patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES F. ETABLER, Supt of Construction

of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. B. GILL, Civil Engineer.

Germanstown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY B. CAMPBELL, Eng. Philad.

and by German and Norfolk Railroad

**To Primrose Filled with Morning Dew.**

By H. HANCOCK, 1848.

Why do ye weep, sweet babes? Can tears  
 Speak grief in you  
 Who were but born  
 Just as the modest morn  
 Teem'd her refreshing dew?  
 Alas! you have not known that show'r  
 That came a flower;  
 Nor felt th' unkind  
 Breath of a blasting wind;  
 Nor are ye worn with years;  
 Or warp'd as we,  
 Who think it strange to see  
 Such pretty flowers, like to orphans young,  
 To speak by tears before ye have a tongue.  
 Speak, whimp'ring younglings; and make known  
 The reason why  
 Ye drop and weep,  
 Is it for want of sleep;  
 Or childish lullaby?  
 Or, that ye have not seen as yet  
 The violet?  
 Ye brought a kiss  
 From that sweet heart to this!  
 No, no—this sorrow  
 By your tears shed,  
 Would have this lecture read—  
 "That things of greatest, so of meanest worth,  
 Unseen'd with grief, are with tears brought forth."

**GOLD REGION OF THE UNITED STATES.**

Now in press and will be published in a few days, the first of a series of numbers, giving a minute and particular description of the entire Gold Region of the United States.

Each number will be accompanied by a Map, on which will be laid down, and numbered, with owner's name, in the order of discovery, of every Gold Mine within the district of which the number treats, so that any person can ascertain the location, owner's name, and condition, as late as January 1, 1835, of every Gold Mine, or place where gold has been discovered in the United States.

The first number, which will be issued by the 20th of April, will give the Gold region of North Carolina: together with a very interesting Essay, upon the Gold region of the United States, from the transactions of the Geological Society of Pennsylvania, by James Dickson, Esq., P. G. S. of London, C. M. G. A. of Pennsylvania, &c. &c.—With other interesting and important information in relation to the supply and consumption of Gold.

The information and maps are by a scientific gentleman, who has visited personally what he describes.

No. 2, including the States of Virginia and Maryland, will be published by the first, or during the month of, June.

No. 3, giving Pennsylvania, New Jersey and New York, by the first of August. And the succeeding numbers, 4 and 5, which will probably complete the series, by the first of January next.

The terms will be \$1 per number, or \$5 for the Series.—Subscriptions addressed to D. K. MINOR, or to the publishers,

T. &amp; S. WOOD.

No. 7 Wall street.

Gentlemen who may have particulars, or details, of present condition of mines in North Carolina, will oblige me by communicating the same, that the work may be as complete as possible.

D. K. MINOR.

**NOTICE.**

The Board of Directors of the NEW YORK AND BUREAU RAILROAD COMPANY, believing that the interests of this City demand that the construction of their Railway should be immediately commenced, and having resolved, with undiminished confidence in the merits and early productiveness of the undertaking, to proceed in their operations without delay, hereby give Notice, that in order to provide means adequate to the completion of a single trunk of the Railway over an extended and most important portion of the route, subscriptions for Two Millions of the capital stock will be received at their Office, No. 29 Wall street, on the 15th day of April next, and the two succeeding days. Five Dollars on each share is required to be paid at the time of subscription.

It is to be understood that no further issue of Stock will be made within two years, and that it is the object of the Company, before the expiration of that period, with this and the former subscription, to put such portion of their Road in operation, as will, they confidently believe, yield a profitable return on the cost thereof.

New York, 30th March, 1835.

By order of the Board.

JAMES G. KING,  
 JOHN G. COSTER,  
 PETER C. STUYVESANT,  
 MICHAEL BURNHAM,  
 ELIAZER LORD,  
 GOULD HOYT,  
 STEPHEN WHITNEY,

Committee to receive Subscriptions.

m:30 1A18

**RAILROAD JOURNAL AND ADVOCATE OF INTERNAL IMPROVEMENTS.**

This work is published once a week, in quarto form of EIGHT pages, devoted mainly to the subject of internal improvements, in all its various modes and forms.

Three volumes were completed in December, 1834, and the 4th volume is now in progress.

Terms, \$3 a year, IN ADVANCE. Previous volumes same price; full set of four volumes, \$12.

**RAILROAD AND CANAL MAP.**

Or a Map of the United States, 24 by 40 inches, on which is delineated all the Railroads and Canals in use, or in course of construction, and most of those in contemplation; together with a concise description of, or reference to, each, and containing over 70 pages of letter press. The map is on bank note paper, and put up in pocket form, with morocco cover, or in paper cover, and may be sent by mail to any part of the country. Price \$2.

**MECHANICS' MAGAZINE, AND REGISTER OF INVENTIONS AND IMPROVEMENTS.**

This work has completed 4 volumes, or two years. It is published monthly, in numbers of 64 pages each, in large octavo form, and forms two good sized volumes a year, of 384 pages each.

This work is STEREOTYPED from the first number, and therefore any number of copies may be obtained from commencement, if desired. It has many able correspondents, who furnish original communications, in addition to its selections from the best European periodicals of the day, with numerous engravings and illustrations of the subjects on which it treats. The Mechanics' Magazine may be considered as one of the permanent periodicals of the country. Price, \$3 per annum, IN ADVANCE. Previous volumes \$1.50 each.

**THE APPRENTICE'S COMPANION—**

A monthly publication, in large octavo form, of sixteen pages each number—designed to persuade APPRENTICES, and others, to habits of INDUSTRY, TEMPERANCE, and FRUGALITY—is published at the office of the MECHANICS' MAGAZINE, No. 35 Wall street, New York, for FIFTY CENTS a year—for 12 numbers—by

D. K. MINOR.

All letters must be postage paid. Eleven numbers sent to one address for \$5,—and TWENTY-THREE for \$10.

D. K. M.

**NEW-YORK FARMER AND AMERICAN GARDENER'S MAGAZINE.**

This work is devoted mainly to AGRICULTURE and HORTICULTURE; it, however, treats upon various other subjects more or less connected with them. It is now in its 8th volume, or 3d volume, new series, and is designed to be made equal to any work of the kind in this or any other country. No reasonable expense will be spared, either to secure the best writers the country affords, or to furnish engravings and illustrations. It is published monthly in large octavo, 32 pages per month, at \$3 per annum, and when paid in advance eight additional pages per month are given. Volumes 6 and 7, or 1 and 2, new series, \$3 per volume.

**QUARTERLY JOURNAL OF AGRICULTURE, MECHANICS, AND MANUFACTURES.**

This work is composed of the choicest articles of the three preceding works; its character may therefore be understood by reading those advertisements. It has been published at \$5, but will be, hereafter, at \$4 per annum—always in advance; each quarterly number to contain about 220 pages.

These works may all, or either of them, be had of S. Blydenburgh, 96 North Pearl street, Albany; D. Hale, 124 Washington street, Boston; Fessenden, Philadelphia; or of the Proprietor and Publisher,

D. K. MINOR,

35 Wall street, New-York.

**PATENT HAMMERED SHIP, BOAT, AND RAILROAD SPIKES.**

Railroad Spikes of every description required, made at the Albany Spike Factory.

Spikes made at the above Factory are recommended to the public as superior to any thing of the kind now in use. Ship and Boat Spikes made full six under the head, so as not to admit water.

Orders may be addressed to Messrs. ERASTUS CORNING & CO., Albany, or to THOMAS TURNER, at the Factory, Troy, N. Y. sept. 13-1 v

TOWNSEND & DUFFEE, of Painesville, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jarvis, Eng. M. & H. R. R. Co. Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania.

Hudson, Columbia county, New York,  
 January 29, 1835.

**RAILROAD CASTINGS.**

MANY & WARD, Proprietors of the Albany Eagle Air Furnace and Machine Shop, will make to order cast wheels, chairs and knees, and every other description of casting required for railroads. R-1 y feb14

**RAILWAY IRON.**

95 tons of 1 inch by 1 inch,	Flat Bars in lengths of
200 do. 1 1/2 do. 1 1/2 do.	14 to 18 feet, counter sunk
40 do. 1 1/2 do. 1 1/2 do.	holes, cut out at an angle
800 do. 2 do. 2 do.	of 45 degrees, with splicing
800 do. 2 1/2 do. 2 1/2 do.	plates and nuts to suit.

soon expected.  
 250 do. of Edge Rail of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 3 3/4, and 4 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

A. &amp; G. RALSTON.

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use both in this country and Great Britain, will be exhibited to those disposed to examine them.

d11mccw

**PATENT RAILROAD, SHIP AND BOAT SPIKES.**

The Troy Iron and Nail Factory keeps constantly for sale every extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent), are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1831.

Spikes are kept for sale, at factory prices, by J. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. I. Brewer, 222 Water street, New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes.

J12am

H. BURDEN.

**MILL DAM FOUNDRY FOR SALE.**

The Proprietors of the Mill Dam Foundry offer for sale or lease their well known establishment, situated one mile from Boston. The improvements consist of

No. 1. Boiler House, 50 feet by 30 feet, containing all the necessary machinery for making boilers for Locomotives and other steam Engines.

No. 2. Blacksmith's Shop, 50 feet by 30, fitted with cranes for heavy work.

No. 3. Locomotive House, 54 feet by 25, used for putting together Locomotive Engines. Several of the best Engines in use in the United States have been put in this establishment.

No. 4. A three story brick building, covered with slate, 190 feet by 40, containing two water-wheels, equal to 40 horse power; Machine Shop, filled with lathes, &c.; Pattern Shop; Rolling Mill and Furnaces, capable of rolling 4 tons of iron per diem, exclusive of other work; three Trip Hammers, one of which is very large; Engine for blowing Cupola Furnaces, moved by water-wheel; one very superior 12 horse Steam Engine, which could be dispensed with; and a variety of other machinery.

No. 5. An Iron Foundry, 80 feet by 45, with a superior air Furnace and two Cupolas, Core oven, Cranes, &c. fitted for the largest work. Attached to the Foundry is a large ware-house, containing Patterns for the Castings of Hydraulic Presses, Locomotive and other Steam Engines, Lead Mill Rolls, Gearing, Shafts, Gears, Grates, &c. &c. These were made of the most durable materials, under the direction of a very scientific and practical Engineer, and are supposed to be of great value.

No. 6. A building, 65 feet by 26, containing a large stock of chimneys and furnaces, for making Cast Steel. This building is at present used as a boarding-house, and can accommodate a large number of men.

No. 7. A range of buildings, 300 feet long by 26, containing counting room, several store rooms, a Brass Foundry, room for finishing castings, a large loft for storing patterns, stable for two horses, &c. &c.

The above establishment being on tide water, presents greater advantages for some kinds of business than any other in the United States. Coal and iron can be carried from vessels in the harbor of Boston, to the wharf in front of the Factory, at 25 to 30 cents per ton. Some of the largest jobs of iron work have been completed at this establishment; among others, the great chain and lift pumps for freeing the Dry Dock at the Navy Yard and Charleston.

The situation for Railroad work is excellent, being in the angle formed by the crossing of the Providence and Worcester Railroads. The Locomotive "Yankee," now running on the latter road, and the "Jonathan," purchased by the State of Pennsylvania, were built at these works. With the Patterns and Machinery now in the premises, 12 Locomotives and as many tenders, besides a great quantity of cars and wagons, could be made per annum.

For terms, apply to

THOS. J. ECKLEY, Treasr. &c., Boston, or to  
 ROBERT RALSTON, Jr., Philadelphia.  
 Boston, Dec. 30, 1834.

## AMERICAN RAILROAD JOURNAL.

NEW-YORK, APRIL 11, 1835.

We continue in this number the Report of Mr. Mills upon his survey of the Rochester and Olean Canal.

We would take this opportunity to correct an error in the 12th No. In a short editorial introduction to an extract from Mr. Mills' Report, showing the comparative distance of the three great routes from this city to the Ohio River, it was said to be from Mr. Johnson's Report, whereas it should have been "from Mr. Mills' Report."

### Railroad Locks.

To the Editor of the Railroad Journal:

Sir,—Locks on railroads, like most other departures from established modes, will have to contend with ridicule and opposition; and whether their merits can sustain their pretensions, experience must determine. Public safety, without regard to pecuniary considerations, demands some other than the present method of surmounting elevations, by inclined planes and stationary steam engines; and locks are now proposed for public consideration, as a substitute. The immense capital already contemplated to be invested in railroads, (42 being completed, and 146 projected,) the spirit of emulation that exists in several

States, to surpass each other in that mode of intercourse, and the general predilection prevailing throughout the Union in their favor, gives any probable improvement in the safety, economy, and convenience of their construction, claims worthy of attention. The numerous inventions that are daily urged on the public, of no practical utility, and the pertinacity with which men adhere to preconceived opinions, render it difficult, without great exertion, to bring in to general and immediate use designs highly important to community.

Improvements, however, are so rapid, and the country has derived such acquisitions of general prosperity and convenience, from steam navigation, railroads, and canals, that locks, so internally connected with a favorite subject of public interest, may find less difficulty of access to public patronage and confidence, than usually attends new designs. In presenting the subject to the public, the relative claims of railroad locks, and inclined planes and stationary steam engines, to the important considerations of safety, economy, and expedience, will be submitted, though the latter of the two modes being the only one in use, will not require other than general remarks. It is justly observed by Mr. Smith, editor of Wood's Treatise on Railroads, that inclined planes and stationary steam power "are an opprobrium to the present advanced state of civil engineering;" and they certainly betray a greater want of invention than displays itself in any other case, where the necessity of improvement is so evident.

That method of surmounting altitudes, since its adoption, has been a subject of complaint in England, and the fatal disasters they have occasioned strongly pressed for their discontinuance. In the United States, their destructive effects are not as generally known, or yet as severely felt; but the frequent accidents attending their operations on the Alleghany Mountains, and other places, have produced sentiments of disapprobation, that are gaining ground in the public mind. The only recommendation that inclined planes have to sanction their continuance is speed; and that, in the

opinions of reflecting men, will not compensate for the least of the three objections to that mode of ascending. The views of the editor above alluded to are pertinent, and express the sentiments of those acquainted with the danger, expense, and inconvenience of that mode of ascending; he observes, "hence, any available plan, which will enable locomotive engines to ascend, with their full complement of wagons, without the intervention of stationary engines, and their appendages, will be a most valuable addition to the utility of railways, and unless the weight to be overcome be greater, compared with the length of the whole line, the delay resulting from a diminution of speed will be a trivial inconvenience, when the advantages of dispensing with an expensive stationary power are estimated." It is not probable that locks, such as are contemplated by Mr. Taylor, the inventor, occurred to Mr. Smith; as they embrace all the requisites he requires for an elevating power, with the additional and most important one of perfect safety. W. G.

### Undulating Railways.

Washington, D. C., March 30, 1835.

To the Editor of the Railroad Journal:

Dear Sir—Messrs. Badnall & Stephenson, in their views respecting Undulating Railroads, are both right and both wrong. Mr. Badnall's experiments prove, that in locating Railroads in this country, where they must necessarily be undulating, an effect of power may be had not differing materially from the effect had upon level railroads; and it becomes the duty of engineers, to whom this subject more particularly belongs, to give particular attention to it.—Mr. Stephenson's views are correct in favor of level railroads; but it is out of the question to have them level for any considerable length in this country, or any other. We must then consider the results of Mr. Bagnall's experiments as highly useful and important, inasmuch as they demonstrate that the useful effect upon a railroad over an undulating country may be nearly, if not quite equal, to the effect if the road were level. I belong to the craft whose duty it is to make these subjects their study, and if you do not greet me too roughly, may remind you occasionally of

Most respectfully, your

Friend.

We shall be pleased to receive further communications from a "Friend."

*Remarks and Calculations on the best form for Railway Bars, and on the defects which exist in the present method of supporting the same. By R. STEPHENSON, Engineer.*

(Concluded from our last number.)

I am afraid this digression from the point more immediately under discussion, may appear irrelevant, but it is one which I feel is necessary, fully and clearly to explain the views expressed in the foregoing remarks, respecting the flexibility of the rails above the supports, which I hold to be beneficial in more respects than one; for, whilst the strength of the rail is rendered greater in the middle of its length, the height of the chair, and the level of the rail, is reduced, which contributes to the steadiness of the construction.

Having learned that the elliptical rail on the Liverpool Railway had frequently broken, I wrote to Mr. John Dixon on the subject. The following is an extract from his letter:

"Our old rails, I am convinced, are too weak; not for the waggons, but for engines that bear six tons on one pair of wheels; and the weakest part is evidently the end next a joint, for although as deep at that point as at the places where the other chairs are fixed, it has not the support from the next rail, as if it were welded there, or were one continuous bar, especially when the joint chair gets loose on the block, key loose, and the block, or sleeper, itself settles. If fact, they generally bend, or break, within six or eight inches of the end of the rail. I believe the best rail for economising iron would be to make all the rail undulating as usual, but the two extremes parallel, the parallel part to be as deep as the belly of the undulations; but probably this could not easily be made, and would be then only a substitute for a little more iron."

This intelligence induced me to ascertain, by calculation, the weakest point in the Liverpool rail, and compare it with Mr. Dixon's statement. If the calculation accorded with the practice, it is clearly easy to provide against a similar imperfection.

In the accompanying drawing,\* figs. 1 and 2 are sections of the old Liverpool rail, weighing 35 lbs. per yard; figs. 3 and 4 are similar views of a proposed elliptical rail, to weigh 50 lbs. per yard. The relative strength of these two rails, at eight inches from the end, is as 6 to 15.3, or rather more than 1: 2½.

Such an increase of strength beyond those employed on the Liverpool and Manchester Railways, which were used for temporary purposes, and thereby injured, during the execution of the work, would appear to be ample.

If we apply the formula which has already been given for the strength of the rails, to the Liverpool elliptical rail, we shall find that it indicates the weakest point at about nine inches from the end, being, in fact, at that point of the curve where it deviates most from the true ellipse, which would have been equally strong throughout.

Now, the depth of the elliptical rail, at nine inches from the end, is exactly the depth due to a parallel rail of the same weight per yard. We have, therefore, data to calculate what would have been the strength of the parallel rail in the middle of its length, compared with the strength of the elliptical rail at that point, which

\* The drawing here referred to did not accompany the manuscript from Mr. Stephenson.

has been found insufficient for six tons upon a pair of wheels, as stated in Mr. Dixon's letter.

The depth of the Liverpool rail, at the point of fracture may be taken at 2½ inches: whereas the depth of a parallel rail of equal weight would be three inches; the relative strengths of the two rails, at the usual place of fracture, would be 2½<sup>3</sup>, 3<sup>3</sup>, or as 8½: 9, in favor of the parallel rail at this point.

Now, to continue the comparison, we must suppose the same load which broke the elliptical rail at seven inches from the end, transferred to the middle of the parallel rail, and calculate its adequacy under these conditions.

Since we find the elliptical rail break at seven or eight inches from the end, where the depth is 2½ inches, we are perhaps near the truth in taking three inches as the proper depth, being the depth of the parallel rail [which we have] just shown has the advantage over the other in the rate of 8½: 9.

We know also that the strain produced by the same weight, placed in different parts of a beam, is as the rectangle of the segments into which the beam is divided; the comparative strains, therefore, produced by a given weight, seven inches and eighteen inches from the end, will be as 7 + 29: 18<sup>2</sup>, or as 5: 8, very nearly.

Taking, therefore, the strength of the parallel rail as correct, at seven inches from the end, it must be too weak in the middle, in the proportion of 8 to 5; and we may, consequently, from these premises, draw the following conclusions, viz.: Had the Liverpool Railway been laid with parallel rails, 35 lbs. per yard, the breakage would have been increased in the ratio of nearly 5: 8, and the place of fracture would have been midway between the bearings, instead of seven or eight inches from the end. If we take the weakest part of the elliptical rail, as calculation gives it, viz.: nine, instead of seven inches, then the proportional breakage would have been as 6: 8.

I am fully aware that some risk is incurred in thus endeavoring to represent numerically a comparison which is perhaps not susceptible of rigid calculation; but I am anxious that the truth on this much disputed point should be elicited, and in this attempt to establish a comparison upon grounds partly experimental and partly theoretical, it is believed a numerical statement will tend to define that which I am not aware has hitherto been more than mere matter of opinion, and thus bring the subject more within the grasp of legitimate argument.

In concluding these remarks, I beg leave to state that, if I have in any part of them betrayed a bias in favor of the elliptical rail, without a sufficiently powerful reason, I shall have pleasure in hearing it pointed out, with a view to correction. I have endeavored sincerely to give the subject that impartial consideration which its importance demanded, and I need scarcely add

gave rise to those experiments have already been explained, and I am enabled, through the kindness of Mr. Wood, to add a copy of the report of the deputation from the Board of Directors of the Newcastle and Carlisle Railway, appointed to examine the subject by experiment. I also add copies of letters received from Mr. Wood and Mr. Storey.

#### COPY OF REPORT OF DEPUTATION ALLUDED TO ABOVE.

*Result of trials made at Walker Foundry, October 10th, and 31st, 1832, to show the comparative merits of Fish-bellied and Parallel Rails.*

"Various experiments were made, but those which appear to the committee to have more immediate reference to the views of the directors, are the following.

"Three trials were made of fish-bellied rails, of 50 lbs. per yard; three trials of parallel rails of the same weight; and two trials of fish-bellied rails, weighing 40 lbs. per yard.

"The weights laid on in these trials reached different amounts, but 90 cwt. is taken in the following for each trial, which the committee conceive to be a load sufficient to meet any practical object. The weight of the steelyard was 5 cwt., and 14 cwt. was added each time; the measure of deflexion was taken in parts, 1066 of which go to an inch.

"The first six loads (90 cwt.) on the three trials of 50 lbs. fish-bellied rails, measured 164½ parts of deflexion, which give an average of 9.14 parts as the mean advantage on each 14 cwt. loading.

"The first six loads (90 cwt.) on the three trials of 50 lbs. parallel rails, measured 230 parts of deflexion, or an average of 12.77 parts mean advance for each 14 cwt. loading.

"The first six loads (90 cwt.) on the two trials of 40 lbs. fish-bellied rails, measured 185 parts of deflexion, averaged 15.41 parts mean increase of each 14 cwt. loading.

"Rejecting fractional figures, the committee consider these results to show, under the circumstances stated, that a fish-bellied rail of 45 lbs. per yard is equal to a parallel rail of 50 lbs. per yard, because, as just expressed, nine parts represent the 50 lbs. fish-bellied rails, twelve parts the 50 lbs. parallel, and fifteen parts the 40 lbs. fish-bellied, bringing the parallel, as nearly as need be, midway between 50 lbs. and 40 lbs. fish-bellied rails."

(Signed,)

W. WOODS.

#### COPY OF A LETTER FROM MR. WOOD.

Killingworth, 24th May, 1834.

My dear Sir: As the information you required was the result of private experiments, I did not like to give it until I had the sanction of the directors, which I now have. The experiments were occasioned by a difference of opinion whether parallel or fish-bellied rails were best, and, to bring the question before the directors in the most decisive manner, experiments were ordered to be made upon both rails—Mr. B. Thompson furnishing the section of parallel, and the fish-bellied being furnished by myself. Enclosed are the sections, by which you will see that the wearing surface, or top, of the rail, and the base, were precisely the same; the extreme depth of the parallel

being 4 in., fish-bellied 5 in.; the base of the latter being a semi-ellipse,  $3\frac{1}{2}$  in. deep,  $1\frac{1}{2}$  in. from the end of each three feet, the curved knob being three inches. The experiments were conducted with the greatest care, and the deflexion measured in 1038th parts of an inch. The weights were added 14 cwt. at a time, upon 6 cwt., the weight of the steelyard.

Taking the first 96 cwt. laid upon the middle of the rail, the rail being supported at each end, the deflexion was  $\frac{1}{11}$  parts of an inch, fish-bellied;  $\frac{1}{11}$  parts of an inch, parallel, of 50 lbs. per yard each; and  $\frac{1}{11}$  parts of an inch 40 lbs. fish-bellied; although the conclusion came to by the directors was, that the parallel 50 lbs. was equal to the mean between the 50 and 40 lbs. fish-

bellied, viz.:  $\frac{55 + 98}{2} = 76\frac{1}{2}$  1; the comparative stiffness of 50 lbs. parallel and fish-bellied rails, was as 55 : 77.

As, however, the directors took every thing into consideration, the form of the two rails, the fact that the saving of material in fish-bellied being only in the keel of the rail, the conclusion that a 45 lbs. fish-bellied is equal to a 50 lbs. parallel, is, I believe, a just estimate of their comparative merits. We have found the circular knob an excellent form for securing a good material of iron, as it is difficult to form with the common iron. Any other information on the subject I shall be happy to give you. I am, my dear Sir, yours very truly,

(Signed,) NICH. WOOD.  
To ROBERT STEPHENSON, Esq.

EXTRACT FROM MR. STOREY'S LETTER.

St. Helen's, Auckland, May 31, 1834.  
Dear Sir: In reference to the subject of the form of rail best suited to railways. On the Stockton and Darlington Railway, you know we have only the fish-bellied kind, which form I have invariably supported, as the strongest, and best suited for railways, with the least weight of material in them, and liable to be the least affected by lateral blows, on account of the point of support being nearest the centre line of the mass of iron forming the rail.

One point is settled with me — that the better the quality of iron, the less it is suited for railway bars.

I have used rails made from Scrap No. 2 Mine Iron, with a Swede bar on the top; Cable Iron, manufactured into rails; No. 2 Mine Iron, do.; with none of which I am yet satisfied.

I have lately ordered 250 tons of rails (to replace our light ones) for the Stockton and Darlington Railway Company, to be manufactured in a different way; which, if I succeed in getting of the fish-bellied shape perfect, I am of opinion will be found to answer the purpose.

If I do not succeed in that shape (without faults and cracks on the under side) it is my intention to resort to the parallel rail, as of that shape there can be no doubt of its answering.

The process I have described is, that good strong mine iron is to be used, that has passed through the refinery and puddling furnaces, and reduced, under the forge hammer, from seven to five inches square, before rolling into rails. The price is only a shade higher than if manufactured from No. 2 mine iron bars; and 10s. per ton more than the parallel bar of the same quality and manufacture.

You will find that very heavy malleable iron rails are subject to rapid decomposition on the surface, until they attain the strength that passing weights will give motion to

the particles, when that decomposition will, in a great measure, cease; thereby proving my theory, that beyond a certain weight is a wasteful and useless expenditure. Dear Sir, yours always, truly,

(Signed,) THOMAS STOREY.  
To ROBERT STEPHENSON, Esq.

On the above report to the Directors of the Newcastle and Carlisle Railway, I have little to remark, except to explain the apparent discrepancy which would seem to exist, on comparing the results taken as the basis of the report, with those described by the table furnished to me by Mr. N. Wood. In the report, other trials were alluded to, with which the results are blended, so that the average is below those stated in the table. The other experiments were, I believe, varied by allowing the rails to be placed loosely on the supports, when the superiority of the elliptical rail, as regards stiffness, was not so decided. The table is founded on experiments, where the rail was firmly keyed into the chairs, and was, therefore, more nearly in the condition of a railway in perfect order. This, I apprehend, will account for the relative stiffness of the two rails being stated as 55 : 77, whereas calculation gives it 55 : 85, and, by the table, where the rail was firmly keyed to the supports, it is 55 : 91.

It is also necessary to explain that the elliptical rail was made with a circular projection, which fitted into a corresponding recess in the bottom of the chair, according to Mr. W. Losh's patent. This would render the keying more efficient, and add a little to the rigidity of the elliptical rail.

This may probably account for the stiffness by experiment sometimes exceeding that represented by calculation, which ought not to be the case where the form of the beam is reduced in depth towards the end. The comparative stiffness, however, taken from the average of the experiments, as stated in Mr. Wood's letter, viz. as 55 : 77, does not differ so much from 55 : 85, as to shake our confidence in the theoretical view affording means for a tolerably near approximation.

The relative ultimate strengths are not mentioned in the report, but from the table they may be found to be as 12 : 15, and calculation gives 12 : 16, which is again sufficiently near to show that the principles adopted in the calculations are correct.

In Mr. Storey's letter, he mentions, in a particular manner, the difficulties he has had with respect to the quality of the iron employed in making rails; and though he expresses it as his opinion, that "the better the quality of the iron, the less it is suitable for railway purposes," I am persuaded he intends this to be taken with great limitation, as it is evident he would not mean to convey the converse, viz.: that the worse the quality of the iron, the better it is suited for railway purposes.

Mr. Storey is not alone in the opinion that the railway iron should not be of the best quality; it is urged by many that iron of the best quality is liable to laminate more rapidly than iron of a poorer description. I cannot say that my experience has led me to this conclusion; yet there may be consistency in rejecting the use of the finest cable iron, as not forming a rail proportionally stronger with the increased expense. I think it not improbable that much of the evil complained of on the Darlington Railway, from the lamination and splitting of the rails, may be owing, in some degree, to the circumstances of the carriages being without springs, and some of the very heavy

locomotive engines with springs applied in such a manner, that they operate only to a partial extent.

On the Warrington and Newton, on the Leicester and Swannington, and on the Stanhope and Tyne, Railways, I recommended the rails to be made from best No. 2 bar iron, entirely free from cinder. The rails, when manufactured, are, therefore, No. 3 mine iron. This mode of manufacture would give rails of similar quality to those weighing 28 lbs. per yard, laid down on the Stockton and Darlington Railway in 1825, which, I was surprised to learn from the chairman, were in better condition now, after several years' wear, than some rails of 40 lbs. per yard, recently laid down.

[Journal of Franklin Institute.]

Report of Frederick C. Mills, Engineer, to the Honorable the Canal Commissioners of the State of New-York.

(Continued from number 12.)

In selecting a line having in it this amount of lockage, particular regard was had to the facilities offered for the equal and proper distribution of the locks.

Several routes were suggested, two of which were minutely surveyed; one through the deep cut at Col. Williams', down the Cashaquo valley, via Nunda, to the Dansville line near Mount Morris; the other following the same route for  $1\frac{1}{2}$  mile over an undulating surface, (with some extra cutting through points of ridges,) which continues of like character for about 4 miles, then passes on to a smooth faced country of clay soil on a rocky base, gently declining towards the river, over which the line was continued down the hill at Mount Morris to the junction with the aforesaid Dansville route, and is  $14\frac{1}{2}$  miles in length. Several examinations were made down the hill, which resulted in favor of the easterly line, a profile of which, together with one of the line down the ravine behind General Mill's house, will be found in the atlas, folio No. 17 $\frac{1}{2}$ .

In descending this hill, there is a fall of 469 feet in the distance of  $3\frac{3}{4}$  miles.

In locating the locks on this canal, I have endeavored in all cases to obtain a "pound reach" between them of sufficient length to fill a lock with water without depressing the level from which it is drawn more than six inches.\* To keep within the rule, and overcome so large an amount of lockage as will be concentrated in the above distance by single locks, would be exceedingly difficult, and although combined locks are considered objectionable, not only on account of the waste of water, but also from the loss of time occasioned when two boats arrive passing in opposite directions, the one arriving last being unavoidably detained until the first has passed all the locks forming the combination; yet in locations of rapid descent, and where the supply of water is abundant, it is deemed advantageous to construct combinations, inasmuch as there would be an important saving both in the expense of building the locks and in the diminution of the quantity of excavation and embankment necessary in forming the requisite "pound reach" for single locks; and there would also be a reduction in the number of lock-houses and tenders. I have therefore in the rapid descent to Mount Morris, located 11 combinations of 3 locks each, 6 combinations of 2 locks each, and 2 single locks. They are all 10 feet lift except the 2 single locks, one of which is 8

\* This requires that the distance between the locks should be as many chains as the lock below into which the water is drawn has lift in feet.

and the other 11 feet lift, equal in all to 469 feet.

The proper length of level is obtained throughout the line except in five cases, which occur at the above point. These vary from 11.10 to 13.35 chains in length; the required surface may however be added by widening the levels, for which liberal provision is made in the estimate.

There is one other combination. It is formed of 3 locks of 10 feet lift each, and occurs about  $7\frac{1}{2}$  miles above Portageville, in the descent of Round Flat, (so named from its peculiar shape.) For length of levels, lift of locks, total distance of each from Olean, and the names of proprietors through whose land the canal passes, see statement L.

This distance of  $17\frac{1}{2}$  miles is subdivided into 17 sections, on which are located 56 locks, (45 are combined,) 7 culverts, 12 waste-weirs, 24 road and 24 farm bridges. Estimated cost of construction \$536,767 14.

The Nunda valley route presents greater facilities for the distribution of locks, and as will be seen by reference to the profiles, (folio 26-27,) allows a distance of 14 miles to attain the elevation effected on the other line in  $3\frac{1}{2}$  miles; but the extra distance, several expensive ravines, and the deep cut (45 feet) through Nunda hill at Williams', render this route the most expensive.

It is  $15\frac{1}{2}$  miles long, and will cost \$559,733.73; \$202,391.45 more than the river line.

Several intelligent gentlemen were of opinion that a more favorable route might be found down Dish Mill creek to its confluence with the Genesee, and thence under the perpendicular river bank, partly in the bed of the stream, to Mount Morris dam. On passing over the ground, however, it was evident that the necessary protection required where the canal must be exposed to the river, would swell the cost far above that of either of the other routes, and as there would be no improvement in the location of the locks, the survey was abandoned.

#### MOUNT MORRIS TO ROCHESTER.

In making a cursory examination of this valley, the facilities for the construction of a canal appeared so nearly equal on each side of the river, that it was judged expedient to survey and locate two lines.

The estimates for both have been carefully made out, and the cost is herewith presented.

This portion of the Genesee valley has some peculiar features, which may be worthy of remark. The flats, which exceed in fertility and beauty any to be met with in this State, lie upon a bed of quicksand about 20 feet below the surface, and are generally from one to two miles wide, descending towards Rochester with great uniformity, at the rate of two feet to the mile. Through these flats the Genesee river takes a circuitous course, frequently mingling its waters with the quicksands below, and occasionally cutting the base of the hills which skirt the valley on either side.

#### West Side.

The route upon the west side of the river crosses the Genesee near Mount Morris dam by an aqueduct of 234 feet in length. Immediately below the mill-dam the rock disappears, and is not again seen until we arrive at the rapids near Rochester.

An aqueduct constructed at the point proposed must rest upon gravel, and probably quicksand, in which case piles will

be necessary for the security of the foundation. Thence over the Moscow flats to Tracy's store-house,  $4\frac{1}{2}$  miles, the line is very nearly straight, with the requisite cuttings, and of easy excavation.

Here the river washes the base of the hill; but by some extra cutting the canal may pass without requiring protection from the river.

From this point to Rochester the location is, with a few exceptions, on the flats near the upland slopes, and sufficiently elevated to be out of danger from the floods.

The base of the hill is washed by the river at 6 points, together measuring  $1\frac{1}{4}$  miles, 40 chains of which will require extra protection, which is provided for in the estimates.

Slide banks occur at two points; near Gardner's store-house 9 chains, and below Fowlerville bridge 36 chains, = 45 chains.

To guard against these slides will be difficult and expensive; though for the most part they may be secured by driving piles. Another mode (by which the principal slides would be avoided,) is to cut down the hill and pass into a ravine, as seen on sec. 81 of folio 21 in atlas. This will increase the expense, but add to the security of the work.

Dumplin hill is a high sandy point coming out of the river's bank near Tone's tavern,  $7\frac{1}{2}$  miles from Rochester. The first or river line encounters this hill. On further examination, however, a very favorable pass was discovered to the west of the ridge, through which the line may run, and avoid the river without increasing the distance.

On this side we pass Beard's, White, Dugan's, Allen's, Big and Little Black creeks. Allen's creek sends forth 3,386.40 cubic feet of water per minute, and is the only stream on which we can depend for a feeder. It may be received into the canal at Scottville with facility, and is  $12\frac{1}{2}$  miles from Rochester.

Connected with the Mount Morris dam is a canal about 3 miles long, running to the village and thence across the flats to the Canascraga, a little to the right of the Genesee road. This work was constructed by John R. Murray, of New-York, for hydraulic purposes; upon it are erected 1 saw-mill, 1 hemp factory, and a flour-mill with 4 run of stones.

The line from Olean and the Dansville side-cut come together at the foot of the hill under the village, and intersect the Morris canal at the flour-mill about 1 mile from the dam. In the event of continuing the route to Rochester on either side of the river, it may be necessary to make use of a portion of the mill canal for the purposes of a feeder, or as part of a main trunk; and in that case public security would demand that the State should assume the control of the water.

The dam appears to be well built; it is founded on rock, and by some additional protection at the ends, and enlargement of the embankment along the canal, and a new guard lock and pier at the pond, it may be used to advantage for the feeder, or as part of the main canal, in case it should be deemed advisable to cross the river in the pond, which, however, (unless there be peculiar circumstances connected with it calculated to recommend the plan,) should always be avoided. The rise here from extreme low to high water mark, is  $6\frac{1}{2}$  feet; and the pond is favorably situated for this mode of crossing.

A company have made arrangements for

constructing a bridge over the Genesee river at a convenient point, for the connection of a towing path; and that you may be able to form a just comparison of the merits of the two lines, I have made an estimate of both, and I find the cost of this to be \$3,588.03 less than the other.

#### EAST SIDE GENESSEE.

The route upon this side of the river crosses the Canascraga near Colonel Fitzhugh's, and by some extra cutting to avoid the river and a few deep ravines which occur, passes on to the end of section 78, three miles below Genesee, principally over grounds gently sloping towards the river, and in a very direct and favorable line. Here high lands intervene, and force us off to the left, over broken grounds, in a circuitous direction round by the river's bank, encountering the steep side hills above Fowlerville bridge, and requiring protection from the stream.

After passing the bridge we leave the river's bank and run on to Avon Springs, with a more favorable line, avoiding several serious slides by keeping up the level over the high grounds.

Gentlemen residing on the line were of opinion that a much shorter and cheaper route might be obtained, by running across the ridge past Hogmire's, on the uplands to Black creek, avoiding all the slides on the river above Fowlerville bridge. A survey was made, but finding the cutting would be 65 feet in the summit, the project was abandoned.

From Avon Springs to Rochester the location is less upon the upland slope, and with the exception of two points near Markham's, two below Scottsville road in Rush, one in Henrietta, and that near the feeder dam at Rochester, a not unfavorable line is obtained upon and near the river flats.

After passing the Canascraga, the canal crosses Fall brook, Jacocks' run, Black creek, Conesus outlet, Honeyoye, Massauga and Red creeks, all inconsiderable streams, except the Conesus and Honeyoye. These are the outlets of Conesus, Hemlock, Scaneitice, and Honeyoye lakes, and together send forward in the driest season 3,311.65 cubic feet of water in a minute.

These streams may be received into the canal as feeders, and their capacity may be very much increased by damming the lakes, and reserving the surplus waters for the dry season.

This plan to some extent, and for a limited period, was adopted some years since, with the view of supplying a portion of the Erie canal with water.

Ninety chains of slide banks occur on this line. They are very similar in character to those on the west side of the river, and require the like protection.

The Genesee river runs along the foot of the hill at fifteen places, together measuring 3 miles,  $1\frac{1}{4}$  miles of which require docking to protect the canal.

Dams and short feeders necessary to receive the Conesus and Honeyoye into the canal, are provided for in the estimate.

The descent to the Erie canal is 73 feet, having 9 lift locks, 3 aqueducts, 21 culverts, 7 waste-weirs, and 14 road, and 59 farm bridges.

The distance from Mount Morris to Rochester, on the east side of the river, is  $38\frac{1}{2}$  miles, and the canal is estimated to cost \$406,607.67.

The west side is  $87\frac{1}{2}$  miles long, having the same descent, with 9 locks, 5 aqueducts, 26 culverts, 11 waste-weirs, 28 road,

and 36 farm bridges: estimated cost, \$305,067.85.

DANSVILLE SIDE CUT.

The Canasraga valley, in which this canal is located, has all the characteristics of that of the Genesee below Mount Morris, and may be considered a continuation of it. The flats average about one and a half miles in width, and extend to the village of Dansville, 45 miles from Rochester, by the road, and 52 $\frac{1}{4}$  miles, by the contemplated canal.

Opposite this place, and above McWhorter's mill, is the confluence of Great and Little Mill creeks with the Canasraga. I gauged these streams in October last, during a severe drought. Great Mill creek then furnished 867 cubic feet, and the Canasraga, below its junction with the above streams, 2,458 cubic feet, in a minute. They have a rapid descent to this point, affording valuable water privileges. In the vicinity of the village are four establishments for the manufacture of paper, each having a double engine; also 4 or 5 grist mills, 1 clover mill, 1 blast furnace, 2 trip hammers, and several tanneries.

The paper mills employ 84 persons, manufacturing about 80,000 dollars worth of paper annually. The clover mill has prepared for market 1,500 bushels of clover seed in one season.

South of the village the land abounds with pine timber, of a quality not inferior to any in this section of the country, and within the circle of a few miles there are 55 saw-mills, making large quantities of lumber, the principal part of which would be conveyed to market by this canal. The soil in the vicinity of the village is alluvial flats and superior bottom lands. The principal part of the valley, as well as the uplands, is fine quality wheat land. Sparta, (in which the village is located,) is the largest town in the county. In 1830 the population was 3,777: it is now estimated to contain 4,500.

In terminating at the village, the supply of water for 2 $\frac{1}{2}$  miles of the canal, in which are 11 locks, must necessarily be drawn wholly from Mill creek at Dr. Falkner's dam, which will divert the water from his paper factory, diminish the supply at McWhorter's grist-mill, and at the mills belonging to John Wood & Co.

The line crosses the Canasraga by an aqueduct near the dam and head-race conducting the water to Wood's mills, and thence on to Mount Morris, upon the west side of the creek, over grounds unusually favorable for the construction of a canal. John Wood & Co. have in operation one carding and fulling mill, one saw-mill and a grist-mill, with 2 run of stones, designed for 4. Suitable stone for the mechanical work is found near these mills, and in the vicinity of Dansville.

The total descent from the village is 126 feet, and the distance from the head of the feeder at Faulkner's dam to Mount Morris, 15 $\frac{1}{2}$  miles. It is divided into 15 sections, in which are 15 locks, 1 aqueduct, 7 culverts, 4 waste-weirs, 8 road and 23 farm bridges, making a total cost of \$156,604.25.

In the above estimate, I have provided for a dam and feeder immediately below Wood's mills.

By adopting this plan, we shall be able to take the requisite quantity of water to supply the loss occasioned by filtration and evaporation of 12 $\frac{1}{2}$  miles of the canal below all the mills of much value on the stream, which will materially reduce the damages that would otherwise be sustained.

I have also made an estimate for a ter-

mination at McWhorter's mill, about one mile from the village of Dansville. This will reduce the whole distance 1 mile; the lockage 46 feet, and diminish the expense \$30,079.73.

In computing these estimates, frequent reference was had to the copious field-notes and observations made on the ground, and while on the one hand I have been careful not to swell the amount to an extravagant degree, so on the other hand, I have endeavored to make it amply sufficient for the construction of the work in a permanent manner.

I will add also, that the line has been carefully located, and to show the character of the excavation, shafts were frequently sunk, and particularly at points where there were any indications of a change.

The soil generally, is easy to excavate, and I think better calculated for the retention of water than any other hundred miles of canal I have ever examined.

With few exceptions, the embankments may be rendered sufficiently impervious to water by a careful assortment of the materials, keeping the firmer and more tenacious in the front of the work: yet the scarcity of water on the summit, and the unavoidable expense of procuring the requisite supply, have induced me to make provisions for guarding against waste by leakage, in all cases where the soil exhibited indications of a porous character. Liberal allowance has accordingly been made in the estimates for lining, as will be seen by the annexed reports, containing a detailed description of the character and amount of the different kinds of work.

The estimates for excavation and embankments are made upon the plan of allowing the banks a slope of two feet horizontal base, to one foot vertical on the inside of the canal, and one and a half feet horizontal to one foot vertical on the outside; the towing-path bank to be 12 and the berm bank 8 feet wide on top, and 7 feet high; the canal to be 26 feet wide on bottom, and 42 feet at the surface, with four feet depth of water. The side-cut to Dansville, the Ischua creek, and the Genesee river feeders at Ketchum's and at Mt. Morris, and also Allen's creek feeder at Scottsville, have the same dimensions as the main canal, being designed for the purposes of navigation. All the other channels intended for supplying the canal with water, to be 16 feet wide, with banks of the same form and size as the canal, except the width on top, which is 7 feet.

In many cases, it has been necessary to make provisions in the estimates, (as may be seen by reference thereto,) for protecting the banks of the canal from the encroachment of the streams. Wherever stone could be procured with facility, and the foundation was such as would ensure the permanency of the work, the estimates have been made with the view of erecting permanent stone walls on the exterior of the banks. With a single exception, this is the case at all the points exposed to the abrasion of the streams from Olean to Mount Morris, embracing two-thirds of the whole distance requiring protection.

On the Genesee river, below Mount Morris, docking has been estimated for, in place of stone wall, on account of the scarcity of stone, and the general prevalence of quicksands in the bed of the river. The first cost would be less than that of a stone wall, but it is believed the latter would be the cheaper in the end, inasmuch as the interest on the difference in the expense will not pay for the repairs of the former.

On canals located in valleys of much

depth below the summit of the surrounding uplands, and at the foot of steep side hills, the embankments and other works are often in jeopardy, and frequently sustain great injury from the sudden swelling of the streams in the time of freshest. The Rochester and Olean canal is not greatly exposed to these torrents; yet a portion of this route is so situated, and to avoid these difficulties, (so far as practicable,) I have availed myself of every opportunity presented by the locality, for passing the flood waters under the canal by culverts and aqueducts.

Waste-weirs have also been estimated fully adequate to draw off the surplus accumulation of water in the canal.

The plans adopted for the mechanical work on the canal are generally of the same character as those on the Chenango canal.

The variation which occurs in the estimates of the several structures is partly owing to the difference in the cost of procuring the materials and partly to the quantity used.

The culverts are to be made of stone masonry laid in hydraulic cement, as are the aqueducts, except those where the streams are too near the bottom of the canal to allow space for turning the requisite arches. In such cases, wooden trunks are substituted on stone abutments and piers.

The abutments for bridges are of stone masonry, laid in quicklime mortar, at 50 feet apart, upon which a strong truss bridge is laid.

The bridges for roads much travelled are 22 feet wide. Other road and farm bridges 12 feet wide.

The plan for waste-weirs generally has stone abutments to sustain the earth, with a timber gate-way, and where the ground is favorably situated, it is designed to add long wates, by a depression in the top of the bank paved with stone.

I have made estimates, in detail, for two plans of locks, with chambers 90 feet long and 15 feet wide: one for a composite lock of wood and stone, like those now being built on the Chenango canal—and the other, for a lock of stone masonry, wholly laid in hydraulic cement. The quoin and coping to be cut stone; all the other masonry to be substantial and smoothly hammered work.

The composite lock from head to 8 feet below upper gates to be of stone masonry laid in cement—the remainder, a dry wall with a wooden chamber made within, bolted to and supported by the masonry. The plans for the foundation and gates are the same in both locks.

For a detailed estimate of the

locks,	see statements A and B
culverts,	" C
wood trunk aqueducts,	" D
stone aqueducts,	" C
bridges,	" F
waste-weirs,	" G

Drawings of each plan of locks and of the aqueducts, bridges, culverts, &c., will be found at folios 32, 33, 34 and 35 of the Atlas.

There is a difference in the expense of the same kind of structure, occasioned by the location and by the greater facility of obtaining materials in some cases than in others. The statements here referred to, however, are calculated from medium cases, and are designed to show the average cost.

(To be continued.)

[From the Journal of the Franklin Institute.]

*American Patents issued in August, 1834.*

(Continued from our last number.)

36. For an improvement in instruments for Cutting and Crumbling the Stone in the Bladder; James Lee Hannah, M. D., city of New-York, August 19. These instruments for cutting and for crushing the stone, are, when closed, in the form of a sound or catheter, but considerably curved at the end which is to enter the bladder. According to the drawing, the shaft is straight, but the end is bent round so as to form a quarter of a circle of about three fourths of an inch radius. This quadrant constitutes the jaws by which the cutting and crushing are to be effected; these jaws work on a pin near the extreme end, and when closed form a round smooth body, having no projection to obstruct it in its entrance; its opening commences at the point where the curve terminates and joins the straight shaft. This straight shaft consists exteriorly of a thin silver tube, and through this tube passes a steel spring like a watch spring, which, when pushed in, allows the jaws to open, the spring being attached to the jointed piece. The cutting instrument has edges like shears, the crusher opens like forceps, and has teeth to hold and crush the particles of stone which have been divided by the cutter.

37. For a Machine for Grinding Grain; Joseph Grant, Providence, county of Providence, Rhode Island, August 19. This is to be a cast iron mill, consisting of three cylinders and a concave, all of which are to be so fluted as to form teeth not more than a quarter of an inch wide, and an eighth of an inch deep. Two of the cylinders, with a hopper above them, are to be placed horizontally and parallel to each other. The lower cylinder has a concave under it, which is adjustable by means of a screw. The cylinders are all to move with different velocities, the last with the greatest speed.

38. For a Threshing Machine; Chas. Wilson, city of New-York, August 19. This machine is to have a frame made entirely of cast iron, and the concave is to be formed entirely of triangular cast iron bars, about five eighths of an inch thick, and an inch apart, allowing space for the grain to fall through between der is also to be of cast iron, consisting them. The whole surface of the cylinder of bands or hoops, four or five inches wide, and a quarter of an inch thick, with projecting pieces for beaters cast on them. These bands are to be driven on to a wooden cylinder.

39. For an improvement in the Percussion Cannon Lock; Enoch Hidden, city of New-York, August 20.

40. For a Filtering Machine; Isaac Wiseman, city of New-York, an alien, who has resided two years in the United States, August 20. The principal difference between this and the filtering vessels ordinarily employed, consists, first in there being a separate vessel to receive the water which has been filtered, and which vessel can, therefore, be removed for the purpose of clearing it of the sedi-

ment which always finds its way into such reservoirs; and, secondly, in interposing between the layers of broken quartz, sand, charcoal, &c., perforated plates of earthen ware, metal, or other substances, which will prevent their mixing with each other from agitation in removal from place to place. Such perforated plates are not new.

41. For a Revolving Turning Steel; Benjamin E. Hoyt, Ipswich, Essex county, Massachusetts, August 20. This steel is for turning the edges of curriers', or other knives, by passing a roller instead of a burnisher over them.

42. For an improvement in the manufacture of Percussion Powder; Samuel Guthrie, Sacket's Harbor, Jefferson county, New-York, August 21.

43. For a machine for Separating Gold from the Soil; John Dobson, Burke county, North Carolina, August 21. This machine has an inclined rocker, similar to that used in many others, and various appendages which have no claim to novelty. After describing these, the patentee says: "although I have been particular in describing the construction of the above machine, yet I rest my claim only on those principles of the bucket or receiver, by which a peculiar rolling motion is given to the mercury, most applicable to the collection of the gold; which principles and advantages it may be necessary to mention as understood by me. In the first place, a larger quantity of mercury can be used than by the present mode, without danger of loss, and extending from side to side of the bucket, presenting a rolling edge to the approach of the gold, of sixteen inches in length.

44. For a Clover and Herdgrass Hulling Machine; Reuben Ranger, Wilton, Kennebeck county, Maine, August 21. The hulling is to be effected by rubbing the seeds between perforated plates of sheet iron, one portion of which is a conical body, and is made to revolve upon a shaft placed horizontally; this is surrounded by a concave similar in form, and surmounted by a hopper. The rubbed seeds pass out through an opening in one end of the machine, at the lower edge of the base of the cone.

45. For an improvement in Finishing Leghorn, Straw, Grass, and Palm Leaf Hats and Bonnets; Joseph Snyder, city of Philadelphia, August 22. The hats and bonnets are to be varnished with any of the known suitable varnishes, adapted to the color of the article.

"The object intended to be attained by the foregoing improvement is to preserve hats and bonnets from moisture, that they may retain their proper shape."

46. For an improvement in the Spinning of Rope and other Yarn; Sidney D. Whitlock, Brooklyn, Kings county, New-York, August 22. It is observed in the petition, that this patent is claimed for a "new application of the machine for which letters patent of the United States were granted to a certain Robert Graves of Boston, on the first day of April, 1819."

In the specification it is stated, that the

original machine is modified by the use of a double railway for the machine, or machines, to run upon; using at each end of the double track, a detached section of the track, made to revolve like the turnabouts upon railroads, so as to accommodate the equalizing machine. "Each track is furnished with an endless band and rope, operating as described in the specification of the said Graves' machine herein referred to, alternately on the equalizing machines as they change tracks."

47. For an improvement in Shearing Machines for Shearing Woollen Cloth; Reuben Daniels, Woodstock, Windham county, Vermont. First patented May 13th, 1834. Patent surrendered and re-issued on an amended specification, August 22.

48. For improvements in the Power Printing Press; Otis Tufts, Boston, Massachusetts, August 22. We are informed in this specification, that "the principal difference between this power press and others now in use consists in supplying it with paper to be printed from one side of the frame, by using two friskets, one of which is under the operation of an impression from the platten, while the sheet of paper last printed is being removed from the second frisket, and another sheet is applied. As soon as the frisket first mentioned has received an imprint from the types, it is withdrawn by the operation of the machinery from between the platten and form, and the second frisket caused to pass in between the platten and frame, there to be acted on in its turn. So in succession each passes out from between the platten and frame with its printed sheet, while the other, with the sheet to be printed, is made to pass in between the platten and frame."

49. For a Double Cylinder Truck, for Raising Stone, Timber, &c.; Simon Frieze, Waterloo, Anne Arundel county, Maryland, August 23.

This truck is to run up an inclined plane or railway formed of parallel timbers, rising at any angle not exceeding thirty degrees. Instead of four wheels, there are to be two rollers turning on gudgeons, one at each end of the truck. An offset is to be turned down at each end of the rollers, to form a shoulder, or flanch, to keep them in their places on the ways. The part turned down is to be champhered, to cause the truck to keep the track the more readily. At the upper end of the inclined plane there is to be a block with a rope passing over its sheave, one end of which rope is attached to the truck, and the other drawn by horses or other animals, to raise the load.

50. For a Machine for Hulling Clover and other small Seeds; Merit Bailly, Attleborough, Bucks county, Pennsylvania, August 23.

51. For a Horse Power; Joseph B. Streeter, Middlesex, Yates county, New-York, August 26.

52. For Jointing and Manufacturing Staves for Barrels, &c.; Cyrus M'Gre-

gor, Newport, Sullivan county, New-Hampshire, August 26.

53. For an improvement in the surgical instrument called a Scarificator; Geo. Tiemann, city of New-York, August 26. The improvement in the construction of the scarificator, which forms the subject of this patent, appears to us to deserve the appellation, as we think that, both in construction and in operation, it will be found superior to those made either in the English or the German manner. The patentee, after describing the usual mode of forming this instrument, informs us, that the principal improvements made by him are the use of pointed lancets, instead of those with rounded ends; a contrivance for using them with more exactness, and so as to cause less pain, and produce a more profuse bleeding than heretofore, whilst the mechanism is more compact, and more easily kept clean, and in order, than in the old instrument.

The lancets, instead of standing in rows upon an axis, or shaft, are all fixed upon a flat plate, which fits into a box, similar to those now in use, but smaller. For the purpose of moving the plates containing the lancets, an axis and jointed levers are placed under it, which are operated upon by suitable springs, and other appendages, that are fully described, and perfectly represented in the drawing. There is no distinct claim made, but the difference between this and other instruments for the same purpose is clearly designated, so as to leave no doubt whatever respecting the points upon which the dependence for originality is placed.

54. For Stoves for Burning Coal; Abial Smith, North Providence, Providence county, Rhode Island, August 27.

55. For a Threshing Machine; John Matthias, Manchester, Baltimore county, Maryland, August 27.

56. For a Bedstead for the Sick; Wm. Woolley, city of New-York, August 30. [For a description, with drawings, see p. 74, vol. iv., of *Mechanics' Magazine*.]

The following remarks of Mr. Green apply with equal force to many other branches of mechanics in this country. We certainly have the talents and the enterprize, and only want patronage from those who now go abroad for their articles.

[From the *American Journal of Science and Arts*.]  
*On the construction of the Barometer, and other Philosophical Instruments, in this country.* By JAMES GREEN, Philosophical Instrument Maker in Baltimore.

To Professor Silliman:

Dear Sir,—Early after the publication of No. 1, Vol. XXVII., of your very valuable Journal, my attention was directed to an article on the construction of the Barometer; and, although interested in all improvements of the means of making philosophical observations, I felt particularly so in the present instance, from having received an order on account of the public service to construct a Barometer that would furnish accurate indi-

cations of atmospheric pressure, on any plan which my experience in this branch of manufacture might approve.

In perusing the article, I was particularly attracted by the coincidence which existed in the construction of some parts of Mr. Durant's instrument, and a modification of Gay Lussac's Barometer by M. Buntén, a favorable report of which was read before the French Institute, by Messrs. Savart and Arago, and which subsequently received a favorable notice from Baron Humboldt, who, after having used the instrument during a travel through Germany of several months, testified to its efficiency in preventing the admission of air into the mercurial column. The *Globe Portable Barometer* of Mr. Durant seems to present all the advantages derivable from that arrangement, with some additional securities. However, I must freely confess that the gratification which a Philosophical Instrument Maker might be presumed to derive from such a circumstance, was in some measure diminished by discovering the writer to be under the impression that there existed an indifference to all efforts at the perfection of so important an instrument as the Barometer, on the part of the manufacturer, who, I hope, may be often found both "willing and able" to resort to all the precautionary means necessary to insure as perfect an instrument as practicable, when such an instrument is wanted. In so far as the accuracy of the instrument may depend upon the boiling of the mercury in his tube, it is a very common thing with him to take the "patient care" required in this operation. Indeed, it has been my uniform practice to observe this precaution in all instances where such accuracy was desirable, and also to use mercury that had been redistilled.

I have been induced to state these facts, because, from the tone of the article alluded to, an individual who might desire a perfect instrument would be brought naturally to the inference, that in as much as good Barometers are constantly being made somewhere, if he cannot obtain one here, he can do so abroad.

I do not suppose, however, that either yourself or the writer would wish to increase the already unfavorable prepossession which to some extent exists, to the prejudice of the instrument makers of this country. They labor, it is true, under disadvantages in the manufacture of some parts of a philosophical apparatus, which are not experienced elsewhere. But the Barometer does not belong to this class. In its construction nothing is wanting but a proper knowledge of the principles it involves, and that facility of manipulation which experience usually yields.

On visiting London and Paris in the years 1830 and '31, for the purpose of availing myself of the great advantages which those cities afford for improvement in mechanical skill, as well as the collation of philosophical facts, and while there, being engaged in some experimental observations on the construction of

the Pyrometer, I had frequent intercourse with one of the most deservedly distinguished instrument makers of the former city, who I found entertained a more favorable opinion of the extent of the demand for good instruments in the United States than my experience authorized; that opinion doubtless arises from the frequent orders he received to furnish such for this country. It may be proper to remark, that many of these were of a character, that could have been readily furnished here, had there existed that confidence which many of our own workmen are entitled to receive.

Conceding, however, the imperfections of the ordinarily manufactured Barometer, I cannot join with the writer in attributing to this circumstance mainly the existing neglect of so useful an instrument, when used as a weather glass; but would rather refer it to the *lengthened series* of observations it is necessary to make in every particular place, before such satisfactory general rules can be deduced as will enable us to infer from specific movements in the barometric column definite changes of weather, few persons being found willing to make periodically precise observations.

In conclusion, I may be allowed to remark, that in view of the advancement of meteorological science, the want of uniformity both in the principle and construction of the various instruments used throughout this extensive country, in order to furnish correct meteorological tables, is certainly to be regretted, and any plan that could be suggested, which might obviate this difficulty, by establishing such uniformity, would doubtless materially enhance the value of these records in promoting the advancement of Natural Science.

Baltimore, Oct. 10th, 1834.

**EFFECTS OF LIME ON FISH.**—As a barge laden with lime was proceeding up the Ouse, from Lewes, from some cause or other, it sunk near Barcombe. The effect on the fish in the river was instantly manifested. Hundreds rose to the surface, and a great number were taken by hand. Pike were seen darting about in great agony; and most of the finny tribe within a mile of the spot where the accident occurred were rendered blind, from the burning nature of the lime. It is calculated that some thousands of fish perished.—[*Scientific Tracts*.]

**AN AID TO LEARNING.**—In the royal printing office of Paris, there are types of *fifty-six oriental alphabets*, comprehending all the known characters of the languages of Asia, ancient as well as modern; and sixteen alphabets of those of European nations, who do not employ the Roman letters. There are forty-six fonts of various forms and sizes. All the presses in the establishment are able to throw off 278,000 sheets a day, equal to 9,266 volumes 8vo, of 30 sheets each. The number of printers engaged in the office is three hundred and fifty.—[*Ib.*]

**TRANSPORTATION ON RAILROADS.**—We earnestly invite the attention of the public to the fact stated in the following extract from a Philadelphia paper:

"On Wednesday, last week, a train of 38 cars laden almost exclusively with dry goods, for the far West, left this city, on the Columbia Railroad. We learn from the Collector, that the goods carried by this train, weighed 114,884 lbs. (nearly 58 tons.) After the 6th of April, there will be 3 locomotive engines, running between this city and Columbia, daily."

On this road there are not only two inclined planes, but also grades of ascent constantly passed with locomotive engines, at a rate of acclivity equal to 45 feet in the mile. And yet emigrants who have been sent from Albany to our city, to dissuade our capitalists from subscribing to the stock of the New York and Erie Railroad, venture to assert, that a railroad exceeding in acclivity twenty feet to the mile, cannot be advantageously used for the transportation of merchandise.

Of the 403 miles of the Erie Railroad, upwards of 416 miles have grades of ascent less than 40 feet to the mile, 54 miles are on a dead level, and 160 miles are at rates less than 10 feet to the mile. Can the intelligent citizens of this metropolis, in the face of these and other important facts, be induced to listen to the assertions of men who have neither the patriotism to aid the work, by loaning the credit of the State upon undoubted security; nor the liberality to leave the company to make it at their own risk?

For our part we believe that the company's subscription books will soon put at rest all doubts upon this subject.

**Great Improvement on Railways.**—The Baltimore Gazette says: "We noticed in December last the successful attempt to pass a Locomotive steam engine, by its own power, with a moderate load attached to it, over the inclined planes at Parr's Ridge, on the Baltimore and Ohio Railroad; one of which has an acclivity of about two hundred and sixty feet in a mile. Since that time, the successful running of the Locomotive Engine, during a season well adapted to furnish full opportunity to test all kinds of difficulties, that might be caused by the weather—has resulted in the satisfactory and entire conviction, that Locomotive steam Engines can be constructed, on the plan adopted and now pursued, at the Manufacturing of Machinery of the Baltimore and Ohio Railroad Company in this city, each of which engines, with the use of anthracite coal as fuel, will be capable of transporting, with certainty and safety, one hundred passengers with the requisite cars to contain them, up an inclined plane ascending one hundred feet in the mile, at the rate of ten miles an hour. This triumphant and highly important result furnishes additional evidence, in this age of wonderful discoveries, of what may be accomplished by the use of steam power—the extent of which it is almost impossible even to imagine—as every month, every week, brings to view, and into practical use, some new benefit conferred on man by the aid of this powerful agent.

The obvious benefits, and they may truly be said to be immense in their extent—which will be derived from the result thus ascertained, are great reduction in the expense of graduating the road beds on most routes for railways, which in countries even moderately undulating, will probably be at least fifty per cent—and great increase of practicable routes for the location of railways capable of being used beneficially without the aid of stationary power. It is now believed to be not merely probable, but in fact beyond a reasonable doubt, that a route will be found on examination, for the continuance of the Baltimore and Ohio Railroad to the Ohio river, free from all inclined planes that may not be passed over without the aid of stationary power. It is also not less confidently believed, that

passengers can be conveyed the whole distance in each direction in twenty-four hours."

The application of steam power, to Railroads is still in its infancy.

**To the Editor of the New York American:**

I find, Sir, in the *Buffalo Whig* of the 1st April, the following notice of the defeat of bill to aid in the construction of the New York and Erie Railroad:

The application to our Legislature for a loan to construct the chartered Railroad through the Southern tier of counties from Hudson to Lake Erie, was rejected in the assembly, on the 30th ult., by a vote of 61 to 45.

This result, we see by the *New York American*, is taken very much to heart, by those who had looked for a different result. We wish, ourselves, the bill had taken a different course. The project of this road was clear as one, the carrying out of which would be of highest importance to the city of New York. It might have been well then—namely, as the Common Council of New York had seen fit to take some action upon the subject, that it had passed the bill, so amended as to authorize Corporation of New York to raise, by loan, one million of the city, the two millions required and loan it to the company.

But the truth is the plan is of no value in it—the road not worth the making. *Benjamin Wright's Report* of the survey of that Road conclusive on this point. This it is which killed all the confidence that ever was in the scheme. We deny not to the many valuable men in New York engaged in this undertaking, genius and sound discretion in those matters which pertain to their pursuits, there; but this does not fit them for every thing. They talk of using the Road if constructed, in winter! Was it because an Omnibus can traverse Wall street all the year? They should know, and should reflect that winter snows fall deep, in the mountains at that route; and that the Rail, if laid, where winds round the sharp acclivities of these mountains, "upon curves of no more than five hundred feet radius," would often be buried beneath shaggy less drifts, while at others the ice would form above the surface. Then the route, too, is long from New York to Dunkirk than by way of Albany and Buffalo, to say nothing of the ups and downs of one hundred feet to the mile! No; the scheme of a Rail-road, by that route, is visionary one; useless to New York, if made, useless to the country through which it would pass—useless to the west. Mr. Wright has put the seal of condemnation upon the thing so that nothing seems likely to remove it; and gentlemen should look at the subject as if it were a question of science, controllable, of course, by the known laws of traction and gravity, and subject to the known action of the elements. Viewed in this light it shows itself not dependent upon the votes of a Legislative body; it is condemned by physical laws, which legislative enactments cannot remove. A Rail-road from Albany to Buffalo could be used more months in the year, and with the Hudson would convey property quicker to New York, than the proposed road if made.

If gentlemen in New York, or elsewhere, will look calmly at this question, and compare it with mathematical demonstration, instead of flying out into "hot and furious condemnation" of us, for these remarks, they will arrive at the same conclusions to which our inquiries have brought us in the matter.

Even if it were true, which is not admitted, that the road could not be used in winter, its opponents will hardly pretend that it will be obstructed by snow and ice until June—or even until May—or indeed, until the 1st of April—and perhaps they will admit that it would be obstructed only for a few weeks, or just long enough to say that there is not a continued intercourse.

The following reference to the subject, from the *Pittsburg Gazette*, shows conclusively the importance of the work to this city, and to the Southern counties: What is most surprising to

me is, that all works which do not pass through Albany, Syracuse and Buffalo, are impracticable—"of no value in themselves,"—and "not worth making."

**OLEAN AND BUFFALO.**—Having had some curiosity to know at what time navigation of the Allegheny river from Olean to Pittsburgh usually commences in the spring, we yesterday called on Mr. Joseph Welsh, who keeps the tavern at which many persons from that country stop, to get information on that point. In reply to our question, he furnished us the following statement, taken from his books. The first arrival from Olean was, in 1831, on the 30th of March.

1832,	"	15th	"
1833,	"	31st	"
1834,	"	20th	"

We believe that the harbor at Buffalo is not usually open before about the first of May, or possibly not earlier than the 24th of April. So that New York would have an outlet to the Ohio, by the way of Olean, at least one month earlier than by Buffalo. In that time a steamboat could run from Olean to St. Louis, discharge and receive cargo there, and return to Olean.

The dates above mentioned are the times when steamers arrived at Pittsburgh from Olean, so that they must have left the latter place five or six days earlier. This statement of fact exhibits the importance of the Rochester and Olean Canal, and the Erie Railroad in a strong light.—[*Pittsburg Gazette*.]

Since writing the above paragraph, we noticed in the Legislature of New York have rejected the bill in relation to the New York and Erie Railroad.

The neglect to make this road will deprive the city of New York of some of the advantages which it might enjoy by the navigation of the Allegheny from Olean.

The New York Canal, not usually being open before the 15th of April, that is, about three weeks later than the average time of the opening of the Allegheny river from Olean. The Railroad, being available earlier, would be adopted to deliver merchandise at Olean, until the Canal would be opened.

If *Benjamin Wright's* report is conclusive on this point, "that it is not worth making and of no value in itself" it is also conclusive on another point—as the Editor of the *Whig* will learn, viz., that the road, when made, will operate as a machine by which business men may clear the ice in Buffalo harbor—although it may be somewhat difficult for them to clear the harbor of ice—before the first of May.

The correspondent of the Philadelphia Enquirer writes that the bill reported from a select committee, Mr. Heston, entitled "an act to improve the route by Railroads and Canals," passed the House Representatives, by a vote of 47 to 45.

**CHESAPEAKE AND OHIO CANAL.**—We learn from the *Williamsport Banner* of Saturday, that water was let into the Canal below that place the 1st inst., and it was expected that in a few days the Canal would be navigable the whole distance from Dam No. 5, above Williamsport, to Washington City, (about 110 miles.)—The *Banner* says: the basin, at the foot of Potomac street, has been, for upwards of a week, crowded with boats, arks, &c. laden with flour and flour, and that the busy, bustling appearance which the arrival of the boats has given that part of the town, in the vicinity of the wharves of a commercial city. No breach occurred in the Canal, either above or below that town, since the admission of the water. That part of the work spoken of above is, and the water has now been let into it for the first time. It is highly creditable to the execution of its construction that it has stood the test of the first admission of the water, although hardly to be expected that it can stand the rough operation so far as to remain strong or free from leaks before the work becomes fully settled by use.—[*New York*.]

*The first arrival at Cleveland.*—The Cleveland (O.) Herald of the 21st ult. says,—"The schr. John Q. Adams arrived at this port from Sandusky last evening. She reports that the navigation between the two places was unobstructed. The Atlantic which, she spoke on her passage down, is hourly expected. The John Q. Adams is the first vessel which has arrived this season."

*Lake Ontario.*—The navigation of this lake may be said to have commenced for the season. A schr. arrived at Oswego, from Toronto, on the 31st ult. Both harbors are free from ice, as are also Port Dalhousie, at the mouth of the Welland canal, and the canal itself as far as St. Catharines. The Oswego Palladium of the 1st inst. says that several schrs. were ready for sea, and would sail on that day; and that that port has never exhibited so great a promise of business so early in the season.—[Argus.]

The first engine has been placed on the London and Greenwich Railway, preparatory to the Easter fair; about 30 dollars per day has been received for penny passengers alone by the foot-path to Greenwich.

A novel machine was a few days ago exhibited in the Kennington and Clapham roads. It consisted of a sort of carriage-wheel which carries a *Railroad* for itself, upon which the carriage travels with great facility and quickness.—It was composed of a jointed square instead of a circle, and has four rollers, not touching the road, and four feet which alternately come to the ground, producing a kind of walking and escaping obstacles. We understand it is the invention of Lewis Gompertz, Esq. Should these machines be adopted, probably common Railroads may be partially or wholly dispensed with.

[From the New-England Farmer.]

COLD WEATHER.

[Continued from page 192.]

I have said that the air being heavier and more dense in valleys is capable of containing more cold and frost. And I frankly confess I am somewhat a heretic with respect to the theory that cold or frost is a mere negative of heat. From a long course of observation on the effects of frost on the various phenomena connected with it, I have been led to the opinion that frost is something positive, something material, capable of attracting and being attracted. And I think the various phenomena of frost are more easily and satisfactorily explained by this hypothesis than on the other.

I know that air, being a conductor of heat, will sometimes when rapidly applied to a substance conduct off the heat, so as to produce frost. But this does not prove that frost is not material. It only proves that when the heat, the antagonist principle of frost, is drawing off, frost as a substance makes its appearance.

In the spring and fall, when we are afraid, from the coldness of the day, that there will be frost, if a brisk breeze springs up towards night or in the evening, our fears cease, and no frost ensues.

Every person, who makes much observation respecting the effects of frost, knows that in the fall, when cold weather commences, that in a field of potatoes, a slight breeze of air will protect the hills a little elevated above the others, while those hills not more than three feet from them, and depressed six inches below them, so that they cannot feel the influence of the breeze, are much injured—the higher hills breaking the force of the breeze upon the lower.

Every person in Vermont knows that the frost falls later in the spring, and earlier in the fall, in the valleys than on the hills, unless there be a fog in the valleys to prevent it. And there is almost always less motion

in the air in the valleys than on the high lands. Why in these cases should not the brisk air on the hills conduct off the heat so as to prevent frost, while it lights on the lower ground, when there is scarce any motion in the air.

I will mention one more fact in connexion with this subject. Some years since I saw in the paper that a person hung a pail of water on a favorite fruit tree, while in blossom, to protect it from frost. At the time, I supposed that if it could have any effect it must be by creating a miniature fog.

Now for the fact—a few years since I was deliberating where I should place some early potatoes for seed, so as to keep them from frost, and from being mixed with other potatoes. I was advised to put them into a cellar, where there was a water cistern; this was the coldest cellar under my house. But I adopted the advice, and have pursued the practice ever since. On the 4th of January the water froze over in the cistern, and within two days the ice was from one to two inches thick. I then thought of my potatoes, and supposed them worthless. But they were not touched by the frost. Was this because the air conducted the heat from the water to the potatoes? If so, why did it not conduct the heat from the potatoes? Was it not rather that the water attracted the frost, if a material thing, with greater power than the potatoes possessed?

I have stated the foregoing facts, that you and your readers may make the most and the best of them, and not to support any vague theory of my own. And as it is not my intention nor wish to disturb the long repose of the theory alluded to, I will stop here, and subscribe myself, your obedient servant,  
A VERMONT.

Jan. 14, 1835.

P. S. Since writing the foregoing, the New-England Farmer of Jan. 21st has come. And to your annoyance, and possibly that of your readers, I have read the communication of A. G. in it, upon which I wish to submit a few remarks.

A. G. says, that the greater density of the air is the cause of the greater degree of cold in the valleys. I certainly shall not quarrel with this, for it is the only reason I have assigned for it in calm weather.

But I am not satisfied with his reasons for that effect. He says that air is a great conductor of heat. That is true. But how does this, by itself, account for the greater degree of cold in the valleys. From what, at such times, does it conduct it? As to this we are left in the dark. It may, if possible, conduct it from the frozen earth, colder than itself. But at any rate, the heat which it conducts from the frozen earth, must be in very small quantities, and a very cold kind of heat.

Although the air frequently robs us, in these hyperborean regions, of more heat than we well know how to spare, yet I doubt, whether we ought to charge all the inconvenience we feel from frost to the air.

A. G. says in answer to Mr. Breck's second question, that he thinks if there had been wind on Sunday morning there would have been very little difference in the cold, in the valleys and on the hills; and adduces theoretical arguments in support of his opinion. But these arguments are in direct opposition to the facts I have stated—facts well known in Vermont since the multiplication of thermometers.

The causes assigned for cold and frost are, generally, mere theory, and present the most complicated and disputable, as

they cannot be brought to the "searching" test of facts.

*By the Editor.*—The facts above stated by our respected correspondent, are, some of them, new to us, and the knowledge they convey may be of much practical utility in agriculture and rural economy. We do not, however, altogether coincide with him respecting the causes of some of the effects, which have met the attention of his observing mind. For instance, we believe that cold or frost is nothing but the want of or rather a less degree of heat. Likewise, we are of opinion that the heat given out by water while freezing saved his potatoes from frost. But we have not at present time nor room to give the reasons for our belief; and this is not of much consequence, since facts are of much more importance than theories. We hope, some time, to resume the subject, with allusion to the valuable facts with which we have been obliged by "A Vermonter;" and solicit the continuance of his favors of a kind similar to that for which we are already much his debtor.

[From the Cultivator.]

ROOT CULTURE presents many advantages to the stock farmer. Roots are less exhausting to the soil than grain; they are admirably fitted to form a part of a course of crops; are very beneficial in pulverizing the soil; afford abundance of food for grain; and serve to augment and improve the valuable product of the cattle yard. An acre of ground, under good culture, will produce, on a fair average, twenty tons of Swedish turnips, mangel wurzel, carrots, parsnips, or potatoes. Supposing a lean animal to consume one bushel a day, and a fattening animal two bushels, the produce of an acre will then subsist three lean bullocks 110 days, nearly the period of our winter, and three fattening ones 55 days. We merely assume these as reasonable data, and ask if the result does not prove the profitability of their culture. But we are not permitted to doubt upon this subject, if we credit the testimony of those who have tried them, and whose continuance in the culture is the best proof of their value. Roots enter largely into the system of Flemish husbandry, which has been extolled as inferior to none other; and in many parts of Great Britain, turnips are considered the basis of profitable farming. In our country, root culture is winning its way to notice and to favor. Few who have managed it judiciously have been willing to relinquish it; while others are annually commencing it. The great obstacles to the more rapid extension of the culture among us is the want of experience, the want of proper implements, as drill bars, rows, cultivators, &c., and the labor of securing the crop in winter. The apparent magnitude of these obstacles is daily diminishing, and we shall ere long discover, that root crops may be cultivated, and secured for winter use, as easily as other farm crops. We have had very little experience in cultivating carrots, parsnips or mangel wurzel, as field crops; but the Swedish turnip has been a favorite crop for some years; and we can truly say, it has been one of the most sure and profitable that we have taken from our grounds.

WINE FROM THE COMMON BRAMBLE.—Five measures of the ripe fruit, with one of honey and six of water, boiled, strained, and left to ferment, then boiled again, and put in casks to ferment, are said to produce an excellent wine.—[Rochester Industrial.]

NEW-YORK AMERICAN.

APRIL 4—10, 1835.

## LITERARY NOTICES.

**THE SACRED HISTORY OF THE WORLD.** By SHARON TURNER. Vol. 2d. HARPER & BROTHERS.—The continuation of this admirable series of letters, will be welcomed with pleasure by those who have perused the first volume of Turner's outlines, and appreciated the entertainment and instruction so solicitously blended in this excellent work. The volume before us carries on the investigation commenced in that which preceded it; and the chief object of its ingenious and learned author has been to observe and delineate the divine economy in its more special reference to mankind, and to exhibit the plans and principles and purposes which seem to have been pursued in respect to them and to the progress of human nature in their successive generations. The work is enriched by the most abundant illustration derived from the most diversified sources; and the fashionable productions of the day—the novels, poems, and travels of the last few years—have supplied the philosophical genius of the author with annotations not less striking than those which he often derives from the most celebrated ecclesiastical and pagan writers.—There are some minds which see good in every thing, which find flowers in barren places, and draw wholesome nourishment from sources which are only fraught with baneful properties for others. To such minds, when bent upon a task like that so happily accomplished by Mr. Turner, the familiar ways of life supply an inexhaustible store-house and armory; and while building up the monuments of religion from the very materials, often, that others have arrayed for its destruction, they meet infidelity where its attacks are most dangerous and insinuating, and crush the assailant, as it were, upon our own hearth-stones.

The following view of the position of our first parents in Paradise and of the nature of the trial to which they were subjected, affords a most simple, satisfactory, and beautiful series of comments upon one of the most important parts of the scriptures, and may be taken as a fair specimen of the style of the work before us:

But although the knowledge of what is good and evil in our actions and emotions is essential, both to right and conduct and to happy life, yet there is also another circumstance, which daily experience, with our own consciousness proves to be as indispensable, and this is SELF-GOVERNMENT; the power and will of spontaneous self-regulation; the habit of always doing what precept, information, and reason show us to be necessary. No one can doubt how impossible it is for any one to act morally or rationally, if this main element of all rectitude and comfort be omitted.

We see and feel its importance every hour. In the present age of the world, we are living, as it were, in an ocean of moral truth, ever flowing about us, and bathing our eyes, and ears, and intellectual feeling, wherever we move or act.—Every censure is precept, and who is without censurers? Every advice is tuition, and who is wanting in advisers? Conversation is mostly a series of criticism on others; and thus we are all lecturing and hearing lectures almost every time we meet. But does this influx and exercise of moral tutorage produce in any a correspondent rightness of conduct? Is this at any time proportioned to our knowledge of what it ought to be? Do we perform the things we ought to do, and abstain from what we ought not to do, because we are fully apprized of the duty, and of the consequences which will follow its neglect or infraction? The answer is patent to us all in our daily

memory and consciousness. We follow too much the devices and desires of our own heart. We have the abundant knowledge; we have even the convinced judgment; but we have not the necessary self-government. For this reason, we err and stray from His ways, who would by them lead us to increasing happiness. We offend against his laws, although their wise and benevolent operations would, if they were universally observed, soon expunge all evil from human life and human nature; and were meant and given to us to do. It is this want of self-government, which is the source of so much that is annoying and pernicious in every descendant of Adam and Eve. But it was as requisite to them as it is at this moment to ourselves. All laws, and precepts, and instruction, are but words without it. It must produce and therefore precede the obedience which is desired, and the moral conduct on all occasions, which will be so advantageous, and is to every one so honorable. It was, therefore, a foreseeing act of his divine wisdom, and not less of his philanthropy, that their Creator began his benign education of his new creatures, by the mild imposition of one command—whose direct object was, by an easy and daily effort, to lead them gently to the momentous habit of continual self-government; of restraining natural inclination by reason and recollection; of regulating their desires and gratifications, in conformity to rules and tuition; of feeling sensorial excitement, and yet of preventing it from overruling their will and from governing their conduct.

All intellectual life in human beings, or in any other, must be guided by the judgment and by moral principle, and therefore by continual self-restraint and by the proper modifications. How rigidly do we exact it from our domesticated animals; and to the credit of their self-government, and of their acquired habits of obedience, how much self-restraint do they not at least learn to exercise, and become in this respect a pattern to us their instructors!

To the human race self-government, according to appointed rules, to socially exacted observances, or to the due feelings and rights of others, is necessary every hour of our living day. It is not in what concerns property alone, or the use of our hands, or our inclinations and passions; but there are the temper, and the speech, and the behaviour to others, that require unceasing self-guard and watchful regulation, from the want of which, so many evils and so much provocation follow.

These certainties make it expedient that all education should begin with the injunction and practice of self-government; and by causing us all to be born as children under parents, it is naturally made to be so. They take care, as long as we are under their direction, that from our cradle until their instructing duty ceases, the habit shall be daily exercised by us; but Adam and Eve had no other parental tutor than their Creator, and it was expedient that they should be practised by him in this fundamental principle: with this view his command was given.

**THE PHILOSOPHY OF A FUTURE STATE.** By Thomas Dick. 1 vol. KEY & BIDDLE, Philadelphia.—The increasing popularity of the excellent author on this side of the Atlantic, has induced the publication of a uniform edition of his works, which, judging from the specimen before us, will be very handsomely executed. The works already prepared are—

THE PHILOSOPHY OF A FUTURE STATE.

THE CHRISTIAN PHILOSOPHER.

THE PHILOSOPHY OF RELIGION.

THE IMPROVEMENT OF SOCIETY BY THE DIFFUSION OF USEFUL KNOWLEDGE.

Those which are in a course of preparation are—The Mental Illumination of Mankind, or an Inquiry into the Means by which a General Diffusion of Knowledge may be promoted; and *The Scenery of the Heavens displayed*, with a view of illustrating the doctrine of a plurality of Worlds. The important and interesting character of these treatises will make them form a most

valuable addition alike to the library of the layman and divine.

**THE JUVENILE POPULAR LIBRARY—Domesticated Animals**, 1 vol; Jno. Allen & Co., Boston.—The habits of the brute creation supply an inexhaustible fund of interesting observation to those who will stoop from their "high estate" to study the humbler parts of creation. The dog alone—of whom an ungrateful anecdote has never been told—might make many a biped blush who should read his history in the entertaining little volume before us. But we fear that the long enumeration of his good qualities here, will hardly plead for him when the days of his evil star come round, and the Corporation fiat has gone forth. This work, like all that we get from Boston, is very neat in its mechanical execution.

**THE KNICKERBOCKER, OR NEW YORK MAGAZINE**, April 1.—Our two popular magazines for this month come to hand at the same time, but, as in duty bound, we give the first place to the elder of the two. The present number of the Knickerbocker, like those which have for some time preceded it, is enriched with articles from a great variety of popular pens—is exceedingly well printed—and contains more than a hundred pages of diversified reading. We select the following from several pieces of poetry, by Mrs. Sigourney, and others equally well known to fame:

## The Silent water.

BY THE AUTHOR OF 'GUY RIVERS,' 'MARTIN FARRER,' ETC

When that my mood is sad, and in the noise  
And bustle of the crowd, I feel rebuke,  
I turn my footsteps from its boisterous joys,  
And sit me down beside this little brook:  
The waters have a music to mine ear  
It glads me much to hear.  
It is a quiet glen, as you may see,  
Shut in from all intrusion, by the trees  
That spread their giant branches, broad and free,  
The silent growth of many centuries;  
And make hallow'd time for hapless moods,  
The Sabbath of the Woods.

Few know its quiet shelter,—none, like me,  
Do seek it out with such a fond desire,  
For, in its idle mood, on flower and tree,  
And listening as the voiceless leaves respire,  
When the far traveling breeze, dome wandering,  
Rests here his weary wing  
And all the day, with tangle ever new,  
And sweet companions from their fruitful store,  
Of merry elves, bespangled all with dew,  
Fantastic creatures of the old-time lore,  
Watching their wild but unobtrusive play,  
I fling the hours away.

A gracious couch,—the root of an old oak,  
Whose branches yield it moss and canopy,—  
Is mine: and so it be from woodman's stroke  
Secure, shall never be resign'd by me:  
It hangs above the stream that idly ples,  
Heedless of any eyes.

There, with eye sometimes shut, but upward bent,  
Sweetly I muse through many a quiet hour,  
While many a sense on earnest mission sent  
Returns, thought-laden, back with bloom and flower;  
Pursuing, though rebuked by those who morn,  
A profitable toil.

And all the waters, trickling at my feet,  
Wind on their way with gentler melody,  
Yielding sweet music which the leaves repeat,  
Above them, to the gay breeze gliding by,—  
Yet not so rudely as to send one sound  
Through the thick copse around.

Sometimes, a brighter cloud than all the rest,  
Hangs o'er the archway, opening through the trees,  
Breaking the spell that, like a slumber, press'd  
On my worn spirit its sweet luxuries,—  
And with awakened vision upward bent,  
I watch the firmament.

How like its sure and unobtrus'd retreat,  
Life's sanctuary at last, secure from storm,  
To the pure waters trickling at my feet,  
The budding trees that overshadow my form;  
So far as sweetest things of earth may seem  
Like those of which we dream.

Thus, to my mind, is the philosophy  
The young bird teaches, who, with sudden flight  
Sails far into the blue that spreads on high,  
Until I lose him from my straining sight,—  
With a most lofty discontent to fly  
Upward, from earth to sky.

W. G. S.

**THE AMERICAN MONTHLY**, for April, exhibits a marked improvement in its typographical department, and the reader will find in the present

number ample fulfilment of our prophecy, as to the literary merits of this Magazine. "The Chevalier Bayard and the Fair Widow," is a graceful and entertaining story, sustaining throughout an admirable tone of legendary simplicity. The article entitled "A Hundred Years Ago," is a great improvement upon what was well commenced in the last number, a comparative view of the world now, and a century since. The writer evinces unusual and varied erudition, and a witty, polished, and vigorous style. His promise of a continuation of his sketches, will, we trust, be fulfilled. "The Voice of the Steam-let," from the initials, we take to be from the pen of the clever and popular author of Guy Rivers. "The Gallery of a Misanthrope," we cannot altogether commend: it is outre and original to a degree that rather transgresses the rules of good taste; but it is written with decided vigor and power. "Public Instruction," noticing Cousin's work on the state of Public Instruction in Prussia, is a grave and learned essay, and exposes very cleverly our popular error in supposing the standard of education in this country to be more elevated than elsewhere; and points out deficiencies and evils, the correction of which requires vast and determined exertion.

"The Fortunes of the Maid of Arc," is one of the most brilliant sketches which we have seen from the pen of its brilliant author. We have often had occasion to commend his productions, and know few periodical writers who so uniformly sustain the interest and ability of their performances. The hawking scene, with which it opens, is worthy the happiest mood of the author of *Richelieu*. The other articles of the work, including the literary notices, we have not examined, with the exception of Benedict Arnold, which is a strong and manly paper upon the subject of American Biography, and which we should like to see followed up by others in the same vein.

#### FOREIGN INTELLIGENCE.

##### Thirty Days Later from Europe.

By the Roscoe, Capt. Delane, from Liverpool, 12th March, we have very late and interesting news. The Caledonia, Capt. Graham, of the 21st from Liverpool, and the Utica, Capt. Depoyser, of the 28th February, from Havre, have also arrived.

In addition to our regular files by the Roscoe, which are London to the evening of the 10th, and Liverpool of the 12th, inclusive, we have, through the politeness of Capt. Delane, a London paper of the 11th.

We find in the Liverpool Advertiser of the 12th March, the following extract of a letter from Captain E. Rossiter, of the Silas Richards, dated Studwall Road, March 3, 1835:

"It is with sincere regret I have to inform you of my being here. Last night, at eleven o'clock, off Wicklow Head, the night dark and blowing fresh, I came in contact with the brig Sarah, from Liverpool to Charleston, which vessel soon filled and sunk. I have the Captain, his wife, and eight of the brig's crew on board. I am sorry to inform you that we lost our bowsprit, there being a heavy sea on, the foremast, main topsail yard, fore topgallant yard, cross-jack yard, &c.; in fact the ship is a complete wreck in rigging, hull and sails. The sea was so high and the ship laboring so hard that there was no time to be lost in clearing the wreck. We therefore cut away as fast as we could; the only thing left to carry sail on was the main yard."

The Paris dates are to the 9th, from which we learn that the indemnity bill had not been acted

upon. It was, however, believed that it would be, and that the result would be favorable, although it is pretended that important documents are in the hands of the Duke of Fitz James, which had not been laid before the committee.

The French Ministry is again dissolved, and it would seem a matter of no small difficulty to re-organize it.

It will be seen that the PEEL Ministry have been twice defeated in the House of Commons; yet they, however, still retained their places, and Mr. Peel is reported to have said, that "he hoped and believed he should be able to carry on the Government."

A great effort has been made to repeal the malt tax.

##### DEATH OF THE EMPEROR OF AUSTRIA.

Later accounts than those contained in the following paragraph as will be seen, intimate a continuance of the long prevailing policy of Austria, and of the entire success of Metternich.

The *Moniteur* of Saturday, contains a telegraphic despatch from the French Chargé d'Affaires at Vienna, stating that the Emperor of Austria died suddenly at one o'clock in the morning of the 3d inst. He was in his 67th year, and had been Emperor, first of Germany and then of Austria, since 1804. He is succeeded by his son Ferdinand, now 42 years of age. This event, it is probable, will cause a great change in the future policy of the empire, as the present emperor is said to entertain a strong dislike against Prince Metternich.

The *Courier* of the 10th has the following rumor, which is fully sustained by the latest accounts from Paris.

"It is reported that accounts have been received from Vienna, by express, stating that Prince Metternich has received from his Emperor the same unlimited confidence shown to him by the late Emperor of Austria."

The Paris correspondent of the London Times points out a cause of difficulty amongst the Powers of the Holy Alliance.

The Presidency of the Germanic Diet, is now likely to set Prussia and Austria at variance. The mass of the Germans have long looked at Austria, whose possessions in Germany form but a small part of that empire, with great jealousy and dislike. By the true Germans she is invariably spoken of as not a German Power, and they desire to see the Presidency of the Diet conferred on Bavaria or Prussia. The claims which FRANCIS derived from his age, and from having been Emperor of Germany, will not devolve on his son, whose title to the Presidency may probably be disputed with success by either of the two other powers just mentioned. The Emperor of Austria cannot make up, we believe, by commanding talents, for want of the advantages possessed by the late Emperor. Prince METTERNICH will, of course, desire to retain the Presidency for Austria. We have both German and Dutch papers this morning, but they do not allude to this subject, and do not otherwise bring any intelligence.—[*Courier*.]

The London *Courier* of 10th March says: "We have received Lisbon papers to the 23d of February inclusive, which announce a change in the Portuguese Ministry, the particulars of which are stated elsewhere. The Legislature is carrying on its measures of improvement quietly. The Project of the Law for the sale of national property was still under discussion, as was a law for excluding from all their titles, employments, and decorations, several numerous classes of functionaries who served under the Usurper."

##### Opening of Parliament, Election of Speaker and Defeat of Ministers.

"Parliament was opened with the usual pomp and formality, on Thursday Feb. 26, by the King in person. His Majesty, on his progress to, and

arrival at the Parliament-house, was respectfully if not enthusiastically, received by his loyal subjects, who, whatever might have been their feelings, touching the recent exercise of the prerogative in the dismissal of the Melbourne Ministry and in the dissolution of the first Reformed House of Commons, never forget, even while disapproving and condemning those acts, that to William the Fourth the nation owes a debt of gratitude for his early, and for a time consistent, support of the cause of constitutional reform."

**SPEAKER OF THE HOUSE OF COMMONS.**—The Reformers carried their candidate for Speaker, Mr. Abercromby, by a majority of 10 votes, thus:—

For Mr. Abercromby, . . . . . 316  
For Sir C. M. Sutton, . . . . . 306

Majority for Mr. Abercromby, . . 10

On the announcement of the division, the cheers both within and without the House were deafening beyond precedent.

**SECOND DEFEAT OF MINISTERS.**—In the House of Commons February 26th, after a debate of three days, an amendment to the Address in reply to the King's Speech, moved by Lord Morpeth, was carried against Ministers by a majority of 7.

LONDON, Feb. 24.—This day his Majesty proceeded in state to the House of Lords, and delivered the following speech in a firm tone of voice.

"MY LORDS AND GENTLEMEN—I avail myself of the earliest opportunity of meeting you in Parliament after having recurred to the sense of my people.

"You will, I am confident, fully participate in the regret which I feel at the destruction, by accidental fire, of that part of the ancient Palace of Westminster which has been long appropriated to the use of the two Houses of Parliament.

"Upon the occurrence of this calamity, I gave immediate direction that the best provision of which the circumstances of the case would admit should be made for the present meeting; and it will be my wish to adopt such plans for your permanent accommodation of the two Houses of Parliament as shall be deemed on your joint consideration, to be the most fitting and convenient.

"I will give directions that there be laid before you the Report made to me by the Privy Council in reference to the organ of the fire, and the evidence upon which that Report was founded.

"The assurance which I received from my Allies, and generally from all Foreign Princes and States of their earnest desire to cultivate the relations of amity, and to maintain with me the most friendly understanding, justify on my part the confident expectation of the continuance of the blessings of peace.

"The single exception to the general tranquillity of Europe is the civil contest which still prevails in some of the northern provinces of Spain.

"I will give directions that there be laid before you Articles which I have concluded with my Allies, the King of the French, the Queen Regent of Spain, and the Queen of Portugal, which are supplementary to the Treaty of April, 1834, and are intended to facilitate the complete attainment of the objects contemplated by that Treaty.

"I have to repeat the expression of my regret that the relations between Holland and Belgium still remain unsettled.

"Gentlemen of the House of Commons—I have directed the Estimates for the ensuing year to be prepared, and to be laid before you without delay.

"They have been framed with the strictest attention to economy, and I have the satisfaction of acquainting you that the total amount of the demands for the public service will be less on the present than it has been on any former occasion within our recent experience.

"The satisfactory state of the trade and com-

merces of the country, and of the public revenue, fully justifies the expectation, that notwithstanding the reductions in taxation which were made in the last session, and which, when they shall have taken effect will tend to diminish the existing surplus of the public revenue, there will remain a sufficient balance to meet the additional annual charge which will arise from providing the compensation granted by Parliament on account of the abolition of slavery throughout the British dominions.

"I deeply lament that the agricultural interest continues in a state of great depression.

"I recommend to your consideration whether it may not be in your power, after providing for the exigencies of the public service, and consistently with the steadfast maintenance of the public credit, to devise a method for mitigating the pressure of those local charges which bear heavily on the owners and occupiers of land, and for distributing the burden of them more equally over other descriptions of property.

"My Lords and Gentlemen—The information received from the Governors of my Colonies, together with the Acts passed in execution of the law for the abolition of slavery, will be communicated to you.

"It is with much satisfaction that I have observed the general concurrence of the Colonial Legislatures in giving effect to this important measure; and, notwithstanding the difficulties with which the subject is necessarily attended, I have seen no reason to abate my earnest hopes of a favorable issue.

"Under all circumstances, you may be assured of my anxious desire and unceasing efforts fully to realize the benevolent intentions of Parliament.

"There are many important subjects—some of which have already undergone partial discussions in Parliament—the adjustment of which at as early a period as is consistent with the mature consideration of them, would, be of great advantage to the public interests.

"Among the first in point of urgency is the state of the tithe question in Ireland, and the means of effecting an equitable and final adjustment of it.

"Measures will be proposed for your consideration which will have for their respecting objects—o promote the commutation of tithe in England and Wales, to improve our civil jurisprudence and the administration of justice in ecclesiastical causes, to make provision for the more effectual maintenance of ecclesiastical discipline, and relieve those who dissent from the doctrines or discipline of the Church from the necessity of celebrating the ceremony of marriage according to its rites.
